have thrown so much discredit upon our manufactures. What are we to think of it all? When it suddenly turned out three years ago that the military stores of men and material upon which the French nation relied in its need had been adulterated on a gigantic scale, we acknowledged that defeat was a natural penalty for widespread corruption. If the English commercial system is tainted with a dishonesty so widely spread that the recollection of what honesty means is beginning to grow faint, may we not expect to meet some day with a catastrophe of a different kind, but not less startling or disastrous? The question well deserves examination by those who are interested in the matter and have the necessary means of information. We shall not attempt to say more at present than that some ugly symptoms undoubtedly exist. The complaint, indeed, is not a new one. Adulteration, though the art may have been carried to an unprecedented pitch of refinement, has probably existed as long as there have been such things as shopkeepers; and to justify any decided opinion upon the disease from which we are suffering, we should have to say whether it is becoming more virulent than of old, and is more prevalent amongst ourselves than amongst our neighbours. That the first of these propositions is true is indeed highly probable from general considerations, and may suggest to moral philosophers some curious speculations.

Ethical treatises and sermons of all kinds lay down moral rules in the most general terms. The commandment is that we should commit no murder, not that we should refrain from murdering a particular class of people. In practice, however, such laws are interpreted after quite a different fashion. We are always very slow to admit that we owe the same duties to all mankind. Everybody knows, for example, that the law against murder is frequently understood with strict limitations. A colonist in any wild country is very sceptical as to its having any application to aborigines. Or, again, to take a trivial instance, it is curious to remark the way in which a schoolboy interprets the duty of speaking the truth. The same boy who would be utterly ashamed of telling a deliberate falsehood to one of his companions would think it a point of honour to deceive his masters upon certain subjects. In short, moral sense in its rudimentary stages is generally identified with some class feeling. The savage may be strictly virtuous in his conduct to his own family or tribe, and regard the rest of the human race as standing altogether outside the pale of his sympathies; the artisan is equally sceptical as to his obligations to capitalists, and the shopkeeper about his duties to the whole world outside his doors. Now, whilst commerce has of late years extended with extraordinary rapidity, the development of a corresponding moral sense has by no means kept pace with it. A shopkeeper at the present day who should keep to the code of his grandfather, might in practice be a far greater rogue. Each of them would admit in terms that cheating was wrong; and each of them would in secret put in a saving clause to the effect that to sin really consisted in cheating your next-door neighbour. But then the grandfather lived in a world of next-door neighbours. He was a member of a small society changing very slowly, each of whom had not only a lively interest in his neighbour’s honesty, but had the power of constantly keeping an eye upon him. If a dairyman adulterated his milk, he got a bad character within a little circle beyond which he had no power of looking; and therefore he was pretty certain of suffering very rapidly for any offences he might commit. If fate had put it in his power to cheat a man living at the Antipodes, he would possibly have felt very little scruple about doing it, but then fate never did put it in his power. On the other hand, his grandson inheriting the same moral views has constant relations with the most distant parts of the world, and therefore constant opportunities of cheating people to whom he feels himself bound by no comprehensible tie. If he cheats his customers, he only cheats one of a crowd of people who are constantly moving, and of whom there is a very fair chance that he will never see anything again. The sufferers are persons of whom he knows nothing, who will probably not take the trouble to punish him, and whose anger cannot reach him for an indefinite period. He speedily reconciles himself to conduct of which he would see the dishonesty and impolicy if its objects were brought nearer to him. Indeed it may be said that, in some sense, the amount of commercial dishonesty is only a measure of the degree in which we can trust each other. There is so much cheating because there is so much credit. Mr. Montague Tigg very truly said to Mr. Chuzzlewit, that if you wrote your name in large letters over a door in a London street, and said that you were willing to take care of people’s money, a certain percentage of passers-by would infallibly turn in and press their confidence upon you. When that unlucky widow made her purchase of Wallsend coal, she put a certain amount of confidence in a man of whom she knew absolutely nothing except that he had the means of inserting an advertisement in the newspapers. She was foolish, as the events proved; but we are all of us every day trusting ourselves to utterly unknown people, with a confidence which is almost equally blind. A man with a tolerably good suit of clothes and a sufficient amount of impudence will find himself trusted everywhere to a marvellous extent on the apparently unreasonable hypothesis that clothes are a sufficient index to character. Experience on the whole justifies the confidence, and we make up our mind on the doctrine of averages that we shall suffer only a certain percentage of loss. The complex arrangements of modern society would not work for a day if everybody insisted on receiving legal proof of the respectability of all people with whom he has dealings. And thus we may even take some pleasure in the

increase of cheating, on the ground that it must repose on the increase of well-founded mutual trust. It follows, however, with equal certainty, that it is of vital importance not only to maintain the existing standard of morality, but to elevate it as nearly as possible to the point at which our confidence would never be misplaced; in other words, the safe development of commerce absolutely requires an improvement in the moral sense, whilst unfortunately it is too apt to produce rather the contrary effect. People are demoralized in proportion as they find that other persons trust them, instead of seeing the necessity of rising to the occasion. A merchant who has dealings in China hopes that he will have made his own profit before his goods have been found out; as the milkman calculates that he can afford to disgust several successive sets of customers before he will have exhausted the vast ocean of public credulity.

By what moral means the sense of honesty is to be increased is a tolerably wide question. But it is at any rate plain that we have one means of persuasion, of which we should take the fullest advantage. If the check derived from the personal inspection of a man's immediate neighbours tends to grow weaker than it was in simpler days, the action of legislation should grow more systematic and vigorous. A certain school of reasoners professes to be very much terrified by the dangers of excessive interference on the part of Government; but even they will generally differ from Mr. Bright in admitting that Government is rightfully employed in putting down dishonest trading. If a milkman or a coal-merchant is more independent of any given set of customers, his dislike to fines and imprisonment does not diminish. We are beginning to understand the importance of sanitary supervision, and to recognize the unpleasant fact that dishonest dealing may spread not only discomfort, but fatal diseases. A systematic attack upon the petty cheating which falls with special severity upon the poor who are unable to make an efficient protest, ought, one would think, to be a popular measure; and we can strongly recommend it to statesmen of all parties who are in need of a policy. We should only be disposed to add a hope that the net may catch the big fish as well as the small ones; and that whilst retailers of coal and milk are assailed, some thought may be given to the capitalists who on a larger scale are applying just the same principles of competition.

THE OLD AND THE NEW ERA OF SCHOOLS.

"TEN Thousand a Year" furnished a very fair title for a serial story a generation since, in the days when sensation novels were not. The words would scarcely stand as typical of an almost inexhaustible income in our own time, when the annual sum represents an ordinary week's takings in copper and small change by an Omnibus Company or an Underground Railway in London. It is not therefore a matter of any world-wide or national importance whether an amount of money which may be expressed by the same figures shall be annually expended upon the household management of Eton, or shall be left to "fructify in the pockets of the taxpayers" whose sons are educated there. It is very likely true that an addition of twelve pounds a year to the boarding-house charges for an Eton boy is not required by any financial necessity, and it makes a very good grievance, like a cabman's demand of a shilling more than his proper fare. But it may be assumed with equal probability that the pecuniary sacrifice is much of the same character as in the case of the cabman's shilling, and that a man who means to send his son to Eton as an Oppidan will do so with just as little hesitation if the new terms are enforced as he would if the old scale were maintained. The defence of the advanced rate of payment set up by one of its advocates in the *Times* is full of sound worldly wisdom, if it is rather deficient in logical coherence. "If a man thinks that Eton education is too dear, let him send his boy to another school. If he wants a good article in this world, he must pay for it." A cup of coffee in a restaurant west of Charing Cross costs twice as much as a cup of coffee which is just as "good an article" in a tavern east of Temple Bar. If you do not like the prices of the Opera Colonnade, you can sacrifice your dignity and go to Fleet Street. You must not expect fashionable charges to be lowered to your unfashionable requirements. This is a perfectly sound argument; and if the Eton dames and tutors think themselves strong enough to apply it in practice, they have a perfect right to make the experiment. That any one of their number should have come forward on behalf of the rest to brave the inevitable storm of correspondence and abuse which has actually arisen, would have been an act of admirable, but useless, heroism; and that the "private and confidential" circular should have been issued without signature is so much a matter of course that no defence of it has been offered or required. The issue of this particular dispute does not much concern the nation; but that the question should have been raised is, we think, a straw which shows the direction of a current which it is both of interest and of importance to observe.

There were formerly, as we have all heard, three learned professions. How many more may now exist we need not stay to count; but among those which are fully recognized, the work of teaching as a calling in life, and as an opening by which a man may enter upon what novelists describe as a career, has come forward of late years into a very prominent position. We do not refer to the army of certificated elementary teachers, who may sometimes provoke a good-humoured smile when they speak of themselves as "the profession"; nor to that miscellaneous crowd of both sexes

who advertise suburban "academies" and "establishments," and who consider themselves to be of "the scholastic profession"; but to that large and increasing number of men, the pick of our Universities and public schools, who twenty or thirty years ago passed usually from their degree to a curacy, and who now are "going in for masterships" instead. They are the creation of the modern public school system, and they are extending the system which has created them. For the most part they look forward to spending their lives as schoolmasters, differing in this respect from the junior college tutors of the last generation, who were all Fellows of their Societies, and either actually, or intending to be, ordained, with the prospect of a College living in due time. These men obtain, and they deserve to obtain, a scale of stipend which it is impossible for the benighted clergy to offer to their assistant curates; and the public school and University classman who twenty years ago would have accepted a curacy with a hundred a year as a matter of course, will now find himself, if his previous character and reputation have secured for him the necessary recommendations, able to choose between several offers of assistant-masterships with stipends of about double the amount. To understand the rise and growth of a system which requires a large and increasing demand upon the resources of the upper and middle ranks of society for its maintenance and extension, we must look back upon the state of things out of which it has arisen, and which it has in great measure already superseded. It has probably passed out of the memory of the present generation that all schools were formerly under direct ecclesiastical control. The Canons of 1603 provide that "no man shall teach either in public school or private house but such as shall be allowed by the bishop or other ordinary." The parish clergyman has priority of claim to be so licensed, except in "towns where there is a public school founded already," in which case the schoolmaster is to have a monopoly "to teach grammar"; but all schoolmasters are to "teach the grammar set forth by King Henry VIII. . . . and none other." Education being thus in effect restricted to the clergy, the usual rule in the foundation schools, which has obtained down to the present time, has been that a clerical head-master for the upper school, and a second master, frequently a layman, for the lower or elementary school, have been appointed by the governing body or trustees; and the assistant-masters in the larger schools have been an after-growth, which may be described as consisting of "members not on the foundation." In every important town the head-master of the grammar school was a personage of much local consideration, but the title of "public school" given by the Canons to all these foundations became in practice restricted to a very few of the more distinguished schools in or near London, together with Eton and Winchester.

The bitter and vehement denunciation of public schools as places of education which forms the subject of Cowper's *Tirocinium* was written in 1784, when the poet was fifty-three years old. His own personal experience had been gained during four or five years ending in 1749, when he was a boy at Westminster. He was horribly bullied there, no doubt; but whether or not the public schools of the eighteenth century were the nurseries of vice and toadyism which he describes, or their masters deserving of the heavy charges which he brings against them, it is certain that his fierce invective was largely taken for truth, and brought public schools into great and lasting disfavour with what was then known as the religious world. In the dedication of *Tirocinium* to Mr. Unwin, Cowper describes his poem as "recommending private tuition in preference to an education at school"; for, with a genuine public school man's instinct, while he abuses "Royal Institutions" he cannot resist the temptation to a back-handed blow at "small academies." These private schools, which had naturally grown up in spite of the Canons, do not by any means shine in the contrast. Mr. Wilberforce's experience of one of them in 1768, where the "Scotch master" and his "red-boarded Scotch usher," who "scarcely shaved once a month," "taught everything and nothing," and where his "nauseous food as a parlour boarder" made him sick, may serve as a genuine companion picture to the well-known description of about the same date in the *Figur of Wakefield*:—

I have been an usher at a boarding-school myself; and may I die by an anodyne necklace, but I had rather be an under-turnkey in Newgate. I was up early and late; I was browbeaten by the master, hated for my ugly face by the mistress, worried by the boys within, and never permitted to stir out to meet civility abroad.

The position of the usher or assistant-master in the clerical private schools which are remembered by men not yet past middle age was little better than this. He was frequently an under-paid and under-educated man, with no manners or refinement, looked upon as little more than an upper servant, and the butt of the boys. There were, no doubt, bright exceptions to this unsatisfactory picture. The personal memory of Dr. Corrie, an eminent private schoolmaster near Birmingham at the close of the last century, has passed away with his last surviving pupils; but his letters, preserved among their most private papers, remain to justify the affection and respect with which he was remembered by them. The private schools were themselves confessedly kept by clergymen as a means of obtaining an income, and their cost varied from the cheaper and rougher kind of establishment, where the charges were at least as high as those of the less expensive of our modern public schools, up to the style of treatment represented by "three hundred a year, and wine every day after dinner," by which mamma's darling was supposed to receive a superior education

combined with all the comforts of a home. Happily for the boys of our own generation these gentlemen and no-gentlemen are almost universally extinct, and private tuition has become the exceptional resource where, from illness or other causes, a public education is not possible. The public school has dried up the educational fountains of the rural parsonage, and the miserable usher of a few generations back is replaced by the refined and cultivated assistant-master of to-day. All over the country old grammar schools have been revived and expanded, and new schools have been founded where the old endowments were either not existing or not available; while the higher class of private schools have themselves become almost incorporated with the general system, by being made preparatory for the public schools, on the principles of which they are conducted. The boys who, as we noticed in a former article, used to fill the lower forms of a public school, now enter a preparatory school at nine or ten, passing from it usually at thirteen or fourteen. For these, as well as for the higher schools, a constant and increasing supply of assistant-masters is required, who as they grow older look forward, if they are successful in their work, to becoming in turn house-masters and head-masters in the advanced, or heads in the preparatory, institutions. They are labourers worthy of their hire; and it is idle to expect that work like theirs will be carried on unless, to put it in the plainest possible language, it is found to pay well. A school-master has a right to find in his profession the same rewards which other professions have to offer, and in the same gradations of value. The old endowments, however well administered, can only very partially supply these rewards, which must in some way or other come, like barristers' or physicians' fees, out of the pockets of those who are benefited by the work done. The details of any such arrangement may afford material for newspaper correspondence in the holidays, and will be decided according to circumstances by experience and practical good sense.

Among the maxims of unwisdom which the recent "Eton Dictary" discussion has added to the popular store, perhaps the palm should be assigned to the discovery that the most expensive school is bound to supply the highest education; with the inference that, if Eton education is found not superior to that of ordinary grammar or other public schools, its charges ought, by the operation of some moral law, to be brought down to the level of theirs. This may be a natural reaction from the tenet of a century since—"The parson knows enough who knows a duke"—and it may be said to represent the principle of competitive examination gone mad. If a higher culture is to be looked for in the Guards than in the Artillery; if Christ Church ought to leave Balliol nowhere in the class-list; if peers and country gentlemen of great estate are bound to outshine intellectually all the leaders of the Bar, all the lights of the scientific world, and all the literary men of their time, perhaps we might receive the maxim with respectful attention. As things are, we must confess, with one of Alice's friends, "Well, I never heard it before, said the Mock Turtle, but it sounds uncommon nonsense." So long as English society is what we see it, Eton is a social necessity which, if it did not already exist, would have to be invented. If there are to be large classes possessed of immense hereditary or accumulated wealth, there will be a scale of living and expenditure proportionate to the income, and boys will grow up accustomed to the condition in which they were born. They will take to school the habits which they bring from home, and there must of necessity therefore be some one or more schools where the general tone will sanction, if it does not actually require, expenses and customs which in the case of families of moderate means would represent culpable profusion and extravagance. If Eton fixed charges are high, or, being high already, if they are increased, so also were the charges of the small private schools of a former day where pupils paid from two hundred to three hundred pounds a year, and spent and did very much what they pleased. The state of society which made and makes such distinctions possible may be as objectionable as Communists and Land and Labour Leagues assert, or it may not; but it exists, and no amount of crying in the wilderness will make it in its details other than consistent with itself. The particular question, therefore, which has arisen out of the Eton Circular appears to us to be one of the slightest possible moment. But the attention which it has excited is an indication of the growing interest which attaches to everything connected with the working of our public schools; an interest which is itself the result of the steady and successful advance of the higher education in that new era of which the leader was Dr. Arnold, and of which successive school generations of his disciples have been pioneers. There was a gleam of hope even in the dark vision of Cowper, which the last lines of the *Tirocinium* reveal:—

And though I would not advertise them yet,
Nor write on each—This Building to be Let—
Unless the world were all prepared to embrace
A plan well worthy to supply their place;
Yet, backward as they are, and long have been,
To cultivate and keep the morals clean—
Forgive the crime—I wish them, I confess,
Or better managed, or encouraged less.

It is the "Exornare aliquis" of the public school-man of the last century, and it is receiving its answer in our own.

DUAL GOVERNMENT IN THE FRENCH ARMY.

WHATEVER faults the French may have committed in commencing or continuing the late war, however inadequate their means proved to sustain the duel they had provoked, no one will deny that their errors have been equalled by the candour of the revolutions since made as to the vices of the system that ruined for this generation their national reputation for arms. We in England have some records to show of a similar character. Few of us that are in middle age can have forgotten the vigorous zeal with which a Parliamentary Committee undertook to expose the causes of our Crimean blunders, and how intense was the indignation moved by the discovery that an unpractised war administration, long taught in peaceful days to keep itself and its charge in the background, had supplied unroasted coffee to soldiers who had no means of roasting it for themselves. Indeed we have but recently had an Abyssinian Committee, when peace advocates, at their wit's end for a cause of quarrel with our bloodless triumph, ransacked India and England to find evidence of waste in the fitting out of the expedition. They took little—it may be observed by the way—by their pains on that occasion. The brilliant success which restored our reputation for energy and prowess in Europe, and proved our far-reaching power in the eyes of the astonished East, was instinctively felt by the nation to be well worth the price that was paid for it. Yet the Parliamentary process was put on elaborate record, and serves as a fresh warning to those who conduct our affairs abroad of the searching investigation to which their proceedings are liable, even when carried to the happiest conclusion.

But the French have of late far surpassed us with our own weapons in this matter of research. The Parliamentary inquiry into the causes of the Communist insurrection will form the basis for all future histories of that feverish movement. And the rude method of making war which was employed by the Government of National Defence so largely as to prove to all time the hopelessness of mere patriotism or fervour for the winning of victory in these days of scientific soldiery, has been thoroughly searched into, and all its coarser and meaner features effectually brought to light, by the famous Committee on War Contracts, his speech on which made the Duke d'Audiffret-Pasquier one of the foremost men in France. It was not surprising that an Assembly which loves the late Imperial régime no better than the despotism of "the young Dictator" that succeeded it should have resolved to carry the same weapon of research and evidence against the war administration of Napoleon. Immediately, therefore, after that historic speech and its accompanying revelations, the National Assembly voted a similar Committee of Inquiry into the administration of the War Office before the war, a resolution which was shortly afterwards modified into entrusting the business to the same body which had dealt so effectually with the proceedings of the Government of Defence. Again it fell, naturally enough this time, to the Duke's share to bring up the Report which closed the inquiry; and although his speech was on this occasion delivered in comparative privacy, before only the members of the Committee and the chief officials of the War Office summoned by them, it has since been published in full, and now lies before us. We may say at once that it is as much more important than his former and more famous discourse as the vices of an established and apparently triumphant system are more serious evils than the blunders of a temporary administration. With this brief preface we proceed at once to its substance.

The instructions of the Committee comprised three principal heads. They were to inquire into the state of the war material as it existed in July 1870; to ascertain how it had been expended during the war, and how the present condition of the arsenals could best be verified; and to send to the special professional Commissions sitting on the reconstruction of the army and of its civil branches some definite recommendations as to the means which the War Office should in future employ for preventing a recurrence of the lamentable wants which the first pressure of the struggle made known. It was in the nature of the circumstances that such an inquiry should range over a wide field; but it is due to the members to state at once that there does not seem to have been, from first to last any unfair design to strain their powers against particular persons, or even to blacken the administration of Napoleon beyond its deserts. So far from this, the result of their work is to prove incontestably that one of the most prominent of the faults of organization charged on that Government was in truth the heritage of centuries of mismanagement in the conduct of the French War Office, and dates at the latest from the days of the Grand Monarque.

Two prime evils, the Report states, are chargeable with what was really lamentable in the condition of the war administration of 1870. The one was that, although centralization abounded in the sense of a check being constantly maintained by each chief over his immediate subordinates, there was no real independent audit or control in the way of actual inspection of the vast property of the department. The other, and that to which the chief part of the Report is devoted, is characterized by it as very much the graver error of the two. This is the dual government of the army, arising out of the independence of the administrative departments of the military command.

It will surprise many Englishmen to hear that this latter evil, which we have lately discovered to be engrafted on our whole military administration, and which it has become an object of almost national desire to extinguish, is in this Report declared

to be the disease which paralysed the whole fighting power of France. But it will surprise Frenchmen themselves to learn that it has existed in the French army ever since the days of that much-lauded organizer, Louvois, if not before them; and that Turenne, for example, had not less cause to complain of his operations being paralysed by those who were sent nominally to assist him than MacMahon. But so it is. The Report has gone into the history of this question as it never was studied before, and affords incontestable evidence that civil Ministers of War, intriguing for their own personal ends under despotic kings, were just as ready to maintain an independent authority within the armies they sent into the field, by the secondary agency of their administrative departments, as any of their successors, down to Freycinet himself, under the various Constitutions and Republics which have replaced absolutism in France without getting rid of its blunders.

So far as the origin of this dualism does not lie in the nature of men, it is traceable directly to Louvois. During the wars of aggression carried on under that Minister, he appears systematically to have used the newly-created functionaries called Intendants as his personal representatives, apparently as being more workable and subordinate creatures of his will than the victorious generals at whose sides they were placed. Now it is the younger Coligny who is found writing in bitterness after an unsuccessful dispute with his Intendant:—"I am confirmed in the idea that, if one is not the humble servant of the Minister, it is lost time to follow the service of the King. Surely I could manage the King's finances quite as well as the Marquis d'Effiat, who was formerly nothing but an ensign like myself." Then it is Vauban, engaged for two years in a struggle with the newly-made Intendant of Alsace, and only coming out of it victorious by the aid of his cousin Colbert. Next the Marshal de Créquy is found writing of the claims of his Intendant:—

He wants to have the fixing of the requisitions, to give orders for the raising of fortifications, to order the supplies of powder and of workmen, to lay on contributions without any agreement with the Marshal in command, to regulate the whole of the subsistence, to punish those who disobey the royal orders, possibly even to fix the quarters of the troops. Now that is what I call commanding.

Then Turenne says of the same Intendant, one Charruel, that he declines to receive him for his army. "I have a way of life," says the famous Marshal, "which prevents my understanding things properly when people do not act honestly."

The Report here, as well as the Duke's speech, speaks of necessary abridgment; but several pages of close print are devoted to the historical proof of the early date of the double government of the French army, the rest of which we must pass hastily by, with the single remark that the case is abundantly demonstrated. Nor does the administration of the Revolutionary armies of the Year III. fare better when examined: for there the contradiction was openly established by a new law of Commissaries of War theoretically supreme over the army, and independent of the military law which governed its members, and who yet, in the very next article of the same law, are held responsible that they obey every written order of the general to whom they are attached. Under such legislation the double government of Louis XIV. was continued, and Napoleon, it is observed, found this vicious dualism in full bloom. He made no theoretical protest against it, no reform in its written conditions; but under him the subjection of the two elements to his own personal authority as head of his army was so complete, and his mastery of details so perfect, that no practical difficulty ever arose. And his chiefs of corps, following the same unwritten rules on which he acted, had their own way in all important matters, the civil branch ceasing its old attempts at supremacy. As the Report puts it, under them the theory remained, but the letter of independent civil administration died, and with it the dualism complained of, which throughout the days of the First Empire had no practical existence at all. It revived, however, under the Restoration, when all sound military principles were laid aside in the reaction from the pressure of a long war, and it has borne fruit in the condition of things which proved so fatal to Frenchmen three years since.

Must we then for ever be looking to the foreigner for our model? Is there no example within France herself of a better administration for her to follow? asks the Report, or rather the Duke Pasquier himself, in illustrating its recommendations. Yes; one exists with us, he answers, which is the work of ages, and which has stood the utmost strain of late, being as incontestably sound in principle as that of the War Office is hopelessly wrong. The management of French naval affairs, in his view, is based on a system which leaves hardly anything to be desired. The Minister of Marine knows nothing of this pernicious dualism in his department. On the contrary, he delegates large powers to the Maritime Prefects (or Port Admirals) who serve under him, rendering them however most strictly responsible for their proper exercise. The result is that the naval force of France has proved not only to be in a state of high efficiency, and far superior to that which it might have been called on to meet, but was able to lend a liberal hand to the commissariat of the suffering sister service in its need. And this was done without extraordinary stores of provisions being maintained in hand. On the contrary, it has been the practice of the Maritime Prefects to keep only six months' supply of perishable articles for their commands in advance, trusting to free marketing, ready-money payments, and the practice of the business for replenishing their stocks as required. Hence their contracts during the war proved to have been in many cases made at rates below those current during the preceding peace, whilst of the quality there was never a complaint.

The conclusions of the Committee on this head, if carried out, will make short work of the dual War Office system which has hitherto victimised the French soldier. They are simply these. The administration or civil service of the army belongs to the command; but for the actual carrying it on special branches must be maintained—in all cases, however, placed immediately under the military head. Abuse of the joint power need not be feared if a system of intelligent accountability be established, carried on under a real Control, a body which shall check but not administer, its officials being altogether independent of and kept separate from all executive functions, and directly responsible to the War Office, for which they will audit the accounts and take stock. An elaborate scheme for this new form of the Control Service—a very different sort of thing from the jumble of civil sub-departments on which Mr. Cardwell has conferred that unhappy name—is given with the Report. We do not propose to follow it here; it is enough for the present that we have indicated the functions to which the direct representatives of those charged with the care of the national purse are in future to be confined.

OPPOSITION HORRORS.

AMERICANS sometimes display an uncomfortable eagerness to show that their country is in all respects on a level with, if not in advance of, England. An Englishman conversing with an American at Ratishon remarked that it was strange that in an out-of-the-way and old-fashioned German town he had seen upon the staircase of an inn a portrait of Faugh-a-Ballagh, winner of the St. Leger Stakes at Doncaster in 1844. The American answered that he had seen in another part of the same staircase a portrait of a celebrated trotting-horse of his own country. It will gratify Americans of this eminently patriotic character to learn that, almost simultaneously with the finding of remains of a woman, apparently murdered, in the Thames, remains of a man, apparently murdered, have been found in Oyster Bay, Long Island; and we may add that the *Daily Telegraph* on one side of the water and the *New York Herald* on the other are improving with equal assiduity these opportunities for the display of their peculiar talents. It appears that a young man named Kelsey, who dwelt in "the quiet, old-fashioned town" of Huntington on Long Island, paid "obtrusive attentions" to Miss Julia Smith, and was tarred and feathered as a punishment by the lady's friends. Some time afterwards Kelsey was, as is supposed, murdered; and remains identified as his have been discovered in Oyster Bay.

The *New York Herald* of August 31 was able to occupy the Sunday leisure of its readers with several columns of narrative and descriptive writing headed "Odd Resurrection. Only half of the turred and feathered victim recovered." The writer took at first the view that tarring and feathering a gentleman who was troublesome to a lady was "a transient explosion of savage barbarism" which would rest like a black shadow over the fair and placid fame of Huntington for all time to come. Subsequently, however, the writer became aware that the Huntingtonians were by no means ashamed of inflicting a punishment which he admits was deserved, and he even discusses the propriety of an alternative punishment which in an English town might be thought indecent. However, "so calm and peaceful was this old-fashioned village, with its great languid willow-trees, its quiet, slumbering cottages, and its easy-going, contented, and Christianly people," that gradually the question whether Kelsey ought to have been tarred and feathered, or whether he ought not rather to have been hanged, began to lose its interest. The lady who repelled Kelsey's obtrusive attentions recovered by the agency of time from "the harassing woes" of investigation, which means, we presume, that she was "interviewed" by the reporters of all the newspapers in New York. Her name, as already mentioned, was Miss Julia Smith, "a lady of much personal attraction, sensible, and self-contained." Her ancestors sleep "in the old Presbyterian cemetery," where, from an eminence overlooking the village, the tomb of all the Smiths looks down on Huntington. By birth, education, wealth, and culture she ranked first in the village estimate of aristocratic respectability. A short time since she married Mr. Royal Sammis, who, along with Dr. Banks of Huntington, was indicted for assault on Kelsey and held under bond. Soon after the tarring and feathering Kelsey disappeared, and the "primitive peace" of Huntington was disturbed by the controversies of three conflicting parties, one of which held that he had committed suicide through shame; another that he was alive and would some day turn up "under the willow-trees"; and the third that he had been murdered to prevent his revenging himself on his persecutors. However, time and the languor of the willow-trees were lulling these discussions to repose when suddenly "the whole exciting subject" comes up with tenfold more intense and painful interest than ever. The lower half of a body has been found, and it has been identified as that of Kelsey by a watch-chain in the trousers pocket. There is, however, a party in Huntington which denies the identity, and alleges that this is "a put-up job," undertaken to earn the reward offered by Kelsey's family for the discovery of his body. Considering that Huntington is a small town, and that Kelsey's family have breathed its air for six generations, the writer is not surprised that the townsmen talk of nothing else, and we are not surprised that he listens and repeats all he hears. The old story of Kelsey's "fanatical love" for Miss Julia Smith was gone over in every detail.

"People came into town from many places around to relieve themselves on this subject alone." The writer has collected from these discussions that Kelsey was a "light-bellasted" young man of twenty-eight years who wrote verses and believed himself a poet. His physique was poor, one shoulder was several inches higher than the other; his eyes were weak and uncertain, and his voice had no quality of strength or melody. He fell in love with Miss Julia Smith, wrote verses to her, and afterwards obscene letters. He prowled at night round her house, and once climbed into her bedroom, where he found a married lady who put him to flight. Mr. Royal Sammis, who was engaged to Miss Smith, told Kelsey that he would "fix" him. On the night of the 4th of November last a number of inheritors of the "fair and placid fame" of Huntington ennobled Kelsey by a mock invitation from Miss Smith, stripped him naked, covered him with tar and feathers, cut the hair off his head, and by the light of a lantern exhibited him to the ladies (Miss Smith among the number) in the backyard of the house in which she lived.

At this point the writer suspends his narrative, and becomes judicial. Had this tarring and feathering been perpetrated "out West" he would not have been surprised, but that so barbarous and brutal a punishment should obtain the sanction of people "who are heirs to two hundred years of the New World's civilization, church-going people of calm behaviour and gentle accents," passes his belief. Three days afterwards, however, he had been so far influenced by the public opinion of Huntington as to admit that the tarring and feathering would have been justifiable if done in daylight, and he mentions without disapprobation that alternative proposal of punishment to which we objected as indecent, being at the moment unaware that the punishment actually adopted involved the exhibition of Kelsey to the ladies, including Miss Smith. It is asserted by Kelsey's friends that Miss Smith encouraged his advances; but this she denies; and as she "bears the manner and well-grounded reputation of a sensible, modest, and scrupulously correct young lady," the writer thinks she ought to be believed. It is interesting to know that in America a young lady may see a troublesome lover tarred and feathered without detriment to her character for modesty and correct demeanour. The writer now changes the judicial mood for the sentimental. "It is a sad tale all through. It has drawn down a dark cloud over several households. It has made the village of Huntington, erstwhile the calmest, loveliest, and most peaceful place on Long Island, a seat of unholy discord and wretched recriminations." The murder is supposed to have been committed on the night of the tarring and feathering, which was the 4th of November, and the remains were found in Oyster Bay on the 30th of August. The tale of the discovery of the remains was told by the "simple oystermen" with a frankness that carries conviction with it. The epithet "simple" is probably a mere poetical embellishment; for the writer appears to contemplate that these same oystermen might be capable of a "put-up job." To call an oysterman on our own coast "simple" would be nearly as absurd as to apply the same epithet to a Scotch shepherd. The writer proceeds to describe the finding of "a body with nothing but the thighs left." The *Daily Telegraph* has taught us that it is our duty to study the details of our own murders; but we are not aware that the obligation extends beyond English land and water. We shall therefore pass over the oystermen's story with the remark that it is calculated to excite unpleasant reflections in the minds of consumers of oysters in New York. The inquest resembled a similar proceeding in England, except that "there came into the court-room a lady of ponderous dimensions, elegantly dressed, and evidently a person of refinement." This was a clairvoyant, who had told Kelsey's family that he had been murdered, and had predicted the finding of his remains.

The dwellers around Huntington restrained their curiosity on Sunday. As the writer puts it, "They stayed at home and read their Bibles," but they could not command their thoughts. On Monday the excitement was more violent than ever. A proposal for lynching the suspected murderers was started, and with difficulty suppressed. Next day the writer seems to have fallen under the influence of the "tar," or aristocratic party in the town, and he arrived at the conclusion that they are a meek people in Huntington, who spend half their lives in the shadow of their churches, and that Kelsey deserved tar and feathers, and in any other place would have got them, or worse, long before. He proceeds to correct his first hasty and imperfect statement. "This was not, as I was led to believe, a young man. His age was forty—a period of life when, as a rule, the amorous currents are subdued." He had become satisfied that Kelsey sent not only poetry, but indecent prose, to Miss Smith, and in some of his letters to her he answered imaginary letters received from her. Mrs. Oakley, grandmother of Miss Smith, "a noble-looking old lady, with the silver frost of seventy years whitening over her calm and colourless forehead," was advised to take legal proceedings against the supposed writer of the letters, but declined. Miss Smith, "a petite, gentle girl, timid and bashful as a fawn," was horror-stricken at the thought of going into court, and having the "hallowed privacy" of her innocent domestic life made public. It does not seem to occur to the writer that "hallowed privacy" could be any bar to the interview which, of course he sought and obtained with Miss Smith. It is, to our thinking, strange that the writer should suppose two ladies whom he describes in these terms capable of placing themselves on a verandah so as to command a view of a man who had been tarred and feathered in their back-

yard. Mrs. Oakley herself explained to the writer that there was "a great misunderstanding" as to this point. It is true there were ladies in the house, and she mentioned four. She was apparently giving a tea-party on the occasion. "All she saw on going out on the back porch was the top of his head." The ladies were there for only a few minutes. "The purpose of their going out was to make the man feel the disgrace of his situation." The writer spoke to more than one gentleman of the town who happened to come into Mrs. Oakley's backyard immediately after the tar and feathers had been applied, but nobody had the least notion who actually did the deed. But upon the question who contrived it Mrs. Oakley's tea-party is a suggestive circumstance. This is how they do things under the willows of Huntington, in that quiet old-fashioned place where people read their Bibles and abstain from gossip on Sundays. The writer was permitted to see, not only Mrs. Oakley, but Mrs. Sammis, lately Miss Smith. "She was modestly and becomingly dressed, and the bashful look in her fine, lustrous brown eyes told of the domestic and religious training she had received." The writer's perception of the suitability of the discipline of tar and feathers to the case of Kelsey had evidently been assisted by the "fine, lustrous brown eyes" of Mrs. Sammis. The same influence may be found in the statement that it is now supposed (that is, by the "tar" party and the writer) that Kelsey had left Huntington for ever. When Mrs. Sammis "looked straight out of her deep liquid eyes with a fearless simplicity," the writer doubtless inclined to the opinion of those medical witnesses who declared at the inquest that a pair of legs could not float without a body. The inquest has not finished, but a day had been fixed for the funeral, which was expected to be the largest ever held in the county. Two Presbyterian clergymen had been appointed to conduct the religious ceremony. The writer had had an interview with Mr. Sammis, who, as might be expected, happened to come into Mrs. Oakley's backyard immediately after the tar and feathers had been applied. Mr. Sammis is good-looking, and bears a high character with his employers in New York. He is perhaps lucky in being married to a wife who has fine, lustrous brown eyes. The writer was evidently prepared to find a verdict that Sammis was not guilty of the tarring and feathering, and that it served Kelsey right.

The *New York Herald* of later date informs us that a funeral service, which included two sermons or orations, had been performed in the presence of a "serious and earnest crowd." The writer is anxious to state that before Kelsey was exhibited to the ladies a cloth was tied round his waist. He had conversed with a member of the "anti-tar" party, who told him that the rival faction "all belong to our church and Sunday school, and never get drunk nor taste a drop of anything stronger than green tea." If they took a little gin, perhaps they might explain how the whole thing was done. But they say that "none of 'em had nothin' to do with it. They was just a lookin' on, and some darned cusses from the country come along and did the job." The writer remarked that men of such respectability, so meek and guileless and pure of heart, could not be supposed to meditate anything like murder. His informant answered that perhaps he never saw an Indian war dance. "It is as quiet as a Quaker meetin' in the start, but when the sport's up, and the hollerin' begins, and the tommyhawks git a flourishin', you may jest look out for some lame Ingins thereabouts." That's the way the Indians do, and we are all human nature.

A NEW WAY TO PAY SMALL DEBTS.

THE demand that the working classes should be relieved from the criminal penalties attached to conspiracies for the purpose of intimidation or coercion has just been followed up by a proposal that they should also be enabled to refuse to pay any debts they may incur without running the risk of imprisonment. Singular as it may appear, a Select Committee of the House of Commons has been persuaded to lend its countenance to the second of these propositions. The Report of this Committee is certainly a remarkable example of Parliamentary wool-gathering. As an exercise in English composition it is deplorable, and the reasoning is on a level with the writing. We will endeavour to convey some idea of this singular document. The Committee have come to the conclusion that imprisonment for small debts ought to be abolished, and the following are their principal reasons for this recommendation:—

1. "That the administration of the law relating to imprisonment for debt by County Court judges is unequal and uncertain in its results." This observation applies more or less to the administration of law in all its branches. There are no means of obtaining absolute equality and certainty even in the case of judges of the highest class; but it has not yet been proposed on this account to abolish all law. The inefficient administration of a law is an argument, not for its abolition, but for the appointment of more capable or careful administrators.

2. "That the mode of procedure on judgment summonses does not ensure sufficient evidence of the means of payment of the debtor, especially with regard to his indebtedness to other creditors, being brought before the County Court judge before entering an order of commitment." This is only a way of saying that the County Court has no machinery for seizing small estates of a few shillings or a few pounds, and dividing them among creditors, and the Committee do not venture to recommend such

an obvious absurdity. As the law at present stands, it is first come, first served. If a debtor has had a judgment against him, and if, having the means to pay the debt, he refuses or neglects to pay the same, he is liable to imprisonment. The debtor is required to pay his creditors in the order in which they sue him, until his means are exhausted; if he can prove that he has no money left, he cannot be imprisoned.

3. "That the numerous commitments to prison in default of payment of small debts entail an expense upon the taxpayers and ratepayers of the country which it is unjust and inexpedient that they should continue to bear." The refusal of a debtor to pay a debt which he has the means of paying is a criminal offence, and it is difficult to see why it should be more unjust that the community should bear the expense of punishing offenders of this class than the expense of punishing other offenders.

4. "That there is inequality in the law in relation to the remedies against debtors for large and small sums, which presses with undue severity upon the latter." It is true that there is no bankruptcy system for small debtors; but it must be remembered that the release of a bankrupt from any part of his obligations is now left to the voluntary action of his creditors, and there is nothing to prevent a small debtor from trying to arrange a composition with his creditors if they are willing to agree to it.

5. "That the frequency of the commitments to prison of the same debtors shows that imprisonment for debt is not always deterrent to the dishonest debtor, while it often inflicts unmerited punishment upon the honest debtor." These are two remarks which have no connexion with each other. The first might be appended as a marginal note to the whole body of judicial statistics. The same persons are continually imprisoned for theft; therefore the punishment is not always deterrent, and the Select Committee would, we suppose, on this ground propose that imprisonment for theft should be abolished. As to the second remark, it is a mere dogmatic assertion, and no evidence is adduced to prove it. Innocent persons will from time to time suffer under any law, but there is no reason to suppose that this "often" happens in the case of small debtors in the County Courts.

6. "That in many districts of England and Wales debts are contracted, and an undue and unnecessary amount of credit given, often without the knowledge of the principal debtor, and it is expedient such dealing and credit should be checked." This implies, we presume, that husbands should no longer be held responsible for debts contracted by their wives, and of course if this rule is to be laid down, it must be applied to all classes alike. It opens up, therefore, rather a wide question, on which the opinion of the public is, we suspect, scarcely so far advanced as that of the Committee, and which we need not argue just now. We agree with the Committee, however, that it is expedient that the dealings they mention should be checked; for that reason we think it is not desirable that the existing check should be removed. That check consists in the husband's knowledge that, if he allows his wife to contract debts beyond their means, he may find himself in prison, and in the wife's knowledge that her husband's liberty depends upon her discretion.

7. "That in giving the credit mentioned in the last resolution, the creditor to a great extent relies upon imprisonment for debt as a means whereby, in case of default, he will be entitled to recover the amount due to him." If he did not rely on this, he would of course have nothing else, in a vast number of cases, to rely upon; for small debtors usually belong to a shifty and wandering class, without fixed homes or any property which can be seized.

In the body of the Report the Committee summarise some of the arguments in favour of keeping the law as it is. It is remarked that, "according to our present habits and customs, credit is as much a necessity for the poor as it is to the rich"—we should have been disposed to say more a necessity to the poor than to the rich; to the rich man it is only a convenience, not a necessity; "that the poorer classes cannot get on without it; it is life and death to the million"; and that, "if imprisonment were abolished, it would tend to destroy much of that credit which is now indispensable to them, or to raise its price to their disadvantage, in order to meet the increased risk." It is admitted that "sometimes debtors refuse to pay, although they have the money in their pockets, until the law is actually put in force"; that, "if imprisonment were abolished, many an obstinate or dishonest debtor would contrive to evade the due discharge of his just obligations," and that "it is the apprehension of this imprisonment quite as much as the imprisonment itself which enables the creditor to enforce his rights." It is also pointed out that it is only in the event of the debtor refusing or neglecting to pay, when he either had or still has the means of paying, that the warrant is issued; and "that when such a fact is proved, there can be no hardship in sending him to prison." The Committee make no attempt to answer these arguments, and simply omit all reference to them in summing up their conclusions. To us they certainly appear unanswerable; and this would seem to be also the opinion of the County Court judges, the great majority of whom are in favour of maintaining the present law, on the ground that credit is absolutely necessary to the working classes, and that if imprisonment were abolished credit would be denied.

It is necessary to observe that the question at issue is really whether a contumacious debtor who has the means to pay a debt, and who refuses to pay it, should be punished, or whether he should be allowed to snap his fingers in the face of his creditors with impunity. Imprisonment for inability to pay debts has been abolished; but the Committee appear to have failed to grasp the dis-

inction between inability and unwillingness to pay. For example, they argue in one place that "the necessary result of imprisonment is to destroy for a time the principal means which the debtor has of satisfying his obligations"; but a debtor can be imprisoned only if he is proved to have means, and he has therefore merely his own perversity or dishonesty to thank if his occupation is interrupted by imprisonment. In consequence of this confusion between debtors who cannot and debtors who will not pay, a great deal of false sympathy has been expended on the small debtors who are sent to prison. A return which has just been issued shows that in 1872 there were 900,763 plaintiffs entered in the County Courts, and that more than half of these were for sums between 5s. and 40s. Seven thousand persons were imprisoned in this year, and here again more than half of them were imprisoned for default made in payments of from 5s. to 40s. It would be rash, however, to assume that these debtors, because their debts were small, were all poor people. It is notorious that a considerable proportion of the small debtors are simply genteel swindlers, who live in lodgings and go about from one neighbourhood to another taking advantage of shopkeepers. Nor are the members of the working classes who get into debt invariably deserving of compassion. Many of them are in receipt of good wages, which they prefer to spend in drink rather than in paying the retail dealers who supply their families with food. When a place at last becomes too hot for them, they simply move off elsewhere, and are lost in the great throng of nomadic population. It is impossible, however, to deny that hard cases occasionally occur. Tallymen prowl about the country, tempting the wives of labouring men with their pucks and their offers of unlimited credit; and there is also a certain class of small shopkeepers who try to get their customers into their power by enticing them into debt at the beginning of the connexion. It is unfortunate that the working classes should fall a prey to harpies of this kind, but it does not follow that the only remedy is to relieve them from all obligation to pay their debts. It seems to us more natural and desirable that they should be encouraged not to plunge into debt. It is impossible in such a case to imagine anything more mischievous than legislation which starts with the assumption that it is perfectly hopeless to expect men to exercise a little prudence and self-restraint. The friends of the working-man, who are anxious that he should be recognized as an infallible oracle of political wisdom, invariably depict him in his private capacity as an imbecile and grovelling fool. It is proposed that the sale of liquor should be suppressed as the only means of preventing him from getting drunk, and that credit must be made practically impossible in order to keep him out of debt. For our own part we should be disposed to place more confidence in the moral capacity of the working-man, and to trust more to his power of self-reliance and self-control. It may be true that the County Court judges are not quite so careful as they should be in ascertaining that debtors have the means to settle the claims against them; but this is a defect, not in the law, but only in the administration of it, and it is a defect which would seem to be capable of amendment. On the whole, any hardships which may be inflicted in this way must be very slight compared with those which would attend the withdrawal of credit, or the severe conditions which would be attached to it if creditors had to trust to their own ingenuity to bind their debtors. There is a lack of plausibility in the argument as to an inequality of the law in regard to remedies against debtors for large and small sums which disappears on closer examination. "The rich man," as Mr. Kerr puts it, "makes a clean sweep of it, and begins again, while the poor man has a miserable debt hanging around his neck all his life." The explanation is simply that large traders trust for protection rather to their own discrimination in giving credit than to the aid of the law in recovering debts, and do not think it worth while to pursue debtors very keenly, while small traders cannot afford to abandon their claims so easily. Besides, an estate of a few pounds would not bear the costs of administration. It will be observed, however, that the Committee do not suggest any means of white-washing small debtors, except releasing them from all obligation to pay their debts. They would thus be enabled to keep their money and to defy their creditors. Their goods would of course be liable to seizure, but there would probably be few cases in which any goods could be found. It seems to us that it would be more to the advantage of society that the working classes should be encouraged to discharge their debts than assisted to defraud their creditors.

GENTLEMAN EMIGRANTS.

A GENERAL order from the Horse Guards invites attention to the conditions under which officers of a certain standing may obtain land in some of our colonies. The colonies in question are Natal, British Columbia, and British Honduras; not the most attractive perhaps, as the *Times* has observed in a leader on the subject. But we should be inclined more particularly to call the attention of military gentlemen who may be contemplating a fresh start on another continent to a letter of Mr. Sprout's which appeared on the 15th instant in the same journal. Mr. Sprout is pretty well known as an enthusiastic advocate of emigration, and no man believes more entirely in the resources and the future of British Columbia. But his letter contains an emphatic and honest warning, which is not the less valuable because it is only the repetition of what is perpetually being in-

culcated by precept and experience, and which should be especially worth the laying to heart as coming from a man of his known opinions. He reminds people who are looking away from high prices and a hard existence in the old country to the chance of easier times elsewhere, that straitened means are no test of the qualifications of an emigrant, and that it is not every able-bodied gentleman who is made of the stuff for successful colonization. Mr. Sprout's letter will not have been written in vain if one of the gentlemen for whom it is intended should profit by its warnings. But in this particular matter we should be inclined to go further than he does. We should say that men of the class to whom the order from the Horse Guards is addressed are the very last who are likely to benefit by the colonial invitation; nor indeed is any gentleman in whom the habits of a crowded civilization begin to be confirmed in much better case.

According to popular ideas, the three colonies named in the circular are certainly not specially seductive. With Honduras we couple the notion of picturesque lagoons and magnificent forests, where mahogany and logwood trees and purple-wood and amboyna and all the timber that goes to inlay ornamental cabinet-work attain to dimensions as colossal as the alligators, mosquitoes, and centipedes. Natal has its triple climate and its zones of productive soil, and can grow anything, they say, from oats and turnips to sugar-canes and coffee. Still we are rather in the way of picturing it as a sandy land lying under a blazing sun, which offers considerable advantages to enterprising ostrich-farmers if they stop short of overstocking the markets. Of British Columbia we hear such contradictory accounts that we have come to regard it as the colonial puzzle of the day. Mr. Sprout, as we have said, believes in it thoroughly, and in the uncompromising Report of Major-General Moody of the Engineers we must admit that he produces a strong certificate to its character. The new Dominion seems to believe in it likewise, or it would not have made such a point of constructing the costly railway which is to link the old Ultima Thule of the Hudson Bay Territory to the rest of our North American possessions. But, on the other hand, we have fresh in our recollection the reports of unprejudiced travellers who have seen very little to admire in it, down to Mr. Grant's *Ocean to Ocean*, published the other day, in which he talks so doubtfully of its agricultural and pastoral prospects. Be all this as it may, and should the capabilities of these colonies have been as much exaggerated as their detractors say they have been, it will only strengthen the considerations we have to urge; while, should all the three be everything that Mr. Sprout avers British Columbia to be, his words of warning are the better deserving attention. There are exceptions to all rules; but we take it there can be little question that gentlemen colonists should be caught young, or should be fitted by their previous training for the new calling to which they betake themselves. Now most military men are very unlikely to fulfil the latter condition, while the order from the Horse Guards absolutely stipulates that they shall only partially fulfil the former. The officers who are to be eligible must have been of a certain length of service; not necessarily a very long one, it is true, yet still quite sufficient to go far to injure their chances. Naval men must have been sub-lieutenants; military men must have done duty for seven years, unless they have been on the Staff for five years, or in the medical service for a similar period. Further—and perhaps it is only fair in the circumstances—the older officers are tempted by the better offers. It is contemplated that veterans of twenty-five years standing may be induced to emigrate, and it is to these that the most liberal terms are tendered. They may receive as much as six hundred acres of land, if they have the money to pay for them at the reduced rate.

The gentleman emigrant, we say, should have been caught young, or he should have received some preliminary training. We should say precisely the same thing if overtures had been made to him from the most inviting colonies in Australasia or America. As a youth he may be exposed to all the snares that are set for the inexperience of "new chums." But at least he goes out full of hope and vigour; he may presume that he has a long day before him; he has little or nothing to unlearn; and if he be only content to wait and listen to good advice, the chances of succeeding should be all in his favour. As a matter of fact, we know how high even in these cases is the average of failures. It is not only the men who betake themselves to dissipated ways when they have broken away from their accustomed restraints that come to grief. Many a highly-educated youth of good previous position, and who started with fair means, is tending sheep, or driving bullock-drays, or loafing about tavern bars and billiard saloons, simply because, as Mr. Sprout says, he never had the stuff in him for a colonist. For him it is, at worst, a wasted life. He is not a husband or the father of a family. But conceive the position of an average captain of five-and-forty who ships himself with his wife and children for the back settlements of some half-reclaimed country. He was conscious of no special aptitudes for colonization, nor had he any previous acquaintance whatever with the geography, climate, or social conditions of the land he thinks of adopting. He hesitated long before he closed with the proposition made to him; and those half-dozen children of his were the arguments that finally decided him. He knew that things were very bad at home, and tending to worse, according to all appearances; but hope kept whispering the flattering tale that it was at least possible that he might better them. He embarks with none of the sanguine enthusiasm which carries one through difficulties more easily than anything else, and flavours toils and hardships with the fresh charm of novelty.

When he lands with his large family and his small means, he finds that he cannot support the charges of colonial hotels. So he has no time to pick and choose, or to stand hesitating between this lot and that, between this district and that other one which is still more highly favoured. He sees his lot traced out and coloured on paper, with its woods and meadows and water privileges, and he is content to accept the assurances of Crown agents who have never been on the spot, and to make the best of it. He sets his face up country straightway. His wife may have been in the habit of following the regimental movements, and may have been forced to put up with rude quarters in her time; but she never yet had actually travelled on a baggage-wagon. Now she makes the toilsome journey in a dray, and possibly at night may be reduced to camp in the open, where the night air sets the children coughing, even if it is not charged with the seeds of swamp fever. Wherever she was billeted before she had at least always a roof of her own over her head, even if it was only a hired and humble lodging. Now she may have to share the common living-room in the log-hut of some friendly stranger, while her husband is busying himself with constructing their dwelling. His own experience as architect or carpenter has been small. The use of an axe is utterly strange to him; hired labour is scarce, rough, and very expensive. We may imagine him to be housed at last, better or worse, in the middle of this property of virgin meadow and forest—six hundred, five hundred, four hundred acres having been assigned in the inverse ratio of his physical ability to deal with them. If he intends to make his fortune by agriculture, he has to drain the meadow and clear the forest. If he means to cut dyewood for the European market, he must betake himself forthwith to a regular woodman's life; and if he means to speculate in ostrich-farming, he has to prepare his gigantic poultry coops, patent hatching-apparatus, and long lines of park palisades. Perhaps half a score of years ago, before he married, he used to be rather the fine gentleman of the regiment. No doubt he would have gone through the hardships and dangers of a campaign with spirit, for the sake of the honour and glory. He was in the way of taking a good deal of exercise round garrison billiard tables, and was indefatigable on the fields and in the covers when a friend gave him a day's shooting. But exertion for the sake of the exertion was never at all in his way. Yet now, if he means that his little place shall support him, he must be indefatigable in his exertions from morning to night. He must toil like a horse himself, and devote unremitting attention to superintending the men who are working under him at wages that are swallowing up his little capital. They are all more experienced than he, and despise him for his ignorance and awkwardness, and he must accept responsibilities for matters of which he knows nothing. Few men would be equal to supporting a strain so severe and so sustained, both physical and mental. For the retired officers who go out on these terms must almost invariably have staked their little all on the venture, and failure must mean their irremediable ruin. Even assuming that everything turns out in their favour, that the land is good and the situation salubrious, that there are easy communications with markets, abundance of water, helpful neighbours, and all the rest of it, still we can hardly conceive how any gentleman encumbered with a family can hope to pick up a decent competence on five hundred acres of un reclaimed country. But to assume that every circumstance is in his favour is to count upon an extravagant coincidence of improbabilities; the odds are that the property falls far short of its promise, and that the rough continues to predominate over the smooth. The value of the produce may be swallowed up in the cost of transport. The water springs may run short in the annual dry season. The rain may lay the whole under water. The advantages of water carriage may be counterbalanced by the epidemics that are bred in low grounds by rivers under a warm sun. We do not count the calamities which scourge a whole colony, and may befall the most experienced—as floods, and droughts, and diseases among the cattle, to say nothing of perils from savages.

We have drawn, it may be said, an extravagantly gloomy picture; yet it would not be difficult with but a slight exercise of imagination to add to the catalogue of perils and hardships that await the gentleman emigrant of mature years. A new settler's life is necessarily a hard one at first; and his future is always precarious, especially if he begins in a humble way. What we argue is that "officers and gentlemen" must enter very heavily handicapped for a race where many are always breaking down. At least they should weigh every untoward contingency carefully before they stake their small means on success in a new profession, and one that is altogether foreign to their former experiences. It is doubtful whether even modest comfort is likely to be attained on lots so limited as those which are offered, and it seems scarcely prudent to venture on a speculation where there is ruin on the one side and only a competence at best on the other.

ARCHBISHOP MANNING'S PASTORAL.

THE Pastoral of "the Archbishops and Bishops of the Province of Westminster, in Provincial Council assembled," bears throughout the unmistakable impress of the mind and style of its author. As Dr. Manning's recent letter to the titular Primate was a psalm over the happy condition of Roman Catholic Ireland, the Pastoral is an exultant psalm over Romanism in England. It begins with telling us that the chief reason why no Synod has met for

fourteen years is to be found in "the completeness of the decrees of the three Provincial Councils already held"; the first of which fixed the order and discipline of "the rising Church which, by the act of the Sovereign Pontiff, had come forth from its scattering and captivity," the second its temporal administration, and the third its ecclesiastical seminaries. And they did their work so thoroughly as to leave nothing to be desired. In this Utopian state of the Church, where there are no abuses or disorders, nothing to reform or correct, it may be asked why the present Synod was held; and the more so, Dr. Manning might have added, as the usual rule has been, not to hold Provincial Councils while a General Council is sitting, and the Vatican Council is in theory suspended, not dissolved. His replies that the canons prescribe triennial Synods, except when the obligation is dispensed with by the Pope, though he does not add that there are very few countries beyond the limits of the British Empire where this "obligation" is allowed by the Government to be acted upon. The Synod of Ware has met accordingly, "not to reform or correct, but to unfold and expand, our former legislation," in view of the enormous growth of the Church in England during the last fourteen years, on which the Archbishop enlarges with eloquent enthusiasm. For three centuries English Catholics were governed by a few Vicars-Apostolic, whose jurisdiction reached from sea to sea, while their missions were scattered at distances of a day's journey from one another. Now there are thirteen dioceses, and a whole organization of churches, colleges, and schools, which has almost doubled during the last fourteen years; so that the whole face of England, especially in our large cities, "begins to put on the aspect of Catholic lands," old prejudices and suspicions "are gone to the moles and to the bats," and "there is spread over the face of England a benevolence towards the Catholic Church and the faith of our ancestors such as for three hundred years has never been." In this happy period of Paradisiac perfection the Synod of Ware has sat for three weeks—as the Archbishop puts it, with a covert sting at another communion which he seldom misses an opportunity of contrasting with his own—"in the perfect unity of faith and charity, of heart and mind, of will and purpose, which is the heirloom of those alone who inherit from the Apostles." The result of its deliberations cannot indeed be made known till its decrees have been approved by the Holy See; and that may involve many months, perhaps a twelvemonth's delay, for Rome is apt to be slow in her movements. A paragraph has gone the round of the papers to the effect that one decree is to order the secular clergy always to appear in public in cassock and tonsure, which would certainly be as conspicuous a way of flaring the red flag in John Bull's face as the most ardent convert could desire. For the present, however, it is enough for us to know, on the highest authority, that "the Catholic Church from this Synod will have gained an incalculable increase in its solid unity and in its vigour of action throughout the whole of England." Perfect as it was before, it will have become more perfect still.

But, after all, it may be presumed that the thirteen Bishops, two mitred Abbots, Chapters, Provincials, and Heads of Orders, theologians and officers of the Council, here enumerated, did not meet together for twenty-two days simply as a Mutual Admiration Society, to exchange compliments and congratulations. And accordingly, after a long and jubilant preface, the Pastoral comes to business. First, there is a warning to the faithful—which, notwithstanding their "noble and inflexible fidelity" may not be at all superfluous—against the sceptical atmosphere of this nineteenth century, when, "from the highest to the lowest class, unbelief has its literature and its apostles." And this brings the Archbishop, by an easy transition, to the first of what are in fact the two leading topics of the address. He passes lightly over the question of primary education, where he naturally takes the same line as the great body of the Anglican clergy, as an uncompromising advocate of the Denominational system. On that matter there is not likely to be any difference of opinion among his flock, and the course of action is clear enough. But the point he is really anxious to dwell upon is the "higher" or University "education required by our youth from the age of seventeen or eighteen to twenty-one or twenty-two years." The growth of "a numerous middle class," chiefly through the accession of educated converts, has made this a very pressing question for English Roman Catholics; and it would be pretty clear from the tone of the Pastoral, even if it were not well known already, that these "educated families" are by no means willing to acquiesce in the exclusion of their sons from the education of the national Universities. Some ten years ago they sent a deputation to Rome, requesting permission to avail themselves of the new opening for Catholic students at Oxford and Cambridge, and received a rather ambiguous reply. But of Dr. Manning's policy on the subject, both before and since he became Archbishop, there has never been any doubt. Twice over Dr. Newman has bought ground at Oxford, with the view of building a church there for the benefit of Roman Catholic undergraduates, and twice over he has been compelled to abandon the scheme under pressure from the authorities of his own Church. The Jesuits, whose view does not seem quite to accord with Dr. Manning's, and who are apt to get their own way, have now succeeded in doing what Dr. Newman was not permitted to carry out. Meanwhile the Archbishop reminds the faithful that five years ago he felt it his duty to warn all parents that they could not send their sons to Oxford or Cambridge without peril of losing faith or morals, or both, and he is now "compelled to repeat this admonition with still graver warning." He has also obtained a more stringent "declaration" from Rome on the sub-

ject, though it is evidently thought prudent, in view of the partial and reluctant compliance accorded to former admonitions, not to issue any positive command. A hint is thrown out that some day a Catholic University may be founded in England by "those who come after us," but the readers of the Pastoral can hardly help feeling that this is a very broken reed to lean upon. Some twenty years ago the attempt was made, under exceptionally favourable circumstances, in a country where four-fifths of the population are Catholic, and with Dr. Newman's splendid services placed at its disposal, to found such an institution for Ireland. But it proved so complete and ludicrous a failure that, except in a respectable medical school at Dublin, scarcely a trace of it remains, and he must indeed be sanguine who expects that in England, with a mere fraction of the population Roman Catholic, and without Dr. Newman's genius to rely upon, the result would be more satisfactory. As to the perils to faith and morals of which Dr. Manning speaks, it might be sufficient to appeal to his own former experience, while it is not irrelevant to observe that this very Pastoral bears unmistakable evidence on every page of that culture which he is so resolutely bent on interdicting to the youthful members of his adopted Church. He owes it to his Oxford training that, whenever he chooses to address his countrymen, he can command a hearing, though he may not win assent; and if his public utterances are compared with those of even the ablest of his suffragans, such as Bishop Ullathorne, it is impossible not to feel at once that you are descending to a totally different level, or, as Mr. Matthew Arnold would express it, passing from culture to barbarism. It is not wonderful, then, that educated Catholics, especially converts, should wince under restrictions arbitrarily imposed, which place their sons at a distinct disadvantage, socially and intellectually, with their Protestant fellow-countrymen. The Archbishop must know that very many of them share the opinion expressed the other day in the *Times* by one of the most distinguished and most unimpeachably orthodox of their number, Mr. F. A. Paley, that "no greater mistake in relation to higher Catholic education could have been made." And Mr. Paley's experience of Cambridge, ranging as it does through a period of forty years down to the present day, gives great weight to his testimony as to the question of fact. Scepticism in the present day is of course to be met with everywhere, and cannot be suppressed by ignoring its existence; but we believe all evidence bears him out in saying that "it is not true that there is more of lax morality or of scepticism at these Universities" (Oxford and Cambridge) "than in society generally, or than, at least, there is said to be in Catholic Universities on the Continent." We have heard a Roman Catholic who had passed successively through Oxford and Louvain—the one episcopal and exclusively Catholic University of Belgium, if not of the Continent generally—maintain the superiority of Oxford in both respects.

But, in fact, Universities, which were originally a creation of mediæval Catholicism, have been looked on with deep suspicion by the Roman Church ever since the Council of Trent. It was then that the separate seminary system for the clergy was organized, which Dr. Manning is so anxious to see universally spread over England, though he appears, rather inconsistently, willing to drop the *petit séminaire* out of the scheme. The Jesuits for a time contrived to possess themselves of a large number of Universities, and at the beginning of the eighteenth century they are said to have held in their own hands the Theological and Philosophical Faculties of about eighty. But since their own exclusion from these posts they have not been slow to denounce the whole system of modern Universities, which their Roman organ, the *Civiltà Cattolica*, politely designates "not only dry, but dry and stinking bones, so great is the stench that rises from their deadly and pestilential teaching." As to the present point Dr. Manning should remember that, if the little handful of Roman Catholics who now resort to Oxford and Cambridge find any special danger to their faith and morals, he has himself very much to thank for it. If they were reinforced by the general body of their co-religionists of the class from which the Universities are chiefly recruited, it would be hard if they could not hold their own.

The later part of the Pastoral is occupied with a topic on which we commented some months ago, when a rather angry correspondence about it was going on in the *Times*. Archbishop Manning insists that mixed marriages without dispensations are unlawful, though he allows them to be valid, and that dispensations can only be granted on condition of a promise that all the children shall be brought up in the Catholic faith, and that the marriage shall be solemnized in a Catholic church alone. And he argues that these two conditions have always been obligatory, under pain of sin. They certainly have not always been enforced. An arrangement by which the children were to be trained in the faith of their parent of the same sex was at one time very common in England, and is still, we believe, common in Germany. And as to the prohibition to repeat the nuptial ceremony in an Anglican church, which is condemned as "an act intrinsically sinful," no one knows better than Dr. Manning that it was first introduced a few years ago into England by himself. The change in the English law by which "the registrar took the place of the Protestant clergyman" dates, as he himself points out, from 1836, but the "sinful" custom of repeating the marriage ceremony went on, with the full acquiescence, if not the open sanction, of bishops and priests, including his own predecessor Cardinal Wiseman, till he himself became Archbishop eight years ago. We cannot say that it ever appeared to us a matter of at all the importance which some indignant Protestants have attributed to it. A disciple of Dr.

Cumming's would probably think twice before marrying a Roman Catholic, but any one sufficiently sympathetic or sufficiently indifferent to be ready to form a lifelong union with a member of that Church can hardly be credited with any very profound conscientious objection to cementing the union by an exclusively Roman Catholic ceremony; and we believe that the marriage rite of the two Churches is in fact very much the same. Still the prohibition, like that of mixed marriages altogether, is an arbitrary one, and we must add that, in pointing to the practice of his Church in creating all sorts of impediments, over and above those held to be of divine obligation, which make marriage without dispensation unlawful or invalid, the Archbishop has challenged attention to a very vulnerable peculiarity of its discipline. In this very case, as we had occasion to show the other day, the Brazilian bishops have used or abused the rule to treat Protestant marriages as intrinsically invalid, and therefore annulled in practice by the subsequent conversion of either party to the Church. Thus, again, not only is the marriage of first cousins prohibited, about which no doubt a good deal may be said, but of second or third, if not even more distant, cousins also; while yet in some countries dispensations for the marriage of uncle and niece are given as easily as asked for. It is difficult to see any object in these manifold and often whimsical impediments—all of which are dispensable "for sufficient cause," and are in practice habitually dispensed—except greed of power or of gain. In former days enormous sums were paid into the Roman Chancery for dispensations, and it appeared from a discussion in the Vatican Council that the practice is not yet extinct. But the restriction is probably retained at the present day chiefly for the hold over, the bait which it secures to the ecclesiastical authorities, who can apply the screw with tyrannical force, as in this case of mixed marriages, when it so pleases them. We have heard a zealous convert express his approval of these unions "as a means of spreading the faith"; and when the Catholic partner is in earnest and the Protestant ignorant or indifferent, such a result is not unlikely to follow. Dr. Manning is evidently not desirous of encouraging such alliances, but he is resolved to secure the lion's share for his own communion when they do occur. That they are increasing, and likely to continue to increase, in this country as elsewhere, as Roman Catholics and Protestants get thrown more closely together, there can be no doubt. And, considering the evil consequences of intermarriage in all close corporations, of which the English Roman Catholic aristocracy has supplied one out of many illustrations, there is little reason to regret it. But it remains to be seen whether in this matter, or still more in the matter of University education, the "dearly beloved children in Christ" to whom the Pastoral is addressed will be willing to submit to all the restrictions which their bishops are desirous of imposing on them.

THE GAME-LAWS IN SCOTLAND.

THE dissatisfaction of Scottish farmers at the Game-laws was expressed with more force than reason before the Committee of last Session. Some of the complaints which they alleged were shown to be destitute of foundation, and they were driven at last to rely on the "food of the people" argument, which may be pushed to an inconvenient point. It cannot be too clearly stated that "the depopulation of the Highlands" is due, not to deer and grouse, but to sheep. The farmer really caused the evil which has been partially remedied by the sportsman. In that happy time before Scotland's woes began, a certain estate turned out seven or eight hundred fighting men in the Rebellion, and consequently the population could not have been under five or six thousand. When the depopulation began, in 1780, that estate fetched 700*l.* or 800*l.* a year. The people were then cleared off to make way for sheep. That estate has now a population under two thousand, and the rent has risen from 800*l.* to 10,000*l.* or 12,000*l.* "This," says a witness who states these facts, "is the result of sheep and game together." Formerly all those hills which are now held by sheep were occupied by cattle, but they brought in less rent, and sheep-farming was found to be more profitable. As sheep-farming was introduced into the country the small crofters disappeared, because they had no longer a place to graze their cattle in the summer, and all their crofts and little harvest-fields were wanted for grass for sheep in winter; "and that was the cause of what is commonly called the depopulation of the Highlands." It must be remembered that the large sheep-farmers do not in general reside in the Highlands, whereas the owner or tenant of a deer forest is not likely to be absent from it in the shooting season. The modern passion for Highland scenery and sports causes wealthy men to purchase or rent Scotch moors and forests, and the adverse witnesses strive ineffectually to deny that the country has benefited by becoming the recreation ground of a rich and liberal class. It cannot, however, be questioned that, if all the deer of the Highlands were displaced by sheep, the supply of animal food for the United Kingdom would be increased in a minute proportion; but if once you start on the utilitarian principle it is difficult to stop. One of the most earnest opponents of deer forests on the Committee was Mr. McCombie, M.P. for West Aberdeenshire. This well-known grazier and cattle-dealer pressed the "food of the people" argument to the utmost, yet he appeared before another Committee of the same Session to urge the importance of encouraging the breeding of prize oxen, which he at the same time admitted

do not pay their cost. Venison and Christmas beef are equally indefensible in the view of strict economy, but we venture to think that, if luxuries are to be tolerated, the shapely, graceful stag has a better title to exist than the gross, unwieldy bullock. We can at any rate discover the stag's beauty for ourselves, while we require Mr. McCombie to instruct us in the merit of the prize ox. In his opinion that merit is so great that private slaughter-houses, which some people think are nuisances, ought to be maintained in the West of London, in order to encourage the farmers of Aberdeenshire to overfeed their cattle. This question of abolishing private slaughter-houses was, in Mr. McCombie's view, a very serious question. It not only affected the consumers and the retail butchers, but it deeply affected the graziers and the landlords of the North of Scotland. If cattle cannot be brought alive to London, "emulation among graziers and butchers will be at an end." It seldom or never pays directly the grazier or the butcher to feed or to purchase prize animals, but both may gain by it indirectly; the grazier by his brand, the butcher by gaining *éclat* for his shop. "The grazier takes a pride in producing, and the butcher takes a pride in exhibiting, these fine animals." Persons who are deficient in sense of beauty and power of imagination, and who object to smells which they think unpleasant, have proposed that the cattle bred by Mr. McCombie and others in Aberdeenshire should be killed there and brought to London in carcase. But what is a peach without its bloom? Mr. McCombie wishes private slaughter-houses to be maintained in London in order to induce butchers to buy cattle "at prices beyond their intrinsic value as meat"; yet this same Mr. McCombie pressed on landlords and sportsmen who appeared as witnesses before the Committee on the Game-laws the argument that "the food of the people" would be increased by substituting sheep for deer. It is fairly stated in the Report of the Committee that the complaints against deer forests have for the most part come from sheep-farmers who have keenly felt the competition of sportsmen for mountain grazing. A witness whose "duty to his brother and his Maker" forbade him to maintain a Game-law was doubtless not insensible to the consideration that, if there were no game, there would be no shooting tenants and keepers to vex the farmer's soul. The Committee found that the number of sheep actually displaced by deer, taking the highest estimate, could not exceed 400,000, and only one-fourth of this number—namely, 100,000—could be brought to market each year; and as these sheep had for the most part to be wintered away from the mountains, not much more than half the weight of mutton supplied by them could really be credited to the grazing ground now devoted to deer. Thus we may safely put the sheep displaced by deer at 56,000, whereas the number of sheep in Great Britain in 1871 was upwards of 28,000,000; and supposing one-fourth of this number, or 7,000,000, to come to market yearly, the loss would not exceed $\frac{1}{4}$ part of the total quantity. It must be remembered too that venison is eaten, although not generally sold, and this calculation takes no account of imported mutton. It may be added that in England the proportion of sheep coming to market yearly would greatly exceed one-fourth.

Many curious features of character and habits of thinking are exhibited in the course of a Parliamentary inquiry into such a subject as the Game-laws. Deer is not, properly speaking, game, although it enjoys the same protection as hares and pheasants under recent legislation. It was difficult to get some of the Highland witnesses to understand the question which is so important in England as to restraining trespassers in case the Game-laws should be abolished. In many districts there is no poaching or possibility of poaching, because there is nobody near enough to the forest who is not in the landowner's employ. A farmer who zealously denounced the Game-laws was asked how he would check trespassers without them. He was asked what he would do if five strangers came to shoot upon his land, and he answered that he would take ten of his own men and put them off. He afterwards endeavoured to qualify this incautious answer, but it remains on the Committee's notes. Some farmers who complain bitterly of game admit that their objection would be mitigated if it were let to themselves along with the land, instead of being let separately to shooting tenants. Many grievances have been magnified by want of tact on one side and of temper on the other; and in at least one case which was sifted by the Committee, it appeared that the tenant had got his farm cheap because of the game, which at the same time enabled him to enjoy the luxury of perpetually grumbling. It would need strong evidence to convince us that in any considerable number of cases the Scotch farmer loses heavily by game, or could be deterred by fear of his landlord from publishing his grievance, if he had one. It did, however, appear that martyrs rather shrunk from cross-examination by the Committee. The cases of alleged clearance were generally answered by the landlords in person, and it appeared that the witnesses had truly stated that old cottages had been pulled down, but they had forgotten to add that new cottages had been built, either on the same sites or close at hand. In one case where a sheep farm had been lately turned into a deer forest, the reason was that, at the present high price of sheep, it was difficult to find a tenant who would take the existing stock at a valuation. Consumers who are groaning at the high price of mutton may perhaps derive comfort from learning that cautious Scotch farmers are looking to the possibility of reduction; but we must say that we think these farmers rival in farsightedness a witness who believes that there is a limit to wealth and luxury, and that the demand for deer forests and grouse moors may be ex-

pected to abate. The rise in rent of Highland properties during the last thirty years is marvellous, and whatever may be the effect on national wealth, there is no doubt that deer pay the owner who lets his land better than sheep. In fact the Highlands of Scotland have become to a select class of wealthy Englishmen what Switzerland is to Englishmen generally, a playground. There is at this moment, indeed, a prominent difference between the two countries—that you can travel to Switzerland more safely than to Scotland.

Although the complaints brought before the Committee were shown to be exaggerated, it is undeniable that a strong and not altogether unreasonable feeling exists in Scotland against the preservation of game. The Committee notice "the excessive preservation of ground game on certain large estates in Scotland" as a legitimate source of dissatisfaction, and both in England and Scotland it is the hares and rabbits which not only do actual mischief, but cause perpetual disputes. As regards deer there is little urged against them except that they displace sheep, and as regards grouse it is clear that, if the farmer had the letting of the shooting, he would be tolerably satisfied. This appears from the evidence of Mr. T. Purves, who dislikes sportsmen in general so much that he actually complains of their occupying the inns and excluding tourists "who pay the innkeepers much better." If a tourist pays better than a sportsman, it can only be because he does not know the country so well and is more easily imposed upon. But Mr. Purves, while expressing strong opinions against game and Game-laws in general, admitted that he rented both farm and game, and let the latter to a sporting tenant. He was asked whether he would object to deer coming on his sheep farm, and he answered that as a tenant farmer he would not, but in the public interest he would. He belongs to a class whose talent for indirect answers has become proverbial, but he was persuaded to admit that the shooting on his farm would be more valuable if there was a chance of getting a stag from the neighbouring forest now and then. The truth is that deer and grouse shooting has become so valuable that, if a landowner were compelled to choose between his game rent and his farm rent, he would be apt to prefer the former. Some of the farmers say that they would be glad to see their landlords and landlords' friends, but they object to strangers who rent shootings, and still more to the gamekeepers whom these strangers employ. The strength of this feeling is shown by the absurdity of some of the complaints which they bring against shooting tenants. One farmer is shocked at an attempt to "bribe" his shepherd with a pound of tobacco, and another pretends that his sheep are so distracted by the sportsman's dogs that they cannot get fat. No doubt if the sportsman rented not from the landowner, but from the farmer, the sheep, which is an intelligent animal, would perceive the difference. It is said that this dissatisfaction of farmers at the Game-laws will strongly influence the Scotch elections, and it would appear that the farmers are not likely to obtain from the landowners what alone would content them—namely, the sacrifice of half their incomes. The excessive preservation of ground game is, no doubt, a clear abuse of the Game-laws which can easily be remedied. But we do not think that it would be safe to adopt the proposal often made to take hares and rabbits out of the game list. The Chief Constable of Dumfriesshire says that, if this were done, "all and sundry would feel themselves entitled to go and take the hares and rabbits as long as they lasted," and, beginning with hares and rabbits, they certainly will not stop there; and in his own county the number of police will require to be doubled. The Committee express the opinion that rabbits should be looked upon as vermin upon cultivated land, where they consume or destroy more food than they are worth, and they recommend that the protection given to rabbits by the Game-laws should be withdrawn, except in warrens or similar enclosed places. The opinion of the Committee is more clearly right than their recommendation. It may be feared that, as there is always a possibility of rabbits on a farm, there will be a pretext for "all and sundry" to come upon it; and perhaps a Scotch farmer who on principle objects to game, and in practice dislikes trespassers, seeing five men looking like poachers on his farm, will take ten men of his own and move them off; and then perhaps there may be work for the police.

ART AT THE VIENNA EXHIBITION.

v.

IF all, or even one-half, of the architectural projects now exhibited in Vienna were carried out, the face of Europe might be scarcely recognized by its oldest inhabitant. Still, though architects are proverbial for building castles upon paper, in the present instance they are able to show a large amount of good work either in progress or actually completed. The principal cities in Europe, as all travellers can testify, have within living memory been greatly changed for better or for worse. Happy are towns such as Nuremberg or Ravenna, which can manage to get on without restoration or enlargement. But such are the supposed exigencies of modern civilization, so considerable too is the increase of commerce and population, that there are comparatively few spots where the picturesque forms of old Germany and France, or the lovely types of mediæval Italy, are not marred by modern intrusions. How to put a new piece on an old garment is the problem which architects are perpetually striving to solve. In some places they are not able to do much harm; for example, in Berlin, Munich, Vienna, and Pesth, there has been little to spoil;

and yet in cities wherein modern builders have found wide space to work their best or their worst, as the case may be, it almost invariably happens that the points of especial interest are centred in some relic of the past not yet swept away. Hence in the Vienna Galleries the most pleasing and instructive drawings do not concern new structures, but old remains, such as the series of "Historic Monuments in France." It is, however, vain to lament over ruthless destruction or incongruous renovation which it is now too late to avert; the part of wisdom seems to be to make the best of things as they are. Such indeed appears to be the spirit in which the architects who find a place in the Vienna Exhibition have gone to work. The designs which we shall pass under review are for the most part commended by utility and fitness; decoration grows out of construction; and thus simplicity and unity take the place of that extravagance and empty show which have long been the bane of the architecture of modern Europe. It will hence be inferred that matters are improving. In fact, on the Continent we may trace changes analogous to the movements which in England have wrought a revolution. We say analogous, and not identical, for Continental Europe has been fortunately saved from the Itskinito vagaries which disfigure especially the provincial towns of England.

Few cities have had so fine an opportunity for architectural development as Vienna. The open space formerly occupied by the ramparts and glacis now forms the circuit of the Ringstrasse, two miles long, and in parts seventy feet broad. Here already stand the Opera House, the Franz-Joseph Kaserne, the Kursaal, and the Votiv-Kirche; to these will be added within the next few years the new Rathhaus, the University, and the Museum. The new Arsenal, which lies beyond the Belvedere Gallery, also calls for emphatic mention. These several buildings, which, when completed, with all their accessory squares, terraces, and promenades, will make Vienna the most stately capital in Europe, admit in point of art of distinctive classification. First in order of time, though not foremost in architectural merit, are the buildings which in style belong more or less to the usual routine of the Italian Renaissance. And yet one characteristic of Vienna is that even the most worn-out of styles are treated with originality, and thus such buildings as the Kursaal and the Opera House compare favourably with the more servile revivals in Munich. The Viennese are distinguished by vigour and versatility, and even when they are ambitious of ostentation, they manage to introduce novel or bold features which redeem compositions from commonplace. The large hotels, however, of which the elevations, &c., are shown in the Exhibition, do not rise above that insensate pomp and show which all the world over are supposed to favour trading establishments.

We have next to speak of certain noteworthy manifestations of brick architecture, large in scale, simple, broad, and independent in treatment. A member of the House of Commons at the time of "the Battle of the Styles," declared that "we live in an age of compromise," and it is the misfortune of Germany that she also has not yet passed into a more honest mode of construction. From the borders of the North Sea and of the Baltic down to the banks of the Danube—partly on account of the scarcity of good building stone—ordinary dwellings, and even the façades of public institutions, wear the dissembling disguise of plaster. In some few towns, however, especially in Hanover and in Vienna, there have sprung up of late years public and private buildings which in structure and ornament rely solely on brick. In the town of Hanover the designs are little more than tasteful adaptations from the brick architecture of Lombardy; but in Vienna, as her habit is, a more independent course has been taken. To her praise be it spoken, these edifices in baked clay are primarily utilitarian. The large stately barracks of Franz-Joseph have evidently been reared on strictly economic principles; and yet, by means of a salient sky outline, of bold cornices, and of corner stone-dressings, the art result is better than if thrice the money had been squandered. The great arsenal on the opposite side of the city, containing an armoury and decorated with frescoes, is naturally more ambitious than a caserma. With the best possible effect moulded brick is here used decoratively, and the principal tower and portal are set off with stone-work and statues. The style serves to substantiate the claim we have made for Viennese independence; the Saracenic is worked freely into the Norman; round arches enclose geometric tracery. It is interesting to observe how, as we approach the Eastern confines of Europe, architecture throws off its Western garb; thus on the banks of the Danube at Pesth is an imposing Kursaal, the arches round and boldly shadowed, the tracery geometric, the columns or pilasters fluted and relieved by figures. At Czernowitz, too, abutting on the Russian frontier, we learn through a series of drawings in the Exhibition of "the residence of a Grecian-Oriental bishop," apparently brick in structure, and showing decisive traces of the Saracenic style in the treatment of the rounded arch. We have already dwelt on the Orientalism which has found its way into the pictorial arts of Austria, and we now discover like affinities in the architecture.

But this sketch of architectural phases would be incomplete did we not call special attention to recent manifestations of Gothic within the Austrian capital. The Exhibition gives fitting prominence to "the Votive Church," the design of the Viennese architect, Ritter von Ferstel, raised by the present Emperor to commemorate his deliverance from impending death. The style is appropriately akin to that of the great parent cathedral; the two spires at the west end appear in the city panorama as the younger sisters of the lofty and symmetric spire of St. Stephen. But the composition is sufficiently

Independent; the side chapels nestle among the buttresses, the large windows of the clerestory and of the transepts make the interior light and lantern-like; the whole structure has symmetry and unity, as if the birth of one bright and happy thought. The church is emphatically beautiful, and thus it lacks the ruggedness and the picturesqueness which belong to the opposite readings of Gothic. Of like balanced proportion and delicacy in well-placed ornament is the Gothic Rathhaus by Herr Schmidt. A model with ground plans in the Exhibition shows a façade in three successive planes; foremost stands a spire, the base of which serves for a porch; next follows the centre, supported on arcading two arches deep, casting strong shadow; above rise clustered windows with a turret between each group—a most effective composition. The uppermost story is an arcading of small windows. The wings on either side retire a little back, the style becomes more quiet, and the light and shade less strong. The danger no doubt is that, as in the sister art of painting, so here, in the latest phase of Gothic architecture, the compilation is so careful, the system so studiously scientific, that bold creation finds no room. These pretty manifestations of Gothic have the fascination, especially for the amateur, of the Church of St. Ouen, but antiquaries and thorough artists take more delight in the west front of the Cathedral of Rouen—a structure said to embody an epitome of the middle ages. Even in such contrast will the Votive Church and the Rathhaus stand to the venerable Cathedral of St. Stephen.

Germany is composed of so many States that she can well afford scope for many styles. Berlin has long laboured under the misfortune of having been committed to a stately classicism which precludes variety or expansion; still the dignity of which the arts were in danger of dying at length yields to modern requirements, and luxury has softened down severity. In Dresden and in Stuttgart the Renaissance has obtained special developments, and the revival before noticed of brick architecture in Hanover has extended over Northern Germany, and may be traced as far even as Copenhagen. In Munich, as we all know, various historic and mongrel styles stand side by side, the last novelty being a new Gothic Rathhaus. With the exception of the Town Hall in Vienna and this design for Munich, Gothic is in Germany almost solely reserved for ecclesiastical structures; the style, however, is said to obtain warm supporters in the Rhenish provinces of Prussia. Speaking generally, we observe in Germany an awakened desire for decoration; new materials are eagerly sought which can be turned to ornamental ends, either in the way of colour or for surface ornament. We may also note a freer treatment of prescriptive styles, an adaptation of old forms to new exigencies, not only for the sake of utility, but in order to please the eye with polychrome and to bring the manifold forms of nature into the service of architecture. Again we find these movements on the Continent analogous to, though by no means identical with, well-known developments in England.

Unfortunately England exhibits so little in Vienna that the progress she has avowedly made can scarcely be appreciated. The only exhibitors are Mr. Blashill, who displays "Warehouses, Ludgate Hill"; Mr. Seddon, who again exhibits "University of Wales, Aberystwith"; Mr. Street, R.A., who sends designs for "the New Law Courts"; and Mr. Waterhouse, who displays "the Plan and Elevation of Eaton Hall, Cheshire." Under the important group "Art applied to Religion" there are but two entries, the first being a "Stained Glass Window for a Staircase, Watteau Style." In what relation a "staircase" and the "Watteau style" stand to "religion" the Royal Commissioners do not explain. It might have been almost better not to have exhibited at all than to do such cruel injustice to the best talent of England. But the authorities of South Kensington deserve well of their country for the kind care they have taken of women and children. Not only do they display designs of fans by female students, but they reserve a special department for the "Exhibition of all the Arrangements and Contrivances for the better Nursing, Training, and Rearing of Children; their Physical and Mental Development from the First Days of their Life up to their School-time; their Nourishment, Cradles, Nurseries, &c." Evidently important problems are here presented. Given the "cradles" and the "nurseries," the next question that arises is, what style of art best suits the "Kindergarten"? The answer here suggested is, the style taught in the schools of South Kensington. Such, in brief, is the moral enforced by the "British Section," and that at the sacrifice of architecture and much besides.

Russia and other countries, by virtue of a better organization, put England to shame. The architectural developments in St. Petersburg, Moscow, Tiflis, and other Russian towns, notwithstanding a too considerable percentage of bastard Italian designs, naturally present features unfamiliar to Western Europe. The church in Helsingfors, and neighbouring buildings in this the new capital of Finland, are little better than scenic displays of that Italian Renaissance which Russia is prone to plant upon whatever spot she places her foot. But the large and recently constructed Cathedral of the Saviour at Moscow, and more especially designs for a church at Tiflis, have better claims to nationality. The last is allied to the style which perhaps may be designated Norman-Saracenic—a combination to which, as we have seen, the Eastern provinces of Austria are tending. The form, as usual in Russia, is that of the Greek cross, and up in the sky is a parade of clustered domes; the colour and enrichments are almost Oriental. Russia possesses a rare opportunity of forming a national architecture based on the old Byzantine and borrowing colour from the East. The designs here produced serve still further to enforce the

law everywhere illustrated in these galleries, that the nations of Europe do most wisely when they fashion the architecture of the present on the historic examples which belong to their respective races and countries.

RACING AT DONCASTER.

IF, during a highly successful week, there was in any branch of sport a perceptible falling off from the standard of former years at Doncaster, it was in the two-year-old racing. At present singularly few first-class two-year-olds have run this year; indeed, when we have mentioned *Écosais* and *Marsworth*, we are at a loss what to add to the pair, and it is probable that we shall have to wait till the Middle Park Plate before we can form an idea of the comparative strength or weakness of this season's horses of that age. Usually the Champagne Stakes at Doncaster is one of the most important of two-year-old races, and it has almost become a proverb that a horse which has won the Champagne is sure to distinguish himself afterwards. It has of late years been carried off by such distinguished animals as *The Marquis*, *Lord Clifden*, *Achievement*, *Sunshine*, and *Cromorne*; while, as we all remember, *Blue Gown* came in first for it, despite the large amount of undeclared overweight with which he was burdened—an amount that has never been exactly ascertained. On the other hand, it has been occasionally won by second-class animals like *Zambesi* and *Walloon*, and an ordinary performer like *Redan* was able to make a dead heat for it with *Lord Lyon*. We suspect that this year it fell to a horse not above mediocrity, though the field was far larger than the average, no fewer than a dozen coming to the post. *Baron Rothschild* did not run *Marsworth*, sending *Lady May*, a fine daughter of *North Lincoln*, instead; and, in the absence of the much talked of *Rob Roy*, Mr. Merry was represented by *Sir William Wallace*. The remainder, including *Aventurière*, *Farnsfield*, and *Napoleon III.*, have all appeared in public before, with the exception of M. Lefèvre's representative, *Feu d'Amour*, and *Sir J. Hawley's Polyhymnia*. There was an unusually long delay at the post, and the race was fruitful of disappointments; but at last a somewhat scrambling finish between *Napoleon III.*, *Feu d'Amour*, and *Aventurière* ended in favour of the first named by a neck, *Lord Ailesbury's* filly being beaten for second place by half a length. Both first and third have only shown moderate form, and not longer ago than at Stockton August Meeting *Napoleon III.* was signally defeated by *Apology*, who at York the following week succumbed to *Sir William Wallace*, and also by *De Cambis*, who also at York was beaten by Mr. Merry's colt. On public running, therefore, *Sir William Wallace* ought to have won the Champagne, yet he was one of the first beaten, and the extraordinary change of form displayed by him and *Napoleon III.* in the space of one month can only be explained by the fact that moderate horses beat, and are beaten by, one another with bewildering uncertainty. *Marsworth* apparently would have had little difficulty in securing the Champagne, and through *Feu d'Amour* M. Lefèvre can tell exactly what *Écosais* could do with the winner. *Napoleon III.* is a son of *King John*, whose stock have at present acquired no reputation for stoutness, and despite his victory last week we doubt whether Mr. Fisher's colt will prove an exception to the rule. We cannot, however, discover that he has any other engagement of importance this season. The only other two-year-old race at Doncaster that threw any light on the Champagne was a Sweepstakes on the Thursday, won by *Farnsfield*. *Farnsfield* at one moment looked very like winning the Champagne, but died away at last in such a manner as to create the idea that the distance was too far for him, and finished fourth. Yet, two days afterwards, over a longer course, *Farnsfield* won simply by superior gameness from *Rostrevor* and *George Frederick*; and it is noticeable that in the rich Municipal Stakes, run on the Leger day, *George Frederick*, the fine-looking brother to *Albert Victor*, made an easy victim of *Apology*. On the whole, we may say that the two-year-olds that ran at Doncaster have no pretensions to rank in the first class.

The general racing of the week was fully up to the mark. A good field of twelve contested the Great Yorkshire Handicap, including our old friends *Kingcraft* and *Falkland* (strange that a Derby winner should be kept in active training for three years afterwards, and, though perfectly sound and well, be utterly unable to win any sort of race at any sort of weight!), *Lilian*, *Freeman*, *Flurry*, and *Sister Helen*. The surprise of the race was the forward position of *Sister Helen*, whose reputation has been made on short courses; and up to within a hundred yards from the finish she held a most commanding position. In the end, however, there was an interesting struggle between *Freeman* and two lightly-weighted three-year-olds, *Pirate* and *Mestizo*, resulting in the victory of the former by a length over Mr. Merry's horse. Though beaten, *Freeman*, who was giving much more than weight for age to the first and third in the race, acquitted himself quite well enough to increase the confidence of the supporters of his stable companions, *Marie Stuart* and *Doncaster*, for the great race of the week. *Kingcraft*, as usual, ran miserably, and it really can be of no use to keep him in training. We may add that all the mixed races of the first day in which two-year-olds took part were carried off by the youngsters; the *Fitzwilliam*, the *Clumber*, and the *Stand Stakes*, added to the Champagne, the Glasgow, and the Filly Stakes, making altogether a regular benefit for the two-year-olds. The Portland Plate was this year an additional

attraction to the Leger day, and, as usual, brought out a large field of speedy horses. Among the twenty-three were such well-known animals as Oxonian, Blenheim, Conspiracy, Highland Fling, Madge Wildfire, Wilberforce, Chesnut, Osur de Lion, Maid of Perth, and Fisherman. A better field for a race of this description could hardly have been collected together, and, as usual, there was a long delay at the post, and a great struggle for the advantage of the start. As usual, too, Oxonian, who is well used to this sort of business, jumped off with the lead and maintained it for three parts of the distance. Then Conspiracy, Blenheim, and Grand Flaneur passed him, and he was immediately eased, having a second engagement the same afternoon, which he successfully fulfilled. A good race between the three named ended in favour of Grand Flaneur by half a length, Blenheim beating Conspiracy by a length for the second place. Oxonian could undoubtedly have been in the first three; but, as he could not win, he was not persevered with, and came out an hour later with 5 lbs. less on his back for the Corporation Stakes, which he carried off easily from Trombone, Albani, Thunderer, and Miss Stockwell. The Queen's Plate brought out Winslow, Shannon, Manille, and Oingalina; but the race was confined to the first two, Manille's chance being unfortunately put out by a serious disappointment, owing to Shannon boring him towards the rails at the very moment that Custance was bringing Winslow up between her and the rails. Thus beset on both sides, Manille was altogether jammed out of the race, and as nearly as possible knocked down into the bargain. Not only so, but, when Manille was disposed of, Shannon continued her unpleasant attentions to Winslow, and so pressed him against the rails that it was a wonder he did not fall or tumble over them. He managed to escape the danger however and won—easily at last—by half a length. It was not wonderful that Custance should lodge a complaint against Chaloner, and though the Stewards acquitted the latter of any evil intention, they advised him to be "more careful in future."

On the Thursday The Colonel continued his victorious career by winning the Scarborough Stakes from his solitary opponent John; and Mr. Merry was recompensed for his disappointment with Highland Fling in the Portland Plate by carrying off the Alexandra Plate—the more valuable prize of the two. At the same time fortune has been pretty favourable to Mr. Merry this year. It was obvious in the Portland Plate that Highland Fling not only got off badly, but was also disappointed in the running; and as she was meeting Oxonian in the Alexandra Plate on 7 lbs. better terms, she was again supported, especially as the distance—one mile—was not altogether Oxonian's favourite course. Besides this pair Drummond, Alaric, Montargis, and Duke of Cambridge—whilome favourite for the Goodwood Stakes—ran, and the field in all numbered twelve. Oxonian, as usual, made the most of the running, but Highland Fling proved too good for the old horse in the last quarter of a mile, and wore him down, winning easily at the last. Montargis made a good fight for third place, but the extravagant anticipations formed of his abilities last year are not likely to be realized. Drummond, if in form, ought to have been nearer than sixth, but M. Lefèvre was altogether out of luck throughout the week, and though he brought fifteen horses to Doncaster, he only succeeded in winning one small race. The Eglinton Stakes proved an easy affair for Thorn, who had La Jeunesse and Rostrevor at his mercy throughout; and thus the old day of the racing and the grand day of the yearling sales come to a satisfactory conclusion.

The Cup was the great event of the last day of the week, but of the crack horses only Winslow was engaged, and we should have thought he might have been reserved for this race, and have left the Queen's Plate on Wednesday alone. At any rate he looked as if he had done quite enough work for the present, and would be glad of a rest; and when called upon half a mile from home to make an effort, he seemed quite powerless to respond. Uhlan, Lilian, Thorn, and Field Marshal were the other runners for the Cup; and Mr. Savile's pair finished first and second. Winslow was palpably unfit to exhibit himself in his true colours on this occasion, and Field Marshal was of course not good enough to win. The interest of the race, therefore, lay between Thorn and Mr. Savile's pair, of whom Lilian made the running for her stable companion. She accomplished her duty very effectively, and, strange to say, when her task was done, and Uhlan had the race safely in hand, she came up again full of running, and deprived Thorn of the second place without an effort. Had her jockey made an effort to catch Uhlan—who won in a canter by six lengths—there might probably have been a repetition of the Leger finish between two stable companions. We are more than ever convinced that there is not much to choose between the pair; and after their Doncaster race few people, we think, could arrive at any other conclusion. The Prince of Wales's Plate attracted another good field of the same class as contested the Alexandra and Portland Plates. Among the twelve were Blenheim, Montargis, Sister Helen, Devotion, Maid of Perth, Alaric, and Duke of Cambridge; and the distance being much more to Sister Helen's taste than the long course for the Great Yorkshire Handicap, she was enabled to win, but by a neck only, from Montargis, Devotion finishing a head only from the second. This was one of the prettiest finishes of the week. The mile was too far for Blenheim, and Duke of Cambridge ran as badly as in the Alexandra Plate. The remaining events of the day were easily won, and may be briefly disposed of. Andred secured the Doncaster Stakes from two moderate opponents, and Marie Stuart, with 9 lbs. extra, cantered away in the Park Hill

Stakes from Wild Myrtle, Voyagouse, and Miss Buckland. The St. Leger heroine looked none the worse for her exertions on the Wednesday, and never gave her antagonists the slightest chance. Finally, The Colonel carried off the Don Stakes from Negro and Capuchin without an effort, and the losers amused themselves by running a dead heat for second place.

We must not omit to mention that the yearling sales, though not attracting so large an attendance as usual, went off on the whole in a manner that must have been satisfactory to breeders. The Yardley stud had a good average, a son of Minor and Fern fetching one thousand guineas. One of Mr. Hudson's, a son of Parmesan and Lady Trespass—two of Mr. Cookson's, sons of The Palmer and The Earl—and one of the Glasgow Stud, a son of Lord Clifden—reached the coveted four figures; while the solitary yearling sold by Sir Tatton Sykes—a son of Trumpeter and Marigold, and half brother to Doncaster—fetched eighteen hundred guineas, the highest price of the week. Another portion of Mr. Merry's stud was also offered for sale, and King of the Forest was knocked down for eighteen hundred guineas. Student, St. Mungo, and Macgregor fetched wretched prices; but when we consider the number of stallions in the country, and the glut of blood stock in the market, that is not to be wondered at. If there is anything remarkable, it is the price which blood stock still commands, especially when one glances down the list of buyers, and feels a natural curiosity as to who many of them may be, and as to what use many of them intend to make of their purchases.

REVIEWS.

SYMONDS'S STUDIES OF THE GREEK POETS.*

THE essays which are included in the volume before us contain some which have previously appeared, as the preface informs us, in the *North British* and the *Westminster Reviews*. They popularize the results of scholarship with great ability. They are neither very profound nor flimsily superficial. They hit the right level of pleasurable reading; and while they demand an educated mind for their full appreciation, they yet yield much which will inform and interest those who know merely the broader facts of ancient history and a few of the greater literary names. To the general scholar the last essay will supply a good deal of information regarding the poetry of the Decline, and the various successive collections gathered from many periods of vigour, and incorporating much of the inscriptional, votive, and other monumental poetry from Simonides down to the "Greeks of the Empire." To the more cursory student the first essay may be recommended as a vigorous sketch of the successive periods of Greek poetical literature in its relations with history, philosophy, and art. To all alike the essay on "Ancient and Modern Tragedy," (Chapter IX.,) will be found replete with sources of interest; while the greatest amount of mastery over difficulties is to be found in that which relates to Aristophanes, and the only opinions or estimates of authors with which we broadly differ, in those on the Gnomie poets and on Euripides.

We will speak first of the points on which we differ from the essayist. Less than due importance among the early Gnomie poets is, we think, given to Tyrtaeus, and somewhat scanty justice done to the most intensely vivid impersonation of warlike patriotism which ancient poetry has left us in his strains. Tyrtaeus, if we may credit a legend to which the tenor of his extant verses is entirely true, was himself a commander addressing his troops in those lines so full of martial ardour and love of fatherland, not merely a war-loving poet rousing his fellow-citizens to the shock of battle; and he seems far more worthy of having a specimen translated than the comparatively insignificant Callinus, whose chief fragment even, from which Mr. Symonds translates a few lines, has by several respectable critics been assigned to Tyrtaeus. The latter is further remarkable for the fulness of the echo which he gives to the diction and sentiment of the Iliad. A large part of one of his longest and most characteristic pieces is so largely tessellated with Homeric phraseology as to recall not only the thoughts and images, but to a great extent the language, of Homer.

Neither do we think Minnervus worthy of the disparagement implied in the following remarks:—

Nowhere in the whole range of literature can be found a more perfect specimen of unmitigated ennui produced by political stagnation, by the absence of any religion or morality whatever, and by the practice of mere æsthetic sensuality. In Minnervus we have the prostrate tone of the Oriental, combined with Greek delicacy of intellect and artistic expression.

Minnervus's life is only known to us from the few touches which his works convey. But one fragment, 9 [12] Bergh, lets us know one or two facts concerning him which seem as far as possible from "political stagnation." He there assumes for himself a share in the bustling work of emigration, colonization, and war. The purport of the fragment is as follows:—

We left steep Pylus, the Neleian city,
And reached in ships the lovely Asian strand;
Sweet Colophon then felt our warlike prowess,
By fierce assault our settlement we made.
Thence hailing from the mouth of Heles river,
By heaven's decree Æolian Smyrne won.

* *Studies of the Greek Poets.* By John Addington Symonds. London: Smith, Elder, & Co. 1873.

The fragment 14 [13] Bergk shows at any rate that the poet had sympathies with deeds of the heroic stamp. The few lines of which it consists are a eulogy of some champion described as "routing the dense troops of Lydian cavaliers along the plain of Hermus," and they have a thoroughly Homeric ring; comp. *Od.* xi. 562; *Il.* v. 91, xiii. 127 foll.; *Od.* xxiv. 319; *Il.* xi. 576 and xviii. 242, where the same phrases or sentiments occur. The moral conceptions of Solon, and in a less degree of Theognis, are, we think, very insufficiently set forth, indeed it would seem inconsistently, in the passage p. 76 to 79. It is too long for quotation entire, but the principal points are that, after citing the earlier portion of Fragment 13 [14] Bergk, the essayist adds by way of comment:—

Two points are noticeable in this passage; first the dread of ill-gotten gain; and, secondly, the conception of implacable justice. There was nothing which the Greeks more dreaded and detested than wealth which had been procured by fraud. . . . It would seem as if the conscience of humanity were touched at a very early period by superstitious scruples of this kind. The Jewish law contains warnings similar to those of Solon, and among our own people it is commonly believed that unlawful wealth, especially money taken from the devil, or property wrested from the Church, is disastrous to its owner, and incapable of being long retained in the possession of his family.

After further illustrating from Theognis, who takes it for granted as a thing too obvious to be disputed that children suffer for their father's sin, and argues with Zeus about the abstract right and policy of this law, suggesting that its severity is enough to make men withdraw their allegiance from such unjust governors, Mr. Symonds continues:—

It is in the Gnomie poets that we first discover a tendency to reason upon such questions; the wedge of philosophical scepticism was being inserted into the old superstitious beliefs of the Greek race. And in some respects these Gnomie poets present even a more gloomy view of human destinies than the epic poets. Solon says, It is fate that bringeth good and bad to men, nor can the gifts of the immortals be refused; and in Theognis we find, "No man is either wealthy or poor, mean or noble, without the help of the gods. . . . Pray to the gods; nought happens to man of good or ill without the gods."

But this is surely just what we read in Homer:—

Ζεὺς ἀγαθὸν τε καὶ ἄν καὶ δίδωι, δύναται γὰρ ἅπαντα.—*Od.* ζ.

And, again, we have in the *Iliad* (xxiv. 527 foll.) the two *πίθοι* which stand on the threshold of Zeus, the one of good, the other of ill, which he deals out to mortals. Now, we confess that we do not see in all this anything which can fairly be called either "superstitious scruples," or "sceptical," but at any rate it is not obvious how it can be both. It seems to us rather, that the ethics of Solon and the Gnomie school are still popular rather than scientific, and that they accord sufficiently with those of the *Epos* to be classed generally with them; although, of course, because these poets are Gnomie, ethics in their compositions occupy a more substantive position, being introduced for their own sake, and not to illustrate character or explain incident.

These Gnomists admit—as what moralist does not?—the disproportion between men's moral characters and their earthly fortunes; but, although Theognis goes so far as to remonstrate with Zeus on this subject, he does not seem to question that so Zeus has ordered it, and so it must be. We see nothing here of "the wedge of philosophic scepticism inserted in old superstitious beliefs," Solon indeed strikes a note of more manly and independent spirit in Fragment 15, which we might render:—

Many base are rich, and worthy men are poor,
Yet worth for wealth we'll never barter;
For worth is that which fast abideth evermore,
But wealth is this man's now and that man's after.

Here the wealth (*πλοῦτος*) which measures human prosperity is treated as a fluctuating accessory of man's real estate, whereas the worth (*ἀρετή*) is his own permanent and inalienable endowment. Nor, again, do we think the statement in p. 78 can be accepted, that the Gnomie poets "seem to regard heaven as a jealous power, and superstitiously believe all changes of fortune to be produced by the operation of a God anxious to delude human expectations." And still less can we concur in the summing up in p. 79:—

Truly the people were walking in darkness; and it is marvellous that men conscious of utter ignorance, and believing themselves to be the sport of almost malignant deities, could have grown so nobly and maintained so high a moral standard as that of the Greek race.

It should be remembered that the Greek deities are "of like passions with men," nay, rather resemble men whose passions have been pampered by too much power. They thus promote their favourites, spite their enemies, are sensitive to affronts, and therefore easily offended, and cherish the grudge till it is unpayable off; leaving it often to the offender to discover what deity he has, it may be unwittingly, outraged, and so to solve the riddle of his own sufferings. Thus Odysseus in the *Odyssey* abides Poseidon's wrath. (Æneus in Phoenix's narrative (*Il.* ix. 534 foll.) offends, it may have been thoughtlessly, the goddess Artemis, and the Chorus in the *Ajax* think that that hero may possibly have given similar offence to the same deity. Thus the drama of human life went on, in the Greek belief, with a superhuman agency ever disturbing its plot. That the Gods often shocked the moral sense of their votaries is true, but to represent them as "anxious to delude human expectations," or as "almost malignant deities," is surely a highly overcharged statement. So long as a man's fortunes were consonant to his character and merits, there was nothing to be accounted for, and nothing therefore which need be referred to divine interference. Where those

fortunes deviated from the standard at which moral considerations would have fixed them, there was something to be accounted for, and the deviation was accordingly referred to such interference. But then this on the face of it sets moral considerations on one side, and the motives which actuate Deity on the other. To a certain extent the caprices, resentments, and other passions above referred to as attributed to deities would account for the abnormal course of plaguing a righteous man. Where the case was too glaring for these, or where the sufferer was confessedly exemplary in his personal devotions as well as just, and therefore ought to have been a favourite, his family history was searched, and doubtless there were few such histories in which those who looked far enough back would not find the *id quod dicere nolo*.

We may indeed fairly credit the Gnomie poets with broader views of life than their earlier fellows of the *Epos* could attain, and with the perception that, if justice is to consist in equating fortunes with moral deserts, the divine meddling in human affairs as popularly conceived did not tend to mend matters on the side of justice. On the whole, however, and in spite of the exceptional caprices, &c., of deities, a wholesome belief in a sympathy of the Olympians with right prevailed—not always, indeed, an active sympathy, or one whose activity was expeditious, but still one which in the last resort confirmed the moral sense and consoled the afflicted, even if it postponed the redress of their wrongs. Yet if after all there were cases of human suffering which were irreducible to moral law in Solon's time, we may surely say there are such still, and that without "charging God foolishly." It is the peculiar praise of Solon that, himself a practical politician, he sought to inbed politics in morals, founding both on his favourite principle of *μηδὲν ἄγαν*. And his appeals to the moral sense of his citizens find their last echo in Demosthenes, who quotes him, and with whom Athenian independence disappears.

Mr. Symonds (p. 78) gives a rendering of one particular Solonian fragment (13 [4] v. 65-70, Bergk) which we can hardly approve. The passage seems an easy one at first sight, but is not so. It is rendered by our essayist, "Hunger lies everywhere, nor can a man say where he will end when he begins; for he who thinks that he will fare well comes to grief; and often when a man is at his worst, Heaven sends him good luck and he ends prosperously." The latter part only is objectionable here, of which the original in Bergk's text is

ἀλλ' ὁ μὲν εὖ ἔρπειν περιμένους οὐ προνοήσας
εἰς μεγάλην ἄτην καὶ χαλεπήν ἔπεισεν,
τῆς κακῆς ἔρποντι θεὸς περὶ πάντα δίδωσιν
συντυχίην ἀγαθήν, ἐκδυσιν ἀφροσύνην.

Through slurring *ὁ προνοήσας* in the first line, we think the point of the whole is missed. The difficulty lies in the question, to what degree this phrase should be pressed, and what precise shade of ethical meaning should be given to the previous *εὖ ἔρπειν περιμένους*. But, whatever view be taken on these points, we think that the latter phrase is misrepresented by "he who thinks he shall fare well." Solon, in fact, seems to think that every man should exercise *πρόνοια*, and that for want of it the best intentions miscarry. Thus the lines might be rendered, "The man who tries to act for the best, through his want of foresight falls into huge overwhelming woe, while to the mischief-lover God gives, to crown all, a prosperous fortune—a let-off from his folly."

As regards Euripides, our chief quarrel with Mr. Symonds is that his estimate of that poet fails to recognize his immorality—we mean, of course, as measured by Greek sentiment. The *Medea*, the *Hippolytus*, and the *Bacchæ* are justly singled out by him as plays in which the poet distinctly "breaks new ground," instead of "competing with *Æschylus* and *Sophocles* on the old ground of the *Tragedies* of Thebes and Troy." In *Medea* we have the most diabolical incarnation of revenge which ever darkened a poet's imagination. The guilty can only be struck through the innocent, the defenceless, and those who have the strongest natural claims on the revenger, and therefore these are sacrificed in cold-blooded malice. And she who thus deals with them is made to carry off the sympathies of the audience. How different a lesson from that of the vengeance of Atreus on Thyestes in the *Polopid* legend, which haunts the palace walls and visits posterity with a curse for its unnatural atrocity! As the *Medea* is the worship of revenge, so is the *Hippolytus* that of the morbidly sensual, combined, for the sake of contrast, with that of the hardly less morbidly ascetic. The *Bacchæ* is charged with a revolting sympathy for orgies which consecrated a shameless self-abandonment. The exquisite beauty of the poetic vehicle in these cases is undisputed, but that only renders the prostitution of genius more shocking. There is in these three plays, the typical products of Euripidean genius, an amount of complaisance with wickedness which strikes a moral level far below that of any of the earlier masters, epic or tragic. Nor is it enough to say (p. 198) that "the clear intuitive morality of *Sophocles* has been exchanged (in Euripides) for sophistry," unless "sophistry" includes a Satanic perversion of the ethical standpoint. No doubt Euripides chimed in with the tendencies of the age, but he gave them a determination in favour of what is revolting to the better instincts of humanity which of itself was disastrous to public morals. These considerations ought largely to qualify our estimate of Euripides. He found the tone of tragedy one of relative purity and he left it debased.

There is much to commend in the treatment of Pindar, and in the chapter which deals with that last developed flower of the Greek Muse, the *Idyllic* poetry of Theocritus and his compeers.

Under the former head, after pointing out the circumstances of the leading contests, Mr. Symonds says:—

The three chief commonplaces of Pindar, therefore, are *δαῖς*, *ἀρετή*, *εὐρυχία*, wealth or prosperity, manliness or spirit, and blessings independent of both, god-given, not acquired. But it could not be that a great poet should ring the changes only on these three subjects, or content himself with describing the actual contest, which probably he had not witnessed. Consequently Pindar illustrates his odes with myths or stories bearing more or less closely on the circumstance of his hero. Sometimes he celebrates the victor's ancestry, as in the famous Sixth Olympian, in which the history of the Iamidae is given; sometimes his city, as in the Seventh Olympian, where he describes the birthplace of Diagoras, the island Rhodes; sometimes he dwells upon an incident in the hero's life, as when in the Third Pythian, the illness of Hiero suggests the legend of Asclepius and Cheiron; sometimes a recent event, like the eruption of Etna, alluded to in the First Pythian, gives colour to his ode; sometimes, as in the case of the last Pythian, where the story of Medusa is narrated, the legendary matter is introduced to specialize the nature of the contest. The victory itself is hardly touched upon. The allusions to *δαῖς*, *ἀρετή*, *εὐρυχία*, though frequent and interwoven with the texture of the ode, are brief; the whole poetic fabric is so designed as to be appropriate to the occasion, and yet independent of it. Therefore Pindar's odes have not perished with the memory of the events to which they owed their composition.

All this strikes us as both true in itself and admirably put.

Mr. Symonds, we ought to add, is never so much at home as when illustrating ancient modes of thought by modern parallels. His weak point is that he rather overdoes this. There is no illustrating power in parallels which lie so remote as to be out of sight of each other. In this light we regard his comparison of the Olympian games to the "Derby Day"; which in its converse form is a penny-a-liner's commonplace, at once vulgar and hackneyed enough for that class of writers to be allowed undisputed possession of it. Less objectionable on grounds of taste, but equally unreal, is the exclamation (p. 259) "Had Mozart received a good translation of the *Birds* instead of the wretched libretto of the *Zauberflöte*, what a really magic drama, what a living image of Athenian comedy he might have produced!" Mozart, we venture to say, would have been at his wit's end to know what to do with such material. The fundamental hypothesis, the machinery, and the scenic and characteristic developments of the play, would have been neither natural nor supernatural in any sense for which he could have found a vehicle. The brilliancy of a few lyrical passages and the brisk comic business of a few manageable scenes have probably led Mr. Symonds into this romance of similitude. Worse for other reasons we think the remark (p. 172), "When he (Pindar) refuses to believe that the immortals were cannibals and eat the limbs of Iphigeneia, he is like a rationalist avowing his disbelief in the doctrine of eternal damnation." It is easy to show that cannibalism offends even a low moral instinct, and that no other moral instinct can be alleged in its favour; whereas the view taken of the "doctrine" referred to depends on how much stress is laid on what Bishop Butler calls "simple absolute benevolence," and how much on another equally ethical quality, balancing this latter, in the conception of deity, to any nothing of analogies of human experience, which have their force even if the conception of deity be left for argument's sake out of the question.

The writer feels that with his "aim in view" (of "bringing Greek literature home to the general reader") he "may have been led into extravagances of style." And it would not be difficult to cite a good many passages in which we feel carried off our legs by the rush of promiscuous imagery; but this is readily condoned by a reader of any generosity, as a result perhaps inseparable from the enthusiasm for his subject without which the book would lose all its fascination and much of its solid value. On the whole, although the stern and chastened sobriety of the scholar's judgment will find here and there a gew-gaw or patch of tinsel at which to shake his head, yet the great number who, without becoming scholars, have had their minds coloured with the tints and warmed with the radiance of scholarship, will be able to refresh the colouring and rekindle the glow by means of these essays. And all who wish to know and to own what a great debt the modern world of thought owes to the ancient, as they find the poets the best interpreters of that ancient world, exceeding far in the hermeneutics of feeling all that we find in philosophers, historians, and orators together, so they will find in Mr. Symonds an excellent interpreter of the ancient poets in a very moderate compass.

THE PEARL OF THE ANTILLES.*

THE Pearl of the Antilles, as we perhaps ought to say for the benefit of hasty readers, means Cuba in that peculiar language in which the titles of books are generally written. We should be disposed to doubt whether it would not be better to call Cuba Cuba; but we must presume, judging from the prevailing practice, that there is a class of readers whose attention is arrested by a picturesque name, just as a dish sounds more appetizing when described in French. Mr. Gallenga's account of Cuba is, however, interesting, whatever its title. He remarks very truly that there is great difficulty in obtaining any trustworthy information as to the perplexed incidents of the Cuban rebellion. The Spanish people, with all their merits, are not inclined to adhere to prosaic reality in their reports of current history. The American Correspondents, who show commendable industry in interviewing the most inaccessible people, write with a bias which much diminishes

the value of their information. The whole affair moreover has so many complicated bearings that very few people could give valuable evidence, even if they were willing to give it freely. Mr. Gallenga has apparently done all that can be done by an intelligent tourist to form a correct opinion under the circumstances; and his evidence, as far as it goes, is of great value. We may indeed doubt whether a flying visitor, however good an observer and however well provided with introductions, can really penetrate to the bottom of the strange chaos of Cuban society. To take a single instance; Mr. Gallenga visits the plantation of Don Julian de Zulueta, a gentleman who, starting without a farthing, has made a great fortune, is the owner of several estates worth some six million dollars, has a private railway, a large mercantile establishment, and is the life and soul of every public institution, political or social, in Havannah. Such a man is certainly qualified, if any one can be so, to speak with authority upon Cuba. But when Mr. Gallenga tells us that the slaves of this exceptional master are fat, sleek, and merry, that they cluster round him joyously crying, "El Amo! El Amo!" as though he were a demigod, and that they work with spontaneous enthusiasm to carry out his wishes, we cannot take the facts as a conclusive proof of the well-being of the slave population in general. A visitor, and especially a visitor about to make his inquiries public, is apt to see the brightest side of things; and as Mr. Gallenga has a very low opinion of the morals and intelligence of the great mass of the native population, we cannot doubt that a genuine inspection of other estates might have revealed to him the existence of a very different state of things. His view, indeed, of the general condition of the negro population does not seem to be very decided, except in regard to one point. Emancipation, he tells us, is inevitable, whether slavery be in itself a good or a bad system; but the great, and apparently the insoluble, problem is to discover the means of effecting a safe transition from one social state to another. How great the difficulty is may, indeed, be realized from a brief recapitulation of some of the main facts which Mr. Gallenga has set before us.

The population of Cuba, according to the census of 1867, was 1,370,211, of whom 764,750 were white, while 605,461 were coloured. Of the last again 225,938 were free and 379,523 slaves. These figures suggest a very different state of things in Cuba from that which holds in the English colonies and in the Southern States of the Union. The whites, it will be seen, were in an actual majority, and something like two-fifths of the coloured population was already free. So far Cuba would seem to be in an advantageous position; emancipation would apparently affect a very much smaller proportion of the population than was the case in such countries as Jamaica or South Carolina. To all appearance it would affect chiefly the large planters, and there must already be a nucleus of free labourers, of whose condition we hear less than we could wish. The prosperity of the island would indeed be materially affected, for it apparently rests upon a most precarious basis. By one of those apparent contradictions not uncommon in accounts of slave countries, we are told on the one hand that everybody who goes to Cuba can make a fortune in a few years, and on the other, that nearly all the planters who might be supposed to profit by the demand for their produce are in an embarrassed condition. There are not more than 120 planters, we are told, out of 1,500 who could stand the slight increase of taxation which would follow upon the adoption of certain proposed reforms. The prosperity of the island, it is inferred, can only be maintained "by working the slaves to the full extent of their power." The cause of this state of things is said to be the rapacity of the Spanish officials, the ruin brought about by the war, and the inefficiency and want of skill of the proprietors. We venture to guess that this last cause deserves a little more emphasis, and that we have here one more illustration of the general inefficiency of slave labour. The indebtedness of the planters is by no means peculiar to Cuba, and the slaves of these embarrassed people have probably a worse time of it than the sleek and slug-like dependents of the admirable Don Julian de Zulueta. Emancipation would very probably produce widespread ruin, and diminish the production of sugar; but, after all, it would lead to the destruction of a thoroughly rotten social system.

The problem, however, is far more complicated, owing to a different order of causes. The white population of Cuba, instead of being united as against the slaves, is divided into two hostile camps, hating each other with a hatred compared with which the hatred of Fenians for English, or of Italians for Austrian rule, is but a mild and temperate sentiment. The cause of this intense antipathy is remarkable. The Spanish society in Cuba, as the traveller at once remarks, is almost exclusively male. Amongst the whites in Havannah there are more than three men to one woman. The Spanish emigration, in fact, consists exclusively of men, attracted by the high wages, and coming, as a rule, from the hardiest populations in the old country. It has to be kept up by constant supplies, for the Spaniard, though better adapted for hot climates than the Englishman, is unable to acclimatize himself in the terribly depressing influences of Cuba. The consequence is that degeneracy and disaffection invariably set in in the second or third generation. The students who were cruelly put to death for a riot in 1871 belonged "to the most conservative and ultra-Spanish families in Havannah," and a rich relative of one of them, himself a leader of the Spanish party, vainly endeavoured to ransom his cousin for a million dollars. Between these two races, so closely allied in blood, there is an antipathy coloured by intense contempt on one side and impotent rancour on the other. The Spaniards,

* *The Pearl of the Antilles*. By A. Gallenga. London: Chapman & Hall. 1873.

though in a small minority numerically, not more than 150,000 out of a total of 700,000, are masters by their native energy, and because they include the regular army and the strong volunteer battalions. These volunteers form the real strength of the existing aristocracy. Originally formed on the expulsion of Queen Isabella, they rapidly became the masters of the country; they organized themselves according to their own pleasure, garrisoned the chief forts, banished the regular troops, and had all the authorities under their thumb, and only suffered such laws to be promulgated as seemed good to them. Practically they are under the management of the Spanish Club, a voluntary institution which is about as independent as the Paris Commune. They shelter themselves under the name of Spanish authority and profess to be loyal to the mother-country; but their allegiance is of the slightest, and only exists on condition of their being allowed a practical supremacy in the affairs of the island. The volunteers number about 60,000 men, and, in the opinion of Mr. Gallenga, would be able in case of need utterly to crush the more numerous, but feeble, degenerate, and unarmed Creoles. The number of regular troops who have been sent to Cuba since 1868 is no less than 80,000, by far the greater part of whom have, however, been destroyed by disease and the hardships incurred in hunting insurgents. Against this oligarchy of slaveholders and Spanish officials is directed all the hate of which the effeminate Creole is capable. How far the slaves are ready for revolt it is indeed impossible to say, though a good many have joined the insurgents. Mr. Gallenga mentions one touching fact. Since the proclamation which promised freedom to all negroes born after a certain date, the mothers, who formerly could hardly be persuaded to take the trouble of rearing young slaves, have been proud of the babies destined to liberty. The nurseries are crowded to a degree never before known; though, it is added, the negro who has had practical experience of the advantages of freedom is by no means so deeply penetrated with a sense of his own dignity, and neglects the black heirs to human rights as cruelly as the original slave. However this may be, the temporary change implies the existence of a strong feeling amongst the negroes, which might under slight provocation give rise to an attempt to make another Hayti out of Cuba.

With such feelings smouldering in the breasts of a large majority of the population, and met by the sternest repression of every overt manifestation, it is no wonder that the rebellion drags on, gradually increasing in ferocity on both sides. The rebels, indeed, are contemptible in a military sense. Mr. Gallenga estimates the forces which they maintain at about eight thousand men. They keep carefully in the uncultivated districts which form so large a part of the island, and confine their military operations to the devastation of some outlying plantations. The Spanish troops are unable to act during some six months of the year. In the remaining months they send out expeditions which advance by some narrow track through the dense tropical forest. Presently a shot or two is fired from an ambush with more or less effect, and, as soon as the troops come up to the assault, the rebels disperse to a remote fastness. The commander of the expedition returns with a mule or two and half-a-dozen prisoners, or, it may be, with a trifling loss, and publishes a pompous bulletin with as much truth as he cares to insert. And so this wretched warfare drags on, not without some suspicion that the troops are not too anxious for complete success, because somebody or other finds his account in keeping the war on foot. Meanwhile, if Mr. Gallenga is to be believed, hideous atrocities are perpetrated on both sides. The nearer he came to the scene of action, he says, the more reason he found to believe in the truth of these revolting stories. When the insurgents take a prisoner they tie him by his feet to a tree, and then light a slow fire under him. No quarter appears to be given on the other side; the soldiers and volunteers have acquired peculiar skill in the use of the *machete*, a kind of cutlass universal in the sugar-growing countries, with which they cut off a man's head with much ease and dexterity. Men prepared with this weapon march in the rear of every detachment, ready for practice. Still more revolting stories are told of outrages upon women; and, in short, the war, if it deserves to be called by that name, seems to be as brutalizing as it is easy to conceive. Large districts have been turned into deserts. In one province the rural population was driven together into a small farm, where the overcrowding produced an outbreak of deadly diseases; and, whilst the population was dying, the soldiers laid waste the country, burning crops, slaughtering cattle, and gutting houses, by way of "starving out the rebellion."

To complete the picture of Cuban society, something ought to be said about the Chinese, who, having been introduced in large numbers to labour on the plantations, turn out to be unfitted for their work, are extremely resentful of the treatment they receive, and have to be executed for murder at the rate of some fifty a year. The whole picture is melancholy enough, and the prospect of anarchy or servile insurrection produced by a rash attempt at emancipation is always in the background. We do not attempt to draw any distinct moral, or to criticize the measures of reform which Mr. Gallenga notices as being most approved by judicious observers. One hardly knows whether to wish for a decided explosion at once or for a protraction of this intermediate state in the faint hope of a peaceful development of the situation. The problem of the future of the beautiful islands of the West Indies is indeed a troublesome one; and we have the additional reflection in the case of Cuba that very little help is to be expected from the mother-country. The only apparent choice is

between anarchy and a specially cruel despotism; and meanwhile provision is being made for a debt of hatred which can hardly be paid off for generations.

ALFRED'S GREGORY.*

IT is not many weeks since we got a glimpse of a Semi-Saxon, most likely the last of his tribe; still, after such an apparition, it is comforting to come upon an editor who insists on calling the language of Alfred as Alfred called it himself. Most writers take upon them to correct the royal scholar, and to explain to him that, when he thought he was writing "on Englice," he was lying under the strange mistake of thinking that he was writing in a language which really did not exist till some hundreds of years after his time. The prince who with such minute accuracy described himself as "Rex Saxonum" most likely knew what he was about when he called his own speech "Englisc," but Mr. Sweet is one of the few who will give him credit for such a degree of sense. The very first thing that Mr. Sweet tells us is—

I use "Old English" throughout this work to denote the unmixed, inflectional stage of the English language, commonly known by the barbarous and unmeaning title of "Anglo-Saxon."

Mr. Sweet's epithets for a moment seemed to us too strong, but the next moment's thought showed us that he was right. "Rex Anglo-Saxonum," as a contraction for "Rex Anglorum et Saxonum," is neither unmeaning nor barbarous; but it is unmeaning and barbarous to talk of the "Anglo-Saxon language," because what is meant is not a language spoken by Angles and Saxons, or a language made up of Anglian and Saxon, but simply the language of Englishmen of any kind up to—we do not exactly know when, but whenever the "Semi-Saxons" begin. We hail Mr. Sweet as a most valuable helper in our humble but hard task of persuading Englishmen that they always were Englishmen, and that, if you take 449 from 1066, there remains 617. Mr. Sweet is the furthest of all men from believing, as so many of our friends do, that all the people who lived and died in those 617 years lived at the same time. He does not enter on architectural questions; but we feel quite sure that, if he did, he would not argue that, if the Scots built of wood in the eighth century, therefore the English could not have built of stone in the eleventh. Mr. Sweet's great object is to root up some closely allied errors with regard to his own subject of language. We might be sure beforehand, without any direct evidence, that any language must change a good deal in 617 years. At the same time we fully admit that the English language was not likely to change so much in those 617 years as in the 617 years which followed them, nor likely to change so much as both the Romance and the Teutonic languages of the Continent were likely to change during the same 617 years. Still, in any case the change must have been enough to leave its mark on the language. Of course no philologist, no scholar of any kind, ever denied this; some scholars have insisted upon the fact; but the lurking notion, working in the minds even of men who would have been eager to deny any such belief in words, that all "the Saxons" lived at one time, has often kept it from being allowed its full prominence. Mr. Sweet claims to be the first man who has edited any work of Alfred from a manuscript of the time of Alfred. He tells us:—

A curious feature in the history of Old English philology is the neglect of the older documents of the language; not only are the forms that appear in our grammars and dictionaries West-Saxon, to the almost entire exclusion of the equally important Anglian and Kentish dialects—they are to an equal extent, late, as opposed to early West-Saxon. The cause must be sought in the early history of the study of Old English in this country.

The cause, according to him, is that, when men began to edit Old-English books, they found the later manuscripts much easier to read than the earlier. The result was that they "gradually came to regard the older ones as abnormal or dialectic variations from the regular language preserved in the later works." The process is much the same as the old-fashioned schoolmaster way of learning Greek, when the boy was told that there was a Greek language with certain forms, from which forms the forms used by Homer were a dialectic variation, Ionic, epic, or what not. Of the later manuscripts, from which Alfred's works have hitherto been printed, Mr. Sweet further remarks:—

Although they follow the words of Alfred with more or less accuracy, they alter the orthography to suit that of their own period, so that the characteristically Alfredian forms appear only sporadically, and are consequently regarded as scribal errors by editors. An unfortunate result of the partial retention of the original forms is, that these MSS., while giving but a garbled representation of the language of Alfred, can as little be taken as faithful guides to that of their own period.

He tells us truly that, to get at the real forms, we must compare contemporary manuscripts of Alfred's writings with contemporary manuscripts of writings of the eleventh century. Thus we shall get the genuine forms in use at the two periods, instead of a mixture of the two. There is of course this difference between the Greek and the English case, that the English of the eleventh century is a genuine language, differing from the English of the ninth century only by those natural changes which must take place in all languages, while the *κοινή διάλεκτος* of Greek is no genuine Greek dialect at all, but a mere artificial literary language, which people wrote while they talked some-

* *King Alfred's West-Saxon Version of Gregory's Pastoral Care*. Edited by Henry Sweet, Esq. London: Published for the Early English Text Society by N. Trübner & Co. 1871-1872.

thing else. Of all the works of Alfred, the only ones which exist in contemporary manuscripts are his translation of Orosius and that of the Pastoral of Gregory the Great which Mr. Sweet has now edited. He gives us the texts of two manuscripts, both contemporary, being, as he shows, two of the copies which were made at the time, one of which was to be sent to each of the Bishops in Alfred's dominions; or rather one of them is one of the still earlier copies from which the copies which were to be sent to the Bishops were to be made. Mr. Sweet however does not venture to claim either of his copies as Alfred's own autograph. He goes most minutely through the various differences in spelling and in grammatical forms to be marked between the earlier and the later specimens of the inflexional stage of our language, and also through the differences of handwriting in the earlier and later manuscripts.

This last point leads us to the fact that Mr. Sweet has yet another theory of the history of the letter Thorn in its two forms. We have been told that δ is *th* in *this*, and that θ is *th* in *thing*, and we have also been told the exact opposite. We have also been told that there is no difference between δ and θ , but that both express the same sound, just like the different forms of the Greek Sigma and Theta; and we have also been taught that this one sound is that of *th* in *thing*, the Greek θ ; and that the *th* in *this*, the modern Greek δ , the Welsh *dd*, is an intruder which has crept in unawares; some even venture to say that it has crept in from the Welsh. There is the known fact that it has crept in, and that rather lately, in some words, as *father*, *mother*, *hither*; but there it has supplanted, not the other *th*, but a *d*. Mr. Sweet now gives us his view of the matter, which is quite different from any of these. He traces out the whole history and nature of the δ sounds from the very beginning, and he rules that the Thorn had in the oldest stage of English always the power of *th* in *this* (the modern Greek δ , the Welsh *dd*), but that afterwards it got the sound of *th* in *thing* (the Greek θ) at the beginning of words, keeping the other sound in the middle and end. Lastly came the stage in which we are now, in which we give it the θ sound at the beginning and end of words, and the δ sound in the middle. The few pronouns and other words in which we still give it the δ sound at the beginning, Mr. Sweet looks on as traces of the earlier pronunciation surviving, as older traces of this kind often do, in words of this particular class. Mr. Sweet denies that the δ and the θ are used indiscriminately, though each is used, under different circumstances, both for the δ and for the θ sound. He holds that θ as well as δ was formed from the Latin *D*, or rather perhaps θ from *D* and δ from *d*. This he makes into an argument to show that, when they were introduced, the only sound of the Thorn was δ and not θ . The oldest manuscripts use one or the other form pretty exclusively; both the manuscripts of the Pastoral use δ and not θ . Others of the same date use θ and not δ . In the later manuscripts the rule is much the same as with the different forms of Greek letters, some of which have been got rid of by modern printers; as σ and ς , ϕ and ϕ , ω and ϖ . θ is used at the beginning, δ in the middle and ending of words. The exceptions to this rule are much less frequent in the manuscripts themselves than they are in the books printed from them. If such a word as *broþor* happens to be divided between two lines, the Thorn in the second half of the word becomes initial to the eye, and the word is written *broþor*. In the printed book the whole word perhaps comes in the same line and is printed *broþor*, which the ancient scribe would not have written. On the other hand, when two or three small words—pronouns, adverbs, and the like—are written together, the initial Thorns become medial to the eye, and “for þam þe” becomes “forðanðe.” This is something like the varying use in certain Greek compounds, as whether we should write $\pi\rho\sigma\epsilon\phi\iota\omega$ or $\pi\rho\sigma\phi\iota\omega$, a question which the printers decide in favour of the eye and against the etymology. From this usage, Mr. Sweet thinks, came the not uncommon practice of writing pronouns with a δ , even when they stand by themselves, not as marking any difference of sound, though it strikes us as quite possible that this usage may have helped to keep up that difference of sound between *this* and *thing* which has been handed on to our own times. The whole of this Appendix contains a great deal of matter bearing on the spelling and pronunciation of various letters in the oldest manuscripts which is of great philological importance. The *f* and *v* letters have gone through much the same history as the Thorns. Of course it is not for us to say dogmatically that Mr. Sweet is right in every detail of his theory; but it is a theory which, to say the least, is put together with great care and carries much probability with it, and it certainly deserves the best attention of Teutonic scholars and of philologists in general.

The title-page promises us the Latin text and an English translation, but in the preface we are told that “the publication of the Latin text must be postponed for an indefinite period.” Mr. Sweet also tells us that “the English translation is added more from deference to the usage of the Early English Text Society than from any conviction of its utility.” We presume that the phrase “English translation,” so contrary to the doctrine which Mr. Sweet sets forth, is also used in deference to something or other. Mr. Sweet adds:—

In fact, I look upon a translation to a text like this, which is of exclusively philological interest, as so much waste paper, utterly useless except to the merest tyro—useless even to him, if he wishes to acquire a sound knowledge of Old English, a language, which, like all others, ought either to be studied properly with grammar and dictionary, or else let alone. I have also endeavoured to translate into the received language of the present day, and have carefully avoided that heterogeneous mixture of Chaucer, Dickens and Broad Scotch, which is affected by so many translators from the Northern languages.

Here we do not quite go along with Mr. Sweet. It is often very useful, in reading a book in an old form of any language, to have beside it a version in the modern form of the same language. We say this just as much of Old-German as of Old-English. A modern French or modern German translation of an Old-French or Old-German book serves a purpose which a Latin or English translation does not serve. And Mr. Sweet is perhaps a trifle too contemptuous towards many who are not such finished scholars as himself, but who have occasion to make use of Old-English, Old-French, or Old-German writings, and who wish not to be wholly dependent either on translations or on second-hand authorities. To such persons a translation into the modern form of the language is often a real help without being at all what Mr. Sweet evidently fears lest it should be made a substitute. We do not know what Mr. Sweet means by the “heterogeneous mixture of Chaucer, Dickens, and Broad Scotch.” Our notion of a translation for the purpose of which we speak is one which should depart as little as possible from the original, which should in fact be rather a modernization than what is commonly understood by a translation. Mr. Sweet’s “received English” goes too far away from the original for our purpose, and we therefore share his doubt as to its utility.

MIRANDA.*

MR. MORTIMER COLLINS might just as well have called his latest story *Sobieska*, or *Edith*, or *Margaret*, or *Ells*, or *Seroza*, or *Myfanwy*, as *Miranda*; for each of these young ladies can lay good claim to the part of heroine, and each has a most heroic lover provided for her. *Margaret* or *Myfanwy* moreover would have equally well afforded that elegant alliteration in which the author of the *Marquis and the Merchant* so much delights. We would suggest that, if ever this book should reach a second edition, it should be brought out under the title of “*Margaret, Myfanwy, and Miranda: a Midsummer Madness*, by Mr. Mortimer Collins, author of the *Marquis and the Merchant*.” Mr. Collins, while he by the title admits that his book is not altogether sane, yet takes as his motto, “Though this be madness, yet there’s method in’t.” We are not disposed to allow that there is either madness or method. There is a very dull parody of the former, and an entire absence of the latter. He has strung together a number of the most extravagantly absurd incidents, and as for method—save that he has as usual filled out three volumes containing about the same number of chapters and the same number of pages—he has shown none. Could we conceive that his book is meant as a parody of Mr. Henry Kingsley’s style of writing, there might have been some degree of humour in it, had it been only one-twentieth or so of its present size. But a parody in three volumes is out of the question. Still we have no doubt that Mr. Collins, likely enough quite unconsciously, has been fired with a generous spirit of rivalry as he read the wild extravagances of Mr. Kingsley, and has thought that against his muscular Christian he would try to match a muscular Heathen. We had thought that *Oakholt Castle*, which we lately noticed, was of all the novels which we had ever seen the silliest. Let Mr. Henry Kingsley take comfort. So long as Mr. Mortimer Collins writes there will be one novelist to surpass him. We are glad to find that Mr. Collins complains that “the public don’t like my novels.” It may be the case that by the time the public has read its *Daily Telegraph* and Mr. Henry Kingsley its appetite is satiated. It may be the case that Mr. Collins fails through not giving that occasional religious tone which goes so far to cover the faults of the sensational novelist and the sensational newspaper. Be this as it may, we will venture to hope that, if “the public don’t like” reading Mr. Collins’s novels, he will soon leave off writing them. The age may have all the faults that Mr. Collins attributes to it. It has truly one merit, in that it is somewhat saner than some among its writers. There is only one thing more wearisome than reading such a story as *Miranda*, and that is writing about it. How is it possible to criticize or to analyse a story which combines all the absurdities of some old nurse’s tale with a pretence of scientific knowledge and the English that has the largest circulation in the world? We have silly superstitions disguised under the fine names of spiritual or mysterious magnetism, magnetic attraction, the clairvoyant faculty, presentiments and intuitions, and the rest. If we are to have this kind of story-telling once more, let us go back to our nurseries and have it told in the simple English that did not misbecome it. And it is not only the vast number of extravagant incidents, but also the almost equally vast number of extravagant heroes and heroines, that renders it nearly impossible to give our readers any notion—we do not say intelligible notion—of the story. We ourselves, though we have just laid the third volume down, have scarcely any clearer understanding of what we have read than we have had of the plot of a pantomime when the curtain has at length fallen. Mr. Collins is a scholar—at all events he quotes Greek and Latin very often, and uses long and strange words apparently of classical origin. We wish that in writing his story he would have remembered Horace’s trite line:—

Nec gemino bellum Trojanum orditur ab ovo.

The first young lady, who is introduced with all the pomp and circumstance and spiritual magnetism to boot that suit a heroine, is found to be only the grandmother of *Miranda*. She is as ruthless

* *Miranda: a Midsummer Madness*. By Mortimer Collins. 3 vols. London: Henry S. King & Co. 1873.

lessly swept away as ever were the characters in the first act of some youthful poet's first tragedy. She had not, however, lived in vain; for it was from her "spiritual magnetism—whether it is a matter of imagination, or of will, or physical change"—that came a considerable portion, though not all, of the presentiments and intuitions and magnetic influences that characterize the story. Her husband, Dr. Tachbrook, survives to the end of the story, and in the last chapter, going into Parliament, "a noble old man with white hair and beard calmly took his seat below the gangway on the Opposition side," and greatly interfered with Mr. Gladstone's calmness by at once carrying a motion against him by a majority of three. But we are anticipating matters, and trying to jump over that dreary waste which lies between the second chapter of the first volume and the end of the book. For the present our readers may be satisfied with knowing that Dr. Tachbrook "was a man with a considerable taste for mystery, though he possessed a keen, clear brain which allowed it to be obfuscated by no hallucinatory cobwebs." He had first made his future wife's acquaintance when she was in a "cataleptic trance." On her return to consciousness, after five days passed in the trance, he administered to her "a tumbler of champagne with a dessert-spoonful of brandy in it," and detected in her eye "a scintilla of violet light." Happily before long this "violet scintilla grew to be a definite flame of light," and she was soon as well as ever. It was no doubt from her eyes that her granddaughter Miranda derived "those lambent electric eyes, colour of onyx," which worked such mischief on the heart of her cousin, Sir Harold Tachbrook, Baronet. When the doctor saw the violet scintilla he ordered for the patient with great promptitude "a red mullet and a glass of sherry, with a chop and a glass of stout to follow as quickly as possible." Whether the red mullet had some mysterious connexion with the violet scintilla, and how, if it had, it was at once provided in a country house, we are not told. With natural magnetism, however, much may be done. The lady of the violet scintilla is soon killed off, leaving a son Harold, not of course Sir Harold. He is soon brought to man's estate, and is told by his dead mother in a dream "to marry Edith Ockit, and to go to Australia within a year." His father at once gives his consent to both courses, saying, "I should once have said that such dreams were mere reflections of what you thought during the day. But I have seen so many curious experiments that I cannot reach a conclusion." So hero and heroine number two set off for Melbourne round the Cape of Good Hope. They get driven out of their course, and are becalmed off Borneo. Why Borneo we are not told. Perhaps Mr. Collins thinks it necessary to get becalmed off somewhere, and Borneo may be the nearest place to Melbourne of which he happens to have heard. However, be that as it may, the third heroine, Miranda, is born, and her mother, the second heroine, Edith, dies off Borneo. On her death-bed she entreats her husband on his return to England to seek out her old schoolfellow, one Mary Fane, who, from the full description of her, promises to be another heroine. Years later he obeys his wife's request, and finds that, though Mary is dead, she has left a daughter for him to marry. By this time the reader has become so weary of this long line of heroines that he cries out:—

Why do you show me this? A fourth! Start, eyes!
What, will the line stretch out to the crack of doom?
Another yet! A seventh! I'll see no more.

The spirit of Harold's mother had, with much consideration, smoothed matters for him, left as he was with an infant daughter; for she "had in a vision of the night mapped Melbourne before his eyes, and had pointed to a place in that map as if ordering him to go thither." He obeyed her, and found a good woman who for the next eighteen years or so brought up Miranda. Chance led him one day to the docks, where he saw a boy of about fourteen jump ashore. The boy had run away from home, and, like all runaway boys, had a roll of bank-notes in his pocket. He marries Miranda when they are old enough, and, as is only natural, turns out to be Sir Harold Tachbrook. The two Harolds live together for a good many years, and the elder of the two not only makes a great deal of money by sheep-farming, but also buys a piece of land for 50*l*. and sells it for 30,000*l*. They return to Europe in a great steamship, and in a chapter entitled "Torricelli's Tube"—barometer, though a word of undoubted Greek origin, has doubtless become too common for Mr. Collins—see a good many remarkable occurrences. The captain consults his Torricelli's tube, and, though the weather was calm, "started suddenly back. It had fallen since morning from 30·7 inches to 29·3." He had all sail taken in at once. The precaution was happily in time, so far as the sails were concerned, as the storm did not break till nearly thirty hours afterwards. Meanwhile, by way of prudent precaution, he had communicated his fears to some of the passengers. At the same time a talismanic "crystal icosahedron," by turning first jet black and then white, had scared the ladies. At last the storm burst; "the wind yelled at the sea, and the sea howled like a scourged slave," but in a few moments "the passionate wind soon forgets its rage, and gives zephyr kisses to the sea." Meanwhile the ship had been driven on to an island "between two lofty ridges of basaltic rock." The Tachbrooks land and find a "Troglodyte," who at once introduces himself as Gilbert Tachbrook, the heir to the baronetcy. He soon acknowledges the younger Harold's superior claims, and proposes that they should all return together to England. A second great gale meanwhile had arisen, and the steamship had disappeared. It had happily a captain who was "an experienced navigator," and moreover it had been built of "teak and iron," so that, though it had been "driven fiercely

into a *via (sic)* by the wind-driven hammer of the wave," it had quietly floated off, and "accomplished the voyage to Liverpool without difficulty." The Tachbrooks are left on the island for months, till at last a passing steamer notices the signal they make, and puts in towards the land. They are not allowed to escape, however, so easily, for a squall upsets their boat. All are got in safety on to the steamer except the younger Harold. But as he is the claimant to a baronetcy, and is engaged to one of the seven heroines, he has no need to fear drowning. He had, to be sure, been caught in the paddle-wheel, but he had got clear of it, and had swum about till he was nearly sinking, and "was striking out fiercely in despair" when he is picked up by another ship. In it he finds another hero, Viscount Tixover, who has, on his return to Europe, to be provided in his turn with a heroine. This nobleman has quite as much magnetism about him as the descendant of the late lamented Sobieska. If only he were a little more orthodox, he would be a character of whom Mr. Henry Kingsley might be jealous. He had all the qualities of a muscular Christian, except perchance the Christianity. He could swim magnificently, eat enormously, "punch" any one's head, play at billiards with the best, and perform all those other great exploits which we have been taught to revere. With him begin a fresh set of adventures still more absurd and improbable than those which had gone before. Every chapter sees a new character dragged in, who however differs from his predecessors about as much as the last soldier in a stage army differs from the first. We have O. O., a great traveller, in whom the author delights, and who boasts of having "flogged a whole tribe of niggers from the chief downwards—men, women, and children."

We have scarcely any patience left for the heroines whom we have not as yet described. There is Myfanwy Owm, who was the orphan and neglected daughter of Camdoc Owm, "a bard and also a gentleman," who is raised from a waiting-maid into a heroine and the future bride of General Thurston's son. There is Margaret, who had been cruelly treated in her youth, but who marries Gilbert Tachbrook; and there is Seroza, who is found dumb on the Troglodyte's wonderful island, where she had escaped murder by shooting her would-be murderer, her stepfather, with his own pistol, and who turns out to be the long-sought-for daughter of Mary Fane. And for all that we can remember there may be half-a-dozen heroines besides. There is some attempt to relieve all these exciting adventures by a little light talk. But we will not inflict a specimen of this on our readers. By this time they will have had enough of Mr. Mortimer Collins's "Midsummer Madness," whether there is method in it or not.

POLITICS FOR POOR PILGRIMS.*

THE *Einsiedler Kalender* is always the first to appear of those numerous pictorial almanacs in quarto size which one sees in every bookseller's window in Switzerland and Southern Germany in late autumn and early winter. It is usually ready by the end of August, in time to be bought by the immense crowds of pilgrims who flock to Maria-Einsiedeln for the festival of the miraculous *Engelweih*. Many of these obtain it on their route; others take it home with them to study in their different countries. Einsiedeln has not only been for years one of the three most thronged resorts of pilgrims in Roman Catholic Christendom, but it will probably remain, in spite of all the recent attractions elsewhere, the favourite goal of the mass of German-speaking pilgrims. Switzerland, Elsass, and Lothringen, the Black Forest, Bavaria, Wurtemberg, and Austria, pour in their thousands annually; they arrive by dribbles at ordinary times, but at the September feast of the Consecration of the Angels they come in such numbers that all the roofs in Einsiedeln are insufficient to cover them. Two years ago all the stables, kitchens, and sheds in the town and its neighbourhood were required for the pilgrims, and hundreds were spending the whole night in the church; in one inn alone there were eighty-five French priests, most of whom, if not all, were pastors of German-speaking flocks in the conquered provinces. Pilgrims of the upper and middle classes, such as visit Paray-le-Monial and Lourdes, do not find their way in any number to Einsiedeln. We do not know whether the year of pilgrimage will send a larger detachment of the wealthy; of late years they have only visited Einsiedeln by proxy, and throughout the summer and autumn months one may see miserable specimens of their cheap proxies in the half-clad women with little bundles who huddle together in the fore part of the steamboats on the Lake of Zurich. The Black Virgin of St. Meinrad is sure of a very large concourse of the usual class this year, not merely on account of the special impulse given to pilgrimages, but because the *Engelweih* falls upon a Sunday. A programme of the doings on the eve, the festival Sunday, and its octave is attached as a fly-leaf to the *Kalender*, and it is there stated that the "*Engelweih*" of 1873 will be celebrated "*auf besonders feierliche Weise*." Editors of Catholic newspapers are requested to give full notices of the hours of the masses, festival sermons, cannon-shootings, bell-rings, processions; and to state that each of the Sundays will close with music in the Platz and "*sinnreicher Illumination*." The whole announcement is suggestive of a pious and wildly merry day at the Crystal Palace.

The principal interest of the *Einsiedler Kalender* comes from the fact that it is composed for the use of those thousands of the

* *Einsiedler Kalender für das Jahr 1874. XXXIV. Jahrgang.*

poorest classes from all German-speaking nations who find their way to Einsiedeln for a bodily or spiritual cure. Traditions of wonderful healings are handed down in Swiss and Elsasser families; unbelievers suggest that it is not very wonderful that a week's journeying in the open air, perhaps from the hot flats of Elsass, including a strenuous climb and a sojourn of two or three days at an elevation of three thousand feet above the sea, with copious drinkings of the most splendid water, should effect both bodily and mental ameliorations. The unbelievers cannot, however, account so readily for the improvement of soil and of crops which is said to result so frequently from a visit of their proprietor to the Black Madonna. But although the pilgrims find their way to Einsiedeln with the purpose of getting enjoyment, or bodily, spiritual, and worldly prosperity, out of the pilgrimage, the "Kalendermacher" (as the editor always calls himself) thinks they come for something more. He sees those needs of theirs of which they are not themselves actively conscious. They stand in want of political and ecclesiastical instruction; and in his *Kalender* he gives excitable persons of many nations directions as to the real aims and purposes of their civil governors, and of the wicked Old Catholic pastors and communities who will try to draw them into perdition. On the religious benefits of the pilgrimage the Kalendermacher has not a word to say, although he declares that he is determined to make the *Kalender* "vor Allem religiös und ein bisschen politisch." He is new to his work; the genial Father Gall, who instituted the *Kalender*, and has edited it for the past thirty-three years, having died during the present year; the number for 1874 has a monoir and an excellent portrait of the "blessed Kalendermann." His successor apologizes for calling Father Gall a scholar; scholarship in a priest has come to be suspected by pious and simple Catholics since so many priestly scholars have become Old Catholics or shown Old Catholic sympathies:—

Oho, was habe ich gesagt! Mir ist als sehe ich viele meiner Leser schief Gesicht schneiden und hüre sie sagen, So! also war P. Gall ein Gelehrter! Der Kalendermann war auch so ein Gelehrter mit einem Buch unter dem Arm und eine Brille auf der Nase! Und dann denken sie gar noch an das alte Sprichwort, Je gelehrter, desto verkehrter!

Contrasts between the happiness of the pious ignorant and the wretchedness of the unbelieving learned appear at intervals under different headings in other parts of the number. In a paper on "Summer in the Life of Nature and in the Life of the Church" there is a sketch of our own unhappy countrymen on tour. We go up to the top of the mountains in the company of rich Americans and Frenchmen, "with our red book." We leave our palaces and golden houses which we so jealously shut against the poor, but as we come up the mountain-side we find the poor goatherd or the Semmering hospitably open his or her door to us. When we look on the white mountain-peaks, the blue lakes, the grand waterfalls, and the far-reaching view, we only know that it is all idyllic and romantic because our red book tells us it is; but the great majority do not feel that it is. The poor goatherd does not know what these grand words mean:—"Der Geisshirt aber mit seinem unverdorbenen Herzen fühlt die Schönheit dieser Wunder der Schöpfung."

We cannot help thinking that the printer must have slyly misplaced the adjectives in the editor's engagement that the *Kalender* shall be "before everything religious and in a slight degree political." Articles which begin religiously manage to end politically. The article on "Summer in Nature and in the Church," from which we have just quoted, closes with a column of grape-shot at the Old Catholics. In nature and in the Church we see everywhere external and material splendour; the Church, which has a winter in her Lent and Good Friday, has a gorgeous summer in her Pentecost, when the Holy Ghost descended upon the heads "der göttlichen Jungfrau und der Apostel," and in her Corpus Christi. The Kalendermacher holds this "für einen der festen und unumstößlichen Beweise, dass unsere Kirche die wahre Kirche Gottes ist." The Old Catholics are blind to this "best and most irrefragable proof that the Pope's Church is the true Church of God." Perhaps they think that it would have served Jupiter's Church equally well as an argument against St. Peter's Church. They tell us, he says, that we must worship God in spirit—"These spiritual worshippers of ours are nothing but unconverted Pharisees, who turn the inside outwards, as one turns a glove. They want to appear righteous on the outside, while our people wish to hide a real righteousness inside them." This dexterous turning of the tables upon the Old Catholic will easily pass for an argument with the peasant who has hung up a waxen figure of his own heart, or his wife's rheumatic leg, or his child's broken arm before the Black Virgin.

The comparison of the Old Catholics with the Jews is a favourite one with the new Kalendermacher. No comparison could have been more awkwardly chosen; every one who has mixed in South German or Swiss society will recollect the intolerant dislike with which Jews are regarded, even by those who are better educated than the buyers of the *Einsiedler Kalender*. These two classes of unbelievers and persecutors of the Church are linked together both in its pictures and its literature. There is an account of the conversion of a "portier" of one of the largest hotels in Switzerland from Protestantism to New Catholicism by the simple study of the New Testament. He read his Bible (possibly given to him by some Evangelical tourist who intended it to lead to a very different result) until he became so uncomfortable that he was compelled to send for a Catholic priest and ask to be received into the Church. The priest asked him what made him prefer the Catholic Church

to the Protestant, in which he had been brought up. "Well," said he, "in my New Testament I see that the true disciples of Christ were always persecuted on account of their doctrine. I look up and down the world to see what persons exhibit this mark of true discipleship in our time; where I find that sign I know that I shall find the true Church. Now, are the Jews persecuted? No. Are the Old Catholics? No. Are the Freemasons? No. Are the Catholic priests and religious orders, the bishops, and the Pope? Yes. I have therefore found the true disciples of Christ and His true Church." The priest acknowledged that the man had clearly perceived "das neue Kennzeichen der wahren Kirche," instructed him in all Catholic truth, and baptized him.

A more laboured and ingenious demonstration of the unity of spirit between Judaism and Old Catholicism is offered to the peasants of many lands in an article of several pages under the title "Die Zerstörung Jerusalems und etwas vom Altkatholizismus." The article is professedly a sermon upon a woodcut of one of the episodes of Kaulbach's great picture of the "Destruction of Jerusalem," the group in which the painter has represented, half really and half symbolically, the flight of Christendom out of the midst of the doomed city of Judaism. A Christian family is escaping in peace and without hurry, carrying palm-branches and the holy books, which the elders read as they journey; three Jewish children kneel on the road-side entreating to be taken with the Church from the wrath to come; three angels sweep overhead, bearing the sacramental chalice and host. There is something like spoiling the Egyptians in making Kaulbach do duty for the Ultramontanes, who have held him and his work in such abhorrence since his picture of the Reformation epoch. The sermon on this woodcut is a specimen of the most reckless rationalizing; but as rationalism can be called by the innocent title of mysticism when it is used in the service of the Pope, the Kalendermacher's sermon will no doubt escape the condemnation which it would get if it had a less pious intention. The picture reminds us that there are two Jerusalems—one which God hates and will destroy, and the other, the true Jerusalem, which He delivers out of the midst of Jerusalem the damned. Kaulbach has given us a picture of the true Jerusalem in the act of its exodus. The true Jerusalem consists of the Pope and all the Catholic bishops, priests, and people who hold fast to him. The false and condemned Jerusalem consists, of course, of the Old Catholics. But here the parallel limps; for it would be absurd to tell the most ignorant peasant or professional beggar from the valleys that the Pope and Cardinals are engaged at this crisis of Church history in taking their flight out of the bosom of Old Catholicism. The brief which the Kalendermacher holds requires that he should show that in our day the false Jerusalem is taking its flight out of the midst of the true Jerusalem, and that in our day God is about to destroy those who flee to the mountains and not those who abide in the city. This is singularly awkward; so he is obliged to shift the figures and rationalize in a more promising direction. The true Jerusalem is but another name for Christendom, and Christendom means the entire Catholic faith, including its very latest definitions. Every true Catholic has this true Jerusalem in his own soul. When Old Catholicism enters into a Christian soul, the judgment of God visits it, and the true Christendom therefore takes its flight out of that soul; the angelic presence, the Sacraments, true doctrine, and Christian peace leave it, just as we see in the picture. In the midst of this quaint and impudent exposition the writer inserts a parenthetical advertisement of the book from which the woodcut is borrowed. But he is by no means exhausted by his two efforts at identifying Old Catholicism with Jerusalem the damned. He appeals next to history. Any person who has read the history of the year 70 A.D. in Eusebius will be astonished at its "viel Ähnlichkeit mit dem jetzigen Jahr 1874"—a slightly presumptuous anticipation of the character of a year as yet unborn. As in the year 70 the heavenly Jerusalem of God's faithful was surrounded by bitter enemies in the material Jerusalem, so in the year 1874 is God's heavenly Jerusalem in every soul and parish and in all Christendom surrounded by the wicked and by persecutors:—

The bitterest of all the enemies of the true Christendom in our day, and in our lands [says the Kalendermacher] are the so-called Old Catholics. Who then are these Old Catholics? They are those who refuse to believe and acknowledge the new dogma ("das neue Dogma") of the Papal infallibility in faith and morals. But, dear reader, this matter requires a closer explanation, and so I will tell you who belong to this people. To them belong all those who reckon themselves wiser than the Pope, than all the bishops, and than all the learned doctors and believers who hold this new dogma. To them belong all who think that God allows men to reject or acknowledge this truth just as they please. To them belong the proud and conceited, haughty professors, haughty officials, haughty lawyers, haughty schoolmasters and teachers, haughty dilettantes (Dummköpfe). These last are the most numerous, for I tell you that amongst all these haughty ones scarce one in a hundred knows what the dogma of Papal infallibility means. But the worst class of all the haughty ones is made up of haughty clergymen. Now mark this, dear reader, the haughty Old Catholics are nearly all Old Catholics out of deliberate plan and intention; they hide something behind their Old Catholicism. It is ambition. They are ambitious to rule, ambitious to get money, ambitious to be thought important, or ambitious for a wife; for among all these haughty Old Catholic clergymen you will scarcely find one who is not longing for a wife.

But the haughty, he says (die Hochmüthigen) form only one class of the old Catholics. There is another class who call themselves "die Aufgeklärten." They wish to have two dozen articles of faith less instead of one article of faith more. They dislike praying, fasting, and the confessional; they wish to reduce the outward ceremonies and worship God in spirit, but not in truth.

They are, in fact, no Catholics at all. The name Old Catholic just suits them; for as we call a man an old church beadle who was once a church beadle but is no longer one, and call another an old councillor because he was a councillor some years ago, so we call them old Catholics because they were once Catholics. "Schöne Altkatholiken das: geschneigte Herren und Gerngrosse!"

These two sections of Old Catholics have a bond of union in their hatred to the Catholic Church, the Pope, the bishops, and all the faithful Catholic people. They hide their real plan under a number of catchwords, such as "Neuerung in der Kirche, Abfall von der Kirche, Staatsgefährlichkeit des Glaubenssatzes!" At the destruction of Jerusalem there were just such parties in the doomed city. At the head of one stood the wicked old priest Eleazar, who had refused to receive the new dogma of Christ's kingdom; the pilgrims are evidently meant to see in him the Döllinger of the year 70, and in the great theologian the Eleazar of the year 1873. At the head of the other party stood the haughty "ajtjüdische" John of Giscala, the sly and powerful politician, in fact the Bismarck (as the Elsassers are to understand) of the year 70. The parallel is so drawn out that few can err in the interpretation. The Kalendermacher refuses to give the names of the moderns, quoting the Latin proverb in excuse:—"Nomina sunt odiosa," sagt der Lateiner, man hört die Namen nicht gern; du aber, lieber Leser, schreib sie an den Rand des Kalenders." In a quarter of a century "this Eleazar, the Old Catholic clergyman, and this John of Giscala, the crafty political manager, will be forgotten men." The great business of the pilgrims is to refrain from dealings with them or their dupes. They must remember that

No men are Catholics, though they do not alter one letter or syllable of the Catholic articles of faith, unless they add the article of the Pope's infallibility. Every ministerial act done by these Old Catholic clergymen is either *gottesräuberisch* oder *ungültig*, oder *beides zugleich*. Their masses are indeed masses, because they are and remain priests, but they commit sacrilege every time they celebrate mass. Every absolution they impart in the confessional or on the death-bed is a robbery of God, and of no profit to the receiver. Every Catholic who goes an Old Catholic clergyman for his soul's pastor makes himself a fellow-criminal. Most terrible is it when a whole congregation has such a pastor; far better would it be to have no pastor at all.

In the professedly political article of the *Kalender* the editor has taken his oversight of all the Christian nations through the eyes of Hans Guckensland. Herr G. is supposed to be an inquiring layman, and to relate what he has seen in Germany, Austria, France, and England with marvellous freedom from prejudice. We need hardly say that he is one of those laymen who are known in every Continental nation as clericals. Herr G. begins with Germany and ends with Switzerland; nowhere does he find the situation of the Church hopeless, while in France, England, and America it is more hopeful than it has been for centuries. He is afraid that Germany is becoming more Prussian than German, but is glad to see that Prussia cannot set Old Catholicism firmly upon its legs. Austria is governed entirely by the Jews; she is suffering from the loss of one of her greatest bishops, Dr. Fessler of St. Pölten, of whom Herr G. gives a life and portrait. The late bishop did the Catholic Church a service beyond all price by writing that unanswerable treatise on Papal infallibility with which the Holy Father declared himself to be completely satisfied:—"Er stellt darin den Glaubenssatz so klar, so bindig, so einfach und natürlich dar, dass sich der Leser am Ende fragt, wie es Leute geben kann, welche meinen, der Glaubenssatz von der päpstlichen Unfehlbarkeit bringe der Kirche und dem Staat Gefahr." Spain is likely to be happy, for "Don Carlos has promised to relay the foundations of faith and morality, right and justice, and he wins land and credit day by day." There is much that is foul in France, but it is overbalanced by the good. The repeated appearances of the Holy Virgin "als die unbefleckt Geborne" to a poor French girl in 1858 have given new life to France, and the life is showing itself in gigantic pilgrimages and innumerable conversions. Italy has destroyed her hopes with her last convent. "Poor characterless Victor Emmanuel is trembling with fear and anguish because he knows not at what moment the Revolution will devour him." Over Switzerland the writer becomes melancholy; he sees so many churches deserted by sacrilegious worship. The Swiss leaders and governors "only take the name of Old Catholicism upon their movement in order to be able to bring the Church and Christendom to destruction so much the sooner." He speaks more charitably of us than of his own fatherland. He has been marvellously inspired by catching a glimpse of our Father Ignatius. In other lands he sees great exhibitions, political changes, scientific inventions:—

But the one markworthy thing in England is the rapid extension of the Catholic Church. One hundred and seventy years ago a reward of 2,500 francs was offered for the discovery of a Catholic clergyman, and now there are twenty bishops and 1,844 priests. . . . To the Jesuits the very freest activity is allowed. The Benedictines are most numerous and most beloved (Einsiedeln is Benedictine); they first brought the faith, science, order, and civilization into England. They possess five monasteries, fifty mission stations, five institutions for the higher education. Among the bishops are four Benedictines. Their reputation is so great, that a few years ago even a Protestant pastor gathered disciples around him and endeavoured to found a Protestant Benedictine monastery. Marvellous! On the Continent we hear day after day the assertion, Convents have outlived themselves, they are unsuited to our age! And the English, whose sense for practicality is famed throughout the world, are now introducing them again on all sides as the most useful of institutions.

AFTERMATH.

ALL readers of poetry must feel pleasure when Mr. Longfellow adds a new volume to his former works; the only thing we are inclined to quarrel with is the title, *Aftermath*. Mr. Longfellow is but a year or two older than our Laureate, and we in England have not yet lost the hope of seeing the author of *Guinevere* and *In Memoriam*, perhaps after a certain time given to repose, to the re-adjustment and final concentration of his great faculties, once more "spring upwards like a pyramid of fire," and outshine all his former achievements. Both Mr. Tennyson and Mr. Longfellow must be included, we think, in the same class of singers—the men, we mean, of culture and thought; men with a power of self-measurement and self-criticism that enables them, if not, like Dryden, to go on improving, at least, like Milton and others, to retain their vigour and hold their ground firmly throughout a long career. They are, in a word, artist-poets, and not bard-poets. The bard, such as Shelley—we will add, in spite of all his faults, such as Swinburne—belongs to another type and subdivision of the poetic brotherhood. He is not necessarily greater; perhaps, in the number and organization of his faculties he is often less; but he differs. He is more nearly the man of whom Plato was thinking when he said *αὐτὸν μάλιστα οὐδὲν ποιητής*, he is more spontaneously and irrepressibly a poet. He is, on the other hand, we believe, less likely, when his youthful imagination flags a little, to fall back on meditative feeling and the resources of art, thus acquiring for it new strength and energy. Imaginative writers, if they lose nothing else as time goes on, must lose the glow and fire of youth—the mere animal fire, if you will, but even that, unless replaced by mental powers that ripen and develop themselves through serious thought, and sustained efforts in the pursuit of truth or the study of human life, is a loss to be felt and regretted. Now the bard we think less likely to recover himself after this first exhaustion and to go on growing than the artist. We have not space enough at our disposal to discuss the question here, but the grounds of our belief, as it seems to us, are obvious enough. If this be so, Mr. Longfellow, emphatically an artist-poet, and not a bard, has many fruitful years, we trust, before him; many crops of flagrant clover and flourishing lucerne to garner in, of which the seeds are now working secretly underground.

Taking this volume, however, just as we find it, we like nothing better than the short lyric at the end entitled, like the book itself, "Aftermath." It is full of pensive beauty, and seems as if it had been written in a time of falling leaves to the wailings of some autumnal wind. Before quoting it, we would remark that the technical term "rowen," a term new to us, appears to be a good old English word preserved, like many other good old English words, in America, though forgotten here; it means the rough grass, &c., whilst still on the ground, which makes up the aftermath when it is cut:—

When the Summer fields are mown,
When the birds are fledged and flown,
And the dry leaves strew the path;
With the falling of the snow,
With the cawing of the crow,
Once again the fields we mow
And gather in the aftermath.

Not the sweet, new grass with flowers
Is this harvesting of ours;
Not the upland clover bloom;
But the rowen mixed with weeds,
Tangled tufts from marsh and meads,
Where the poppy drops its seeds
In the silence and the gloom.

With regard to this new series of tales, taken by themselves, we do not know that they will increase Mr. Longfellow's poetical reputation. They are altogether slight, without either much body or very exquisite flavour, resembling rather good clean St. Julien, skilfully made and carefully bottled, than poetical Chateau Margaux or Lafitte; but there is nothing in them to show that Mr. Longfellow's right hand has lost its cunning, that his eye has grown dim, or his natural force abated. The interlocutors are the same men as before; but one merit this volume has, and in this respect it stands higher than its predecessors—that is, the skilful juxtaposition by which the tales are made to relieve each other. The colouring of the whole is so judiciously arranged and harmonized that we pass on from one legend to another more smoothly and pleasantly than heretofore. The main defect of the book, after its general slightness and want of bone, is, we think, that the majority of the stories are very old, very well known, and have been related again and again. For instance, the "Jew's Tale, or the Angel Azrael" is the ancient fable that Solomon sends off a terrified suppliant to the furthest end of India in order that he may escape impending doom, and, as may be expected, sends him in vain. This fable has been versified at least as effectively as in the pages before us. We cannot at this moment recollect whether it was so versified by Charles Tennyson Turner, or the lamented Arthur Hallam, or Archbishop Trench, but we do recollect the general purport, and the last two lines in particular. Solomon bends down in reverential awe before the dreaded messenger Azrael, meeting thus the stern question, "How comes it that this man is in Jerusalem, destined as he is to die at this very moment in the extremest distance of India?"—

Angel of Death, the King replied,
Thou'lt surely find him there.

We like this conception of Solomon's behaviour in the presence of death better than that of Mr. Longfellow:—

And as they walked the guest became aware
Of a white figure in the twilight air,
Gazing intent, as one who with surprise
His form and features seemed to recognize;
And in a whisper to the king he said:
"What is yon shape, that, pallid as the dead,
Is watching me, as if he sought to trace
In the dim light the features of my face?"
The king looked, and replied: "I know him well;
It is the Angel men call Azrael,
'Tis the Death Angel; what hast thou to fear?"

The magnificent Jew, rejoicing in the pomp and splendour of a life unparalleled upon earth, was no more likely than his guest to be on careless and comfortable terms with Azrael. It is more to our taste also that Azrael's own question should be seriously put than in the half-jesting tone adopted by Mr. Longfellow:—

Then said the Angel, smiling, "If this man
Be Rajah Runjeet-Sing of Hindostan,
Thou hast done well in listening to his prayer;
I was upon my way to seek him there."

The "Mother's Ghost," again, has been made perfectly familiar to us by a very powerful poem of Mr. Robert Buchanan's. The form of the legend, as given by the two writers, varies a little; but Mr. Buchanan's version of it is the more interesting and impressive of the two. On the other hand, worn threadbare as the names of Emma and Eginhard have been by endless repetitions, we have never seen their story so charmingly told as it is here told by Mr. Longfellow. We quote the conclusion:—

Then Eginhard was summoned to the hall,
And entered, and in presence of them all,
The Emperor said: "My son, for thou to me
Hast been a son, and evermore shalt be
Long hast thou served thy sovereign, and thy zeal
Pleads to me with importunate appeal,
While I have been forgetful to requite
Thy service and affection as was right.
But now the hour is come, when I, thy Lord,
Will crown thy love with such supreme reward,
A gift so precious kings have striven in vain
To win it from the hands of Charlemagne."
Then sprang the portals of the chamber wide
And Princess Emma entered, in the pride
Of birth and beauty, that in part o'ercame
The conscious terror and the blush of shame.
And the good Emperor rose up from his throne,
And taking her white hand within his own
Placed it in Eginhard's, and said: "My son,
'Tis the gift thy constant zeal hath won:
Thus I repay the royal debt I owe,
And cover up the footprints in the snow."

All these compositions, moreover, even when not particularly original, are marked by Mr. Longfellow's fine taste and easy grace of expression. Having said this, here we might end, but that the word "Aftermath," though, we trust, used prematurely, suggests to us that we should cast a glance backwards, and compare what Mr. Longfellow is now offering to us with what he has already given to the world. Mr. Longfellow, though not one of the very productive and voluminous poets, has nevertheless in all these years accomplished a great deal. Many of his lyrics, such as the "Psalm of Life," the "Old Clock on the Stairs," the "Norman Baron," "Excelsior," and others, are of generally acknowledged excellence. The "Golden Legend," if we can put aside backward reminiscences of *Faust*, is a dramatic poem of much beauty and sweetness; but, as far as those compositions are concerned, Mr. Longfellow, though a considerable English poet, is an English poet and no more. As a poet at once American and English he means to rest his fame, we presume, upon the story of *Hiawatha* and *Evangeline*. As for *Hiawatha*, the mythology is so grotesque, the incidents so absolutely without human interest, the monotonous trochaic measure so tiresome in the long run, that we cannot pronounce it a success. It is possible that in America a better knowledge of the places referred to, a livelier sense of the associations involved, may recommend it to Mr. Longfellow's countrymen, but it says little to us. With regard to *Evangeline*, however, the case is altogether different; it is, and this no doubt is its chief merit, a genuine American poem; but it is also a poem of a high order for England and the rest of the world. The first book is full of real idyllic beauty and masculine pathos—a pathos both true and deep—and the conduct of the story afterwards is not unworthy of that first book. In the interest of such a poem it is indeed unfortunate that the classical hexameter cannot be turned into an English measure. We think that Mr. Longfellow's instincts were right when he endeavoured to frame the poem of a new people and a fresh inspiration in a metre of its own—a metre that, without any violent or ostentatious separation, should remove it, as far as possible, from the commoner aspects of poetry in the old country; but, alas! he cannot any more than others manage the unmanageable, and *Evangeline* must continue to charm the lovers of poetry as it has hitherto charmed them, in spite of its being a pain and a trouble to read any of its beautiful passages aloud. Notwithstanding the ominous heading to this present book, we trust that *Evangeline* may not be the last national poem for which the world will have to thank Mr. Longfellow.

TAYLOR'S SOUND AND MUSIC.*

MR. TAYLOR has rendered an opportune service to English readers by conveying to them in a permanent and readable form Professor Helmholtz's valuable additions to the physical theory of music. Of these discoveries of the great German physicist Mr. Taylor considers it not too much to say that they do "for Acoustics what the *Principia* of Newton did for Astronomy." While completely upsetting the old theory of musical harmony, and throwing a new light on the physical meaning of musical quality or *timbre*, they reach back by implication into the fundamental laws of all sound. Professor Tyndall did something in his well-known Lectures on Sound to place a part of this doctrine before English students. Only, not being primarily concerned, like the German *savant*, with reconstructing the physical basis of music, he reproduces it in a slightly parenthetical and disconnected shape. Mr. Taylor has confessedly in view the explanation of musical effects, and his work follows very closely the great treatise of Helmholtz.

The new doctrine published by Helmholtz in *Die Lehre von den Tonempfindungen*, and popularly sketched out in his lecture *Ueber die physiologischen Ursachen der musikalischen Harmonie*, has not perhaps become very familiar to a large section of English readers. A brief but clear account of its principal features appeared in the *Fortnightly Review* for April 1872. But, so far as we are aware, no complete and reasoned statement of the German theory has been given us before the publication of Mr. Taylor's work. To those unacquainted with the main propositions of Helmholtz's theory, it may perhaps be well to state them at once, before considering Mr. Taylor's version of them. Up to the time of Helmholtz's researches little or nothing had been done to explain the quality or *timbre* of musical sounds. It had long been known that the pitch of a note is determined by the number of vibrations per second in the sounding body and the atmospheric medium. And the strength or intensity of a tone was rightly referred to the extent of oscillation in the agitated molecules of the air. With respect to the physical grounds of harmony, it had been discovered that, whenever two notes make a concord, there exists a simple numerical ratio between the numbers of their vibrations; and it was long concluded that such a relation supplied an adequate explanation of the pleasurable sense of harmony, it being forgotten that the mind of the hearer is never aware of any such numerical proportion. The first great service of Helmholtz was the analysis of the third variable in musical notes—namely, quality—into a series of partial tones. What goes as a simple elementary musical tone is in reality a composite tone or clang made up of a fundamental tone and certain upper tones, which are due to the simultaneous series of vibrations of different lengths that arise when a string or wire is made to oscillate. It is the number and strength of these upper tones which give the peculiar rich *timbre* to the notes of certain instruments, pre-eminently the human voice. On the other hand, where these are wanting, as in the notes of a tuning-fork or a stopped organ-pipe, the notes appear thin and poor. From the doctrine of the composition of single musical tones is deducible, with the help of known physical laws, the Professor's theory of harmony. It appears that when two sets of undulations of nearly the same length travel to the ear, their several phases tend now to strengthen, now to neutralize one another. The effect of this on the ear, when the alternations in the wave force are sufficiently slow, is, instead of an even flow of tone, a series of pulsations or shocks (*Tonstösse*). When they become exceedingly rapid, these beats are no longer distinguishable, and then we have the peculiar shrill jarring of dissonance. Now, according to Helmholtz, every case of discordant notes may be explained by help of these beats when once the composite character of our ordinary musical clangs is distinctly recognized. For it may be seen in every instance of two discordant tones that either between the fundamental tones themselves, or between their respective upper tones, some such effect of beat as we have described is produced. From this view it follows that the physical reason of harmony is simply a negative one. Any two or more simultaneous notes will produce a pleasing effect on the ear, provided there are no conflicting beat-favouring elements; and the reason why harmonic intervals always correspond to a simple numerical ratio is that this ratio happens to supply the only cases of non-conflicting upper tones.

Mr. Taylor's volume professes to add little to the excellent exposition of Helmholtz himself. Yet in point of style and mode of illustration our author may well lay claim to independent workmanship. No doubt he had in the German Professor not only a perfect master of his subject, but also a singularly clear and impressive exponent of science. But unfortunately there are too many examples of the facility with which a confused understanding may darken what another mind has rendered luminous, and we cannot but set at a high value the perfect grasp of subject which Mr. Taylor everywhere exhibits.

The author, it will be seen, avowedly writes for non-mathematical readers, and he has wisely kept this purpose in view in selecting both material and manner of illustration. A good part of the well-known facts and laws of sound, which are all presupposed in the explanation of musical phenomena, are very clearly stated. By the help of diagrams, some borrowed from previous writers,

* *Sound and Music. A Non-Mathematical Treatise on the Physical Constitution of Musical Sounds and Harmony, including the Chief Acoustical Discoveries of Professor Helmholtz.* By Seeley Taylor, M.A., late Fellow of Trinity College, Cambridge. London: Macmillan & Co. 1873.

and others original, Mr. Taylor succeeds, we think, in showing that a great number of acoustical facts are susceptible of interpretation quite apart from mathematical formulæ. Thus the nature of a wave as conceived in physical science is very simply defined, and the precise mode in which sound waves are propagated is rendered as intelligible, we suppose, as the nature of the phenomenon admits. Besides loudness and pitch, the phenomena of resonance receive ample discussion. It is known that when a tuning-fork is made to vibrate, another fork of precisely the same pitch, if held in close proximity, will be affected by the agitated air medium, and will sensibly respond to the first. So the column of air in a tube or box of certain shape and volume may be made to resound when contiguous to a vibrating tongue or string of certain length. Professor Helmholtz has made use of this fact in his instrument called the resonator, by means of which the presence of any partial tone in a given clang may be detected through the sympathetic movement of the air contained in a hollow brass globe corresponding in volume to the pitch of the particular tone. After explaining this interesting fact, Mr. Taylor gives us a full account of the mechanism of the principal musical instruments, and illustrates in a very happy manner the intricate phenomena of vibration of the air column, integral and segmental, in closed and open pipes. Other parts of the subject skilfully handled by our author are the interference of sound and beats, the meaning of pure intonation, and the somewhat unsatisfactory device of temperament. In all parts of this exposition Mr. Taylor shows that he has not only something of the firm grasp and the analytic skill of our best scientific writers, but also a touch of their scientific ardour. As a sample of a pleasantly graphic, and at the same time highly instructive, description, not unworthy perhaps of Professor Huxley or M. Taine, we may quote the following (pp. 7 and 8):—

An observer who looks down upon the sea from a moderate elevation on a day when the wind, after blowing strongly, has suddenly dropped, sees long lines of waves advancing towards the shore at a uniform pace and at equal distances from each other. The effect, to the eye, is that of a vast army marching up in column, or of a ploughed field moving along horizontally in a direction perpendicular to the lines of its ridges and hollows. The actual motion of the water is, however, very different from its apparent motion, as may be ascertained by noticing the behaviour of a cork, or other body, floating on the surface of the sea, and therefore sharing its movement. Instead of steadily advancing, like the waves, the cork merely performs a heaving motion as the successive waves reach it, alternately riding over their crests and sinking into their troughs, as if anchored in the position it happens to occupy. Hence, while the waves travel steadily forward horizontally, the drops of water composing them are in a state of swaying-to-and-fro motion, each separate drop rising and falling in a vertical straight line, but having no horizontal motion whatever.

Other examples of precise statement and luminous explanation may be found in the definition of a physical wave (pp. 25-26); in the representation, by means of a diagram, of the invisible motion of vibrating molecules in symbols of visible motion (p. 29); in the account of the complex phenomena of resultant wave-forms (p. 142, seq.), and elsewhere. As an instance of a familiar fact happily invested with an unsuspected scientific significance, we may refer to our author's account of the rich effect due to the action of the loud pedal of the pianoforte (pp. 110-113).

The chief interest, however, of Mr. Taylor's book is due not so much to lucid exposition of physical science as to the intimate acquaintance of the author with the two sides of musical theory, the physical and the æsthetic. The writer has a deserved reputation in the musical world, and his book clearly enough shows the lover of art quite as much as the disciple of science. Thus, when explaining the defects of the tempered scale as adopted in keyed instruments like the pianoforte and the organ, Mr. Taylor uses the opportunity (p. 206, seq.) of urging the practice of vocal music independently of these instruments, and reiterates what has been repeatedly preached since the time of Rousseau as to the desirableness of a musical notation, such as Mr. Curwen's tonic sol-fa, which would facilitate the separate cultivation of the voice by expressing all intervals in terms of their relation to the tonic or key-note. So our author has some very judicious remarks (p. 215) on the relation of physical to æsthetic law. According to the theory of Helmholtz, the most perfect concords—that is, those in which conflicting upper tones are fewest and feeblest—are the octave, and, next to it, the fifth. But, as Mr. Taylor reminds us, these are not the most pleasing to the ear, the third and sixth being certainly much more grateful combinations. In other words, the æsthetic value of tones depends on a variety of elements, smoothness being but one. We are inclined to regret that Mr. Taylor did not follow up the search briefly hinted at (p. 217), for some of those other considerations which make musical combinations delightful. More especially the very interesting phenomena of key relations, touched on in this place, might have been appropriately discussed in a work that undertakes to treat of sound and music; and indeed Professor Helmholtz in his treatises gives a very full account of the laws which have helped to determine the selection of our key system. The illustration of physical theory by means of the historical developments of music forms one of the most valuable ingredients of the German work, and it seems not a little surprising that so cultivated a musician as Mr. Taylor should have wholly neglected to avail himself of these very striking illustrations and verifications.

Mr. Taylor is generally so accurate that any seeming omission of a due limitation to an assertion is pretty certain to arrest one's attention. For instance, he tells us (p. 134) that if two tuning-forks forming the interval of an octave are sounded

together, the ear soon ceases to regard them as two tones, and hears instead one note having the pitch of the lower, and a quality more brilliant than that of either. But this is, we presume, only true provided the note of the higher fork bears some relation of intensity to that of the lower. If it were very much more powerful, it would certainly continue to make itself heard as a distinct note. Again, it scarcely seems a correct analogy when Mr. Taylor contrasts (p. 146) the power of the ear to single out a constituent tone of a clang with the inability of the eye to detect the two curves which are not really present in the resultant curve, but simply serve to produce it. The true analogy would be with the inability of the eye to analyse composite light into its constituent colours—say, purple into blue and red—though it is hardly certain that the organ might not be trained to such analysis just as the ear confessedly requires discipline in order to develop its capacity. It may be added that Mr. Taylor does not sufficiently economize language when he speaks of “an external objective existence” (p. 152), and perhaps it is not quite correct to deny this attribute to “a state of motion of certain air particles.” The naming of such trifling inaccuracies may serve to show how very correct Mr. Taylor proves himself in all the more important features of his exposition.

TEGETMEIER'S POULTRY BOOK.*

AT a season when eggs are fabulously dear, and when fowls, if obtainable at all, are only to be obtained at double the price they used to fetch, it cannot be ill timed to notice the new and much improved edition of Mr. Tegetmeier's *Poultry Book*. The author's merited reputation as an experienced master of his subject secured acceptance for his first edition six years or so ago; but, instead of being content to reproduce it in the same form, he has in the interval added greatly to his former stores of information, and has so rearranged his chapters that those who take an interest in fowls for the supply of the table, and those who value them chiefly as egg-producers, will now find each topic discussed in separate parts of the volume, divided, as is meet, by a new chapter on the best way of fattening poultry for culinary purposes. One great recommendation of the book is its soberness and practical tone. Mr. Tegetmeier is not tempted into extravagant speculations, even theoretically, by the annual value of French eggs, which, including exports, is said to be 125,000,000 francs, or of French poultry, which is much the same. He was never taken in, like some of his contemporaries, by the “de Sora” hoax of a gigantic poultry establishment near Beauvais, or by a later hoax about another at “Charney, a picturesque village near Paris,” kept by a certain Madame de Lenas, and duly chronicled by the English author of the *Practical Poultry Keeper*, though neither of these bird-towns had any more real existence than the “Nephelococcygia” of Aristophanes. In fact, he does not encourage us to indulge in dreams of rearing poultry in very large numbers, although he records the success of poultry fattening establishments such as that of Mr. Olliver, of Rushlake, near Warbleton, in which chickens collected and purchased from cottagers are prepared in great numbers for the London market, the work of cramming them being done by machinery. All he maintains is that, properly taken up, poultry-keeping will yield a very satisfactory market return, though there is a limit to supply, and though the birds are more costly to produce than butchers' meat. What is necessary is to avoid vagaries and extravagances, and study common sense principles and methods, in which the French manifestly beat us. The fowls of the district of La Bresse, in the North-East of France, which take or took most prizes in the Paris fat poultry shows, owed their success not to superiority of breed, nor to greater size, but to the careful and systematic fattening on buckwheat and milk which gave a plumpness at three months old to birds of the ordinary farmyard type not attained by French fowls of much purer breed and much more famous antecedents. This is a fact which deserves to be known by those who have not the advantage of prize fowls to improve and give a tone to their poultry-yard. A great deal, it seems, may be achieved by simple care, system, and attention to common sense details, without the introduction of expense in staff, accommodation, commissariat, and so on. Indeed, if you take the pains to get a hardy breed, such as the half-bred Brahma and Dorking chickens, such a breed will almost take care of itself.

The earlier pages of the *Poultry Book* are full of evidence that natural conditions are more conducive to the health and fertility of the poultry-yard than the appliances of costly civilization. Chickens that roost in trees and coppices during summer and early autumn are always found in much harder condition and finer plumage than those which roost in houses.

The Peacock, Guinea-fowl, and Pheasant, natives of much warmer climates than our own, do not require the shelter of a roof; and young fowls of different varieties, in the highest possible condition, are often found which have, even as late as Christmas, never been within a building of any kind.

It is proved, too, that hens which select a hiding-place for incubation produce more chickens, and healthier chickens, than those which enjoy the luxury of the best hen-house nest. Nor, though the poultry books are apt to preach against the dangers to

* *The Poultry Book*. By W. B. Tegetmeier, F.Z.S. With Pictures by Harrison Weir. Printed in Colours by Leighton Brothers. London: Routledge & Sons. 1873.

the health of fowl and chicken from letting the hens range till the dew is off the grass, does it at all appear that hens allowed to roam at will and to feed a-field at 4 A.M., fail to rear the finest chickens, any more than that dew is fatal to the notoriously more delicate young of the pheasant and the partridge. American experience corroborates Mr. Tegetmeier's clearly propounded view that the only way of rearing poultry together on a large scale is not in such poultry establishments as the defunct palace at Bromley, but in widely extended ranges such as would be congenial to the wild bird. Mr. Leland, of New York, gives up to his fowls eighteen acres of rough land, an acre to the hundred, full of bushes, weeds, sand, ash-heaps, lime, and bones, a pond of water, and a specially ploughed-up worm preserve. He has, he tells us, often as many as three thousand spring chickens.

All this tends to show that the secret of the profitable rearing of poultry does not lie in the houses which those who can afford it cunningly contrive to please the eye and to confine the bird. No doubt such houses, if they have a south aspect, a dry site, a pure atmosphere, and the essential of cleanliness, and especially if a wall to the north or at the back secures warmth and shelter, give great advantage and an almost certainty of successful operations. But the state of nature ensures many of these requisites, and civilization sometimes overlooks them. For instance, it is of great consequence to keep the floor of the poultry-house free from droppings, and its atmosphere pure from the taint of decaying organic matter. At Bromley this was done by covering the ground enclosed with a thick layer of dry pulverized earth, on which the manure fell, and which acted as a perfect deodorizer. This earth was constantly changed, and in some schemes a wooden tray or movable flooring facilitates the process. But, as we read in the *Journal of Horticulture* (July 10), some amateurs, intending to do the thing handsomely, lay down a brick floor in cement, and so engender disease of the feet and legs in their fowls, from the retention of moisture and insufficient drainage. The flooring of a poultry-house should be a three-inch coating of dry gravel, or a mixture of gravel and coal ashes. Turned over lightly with a spade now and then, this will not need replacing for two or three months; whereas the brick floor, besides other faults above mentioned, is not easily deodorized. One advantage which the houses have over shrubberies and coverts is that there is more protection in them against the rapine of the fox and the inroads of the rat; perhaps too, under a patent lock and key, they may afford security against the quite as common two-legged thief who not infrequently sells you your own eggs and chickens. But, on the whole, it seems plain that for the table supply, whether in fowls or eggs, it is best that we should look to the simpler processes of farmyard and cottage rearing, and that old-fashioned mode of poultry-keeping which goes on at the back of country houses, and should leave the niceties and refinements to those who breed and feed for exhibition purposes.

It is essential, however, to this end that there should be sense and system in respect of the kind of fowls kept. Nothing but deterioration can come of the barn-door principle carried out in thorough indifference to breeds and strains. If a yard is full of these mongrels, and it is inconvenient to make a clean sweep and to import in their place one or two good breeds that will do well together, the best way to improve it, with an eye to the production of market poultry, is to introduce a good Dorking cock:—

In the following year (all the young cross-bred cocks having been fatted for the market) the most serviceable pullets of compact shape and short on the legs should be alone retained for stock, the Dorking cock being exchanged for one not of the same blood. By following this plan for a third year, the chickens produced will be seven-eighths Dorkings; and thus, at a very small expense and trouble, a farmyard of comparatively worthless, unsaleable stock may be converted into really valuable marketable birds.—*P. 102.*

On the other hand, no worse cross for the barn-door fowls can be imagined than that which, owing to the fashion of past years, is of very common occurrence—namely, with the Cochins. The result is, to use Mr. Tegetmeier's description, a "gaunt, weedy, stilty, big-boned, angular, yellow-legged bird," rejected by the Londenhall salesmen, and consequently passed over by the higglers.

Assuming that, directly or indirectly, it is for the table, for home consumption, or the market, that poultry are reared and fatted, it is not hard to glean from Tegetmeier, with whose dicta most housewives and practical poulterers will agree, which are the likeliest and least costly breeds to keep. Two data on the subject are that "a table fowl should be all breast, with short limbs and small bones," and that fowls are only in perfection for the table before they have attained their full development. This guides us to the choice of birds of a broad full-breasted type, and also having an aptitude to ripen early and to repay attention to their keep. A good many sorts may be put out of the question. The build of the Malay fowl, with its great height, long snaky neck, and elongated shanks, promises little in appearance; yet because it combines a large and plump breast with a good flavour of flesh when killed early, it has some pretensions as a table fowl. This may be considerably enhanced by a cross with a Dorking hen, which will produce an extraordinary table fowl. The Spanish breeds, second to no fowls for great production of large eggs, limited however to the summer season, are out of the question for table purposes, on account of their dark legs, which the cooks and poultry dealers object to; though the Minorca breed, which is akin to them, and has taken strong root in Cornwall, Devon, and the West of England, is a better and plumper table

fowl, besides equalling its relations in laying. The game fowls have the drawback of a yellow skin, though their flesh is well flavoured; the Polish are a delicate race, very sensitive to damp, though useful as interminable layers; and the Hamburgs, though excellent in flesh and flavour, and having more flesh than you would expect from their size, are also somewhat delicate, and not what might be called an early fowl. None of these, though each has some characteristic merit, realize what we desiderate—"a large-sized, hardy breed, which will yield, without trouble or coddling, a good supply of large early chickens." At the first blush it might appear that the Cochins had a claim to consideration, but inquiry will prove that this is only for home consumption. Its yellow skin, its tendency to put on fat, and most of all its development of leg at the expense of breast, the inferior parts at the expense of the finer—though it should be said, in extenuation, that the Cochins' leg is much less tough than that of other fowls—disqualify it for a first-class table fowl, though it has very high merits, such as hardihood, winter prolificacy, docility, and quick growth for household purposes. Mated with the large French fowls, the Cochins produce chickens of rapid growth and large size, fine, fat, white-skinned table-birds, though not of course admissible for exhibition, or for stock purposes. Of non-European birds, a category in which we may safely place the Brahmas, though it is a vexed question whether they are Asiatic or American in their origin, there can be no question that the most useful importation for all purposes has been the Brahma, the largest and finest of domestic fowls. With full, broad, prominent breast, a back short and broad between the shoulders and across the hips, a curved, slender neck, and wings small and tight, the true Brahma is a good fatterer, a first-rate table fowl, early ripe, and, at maturity, of enormous proportions. Whiter, tenderer, juicier than the Cochins, it is quite as docile, and will keep itself better. It is also very hardy, will stand wet and cold, and is a good layer, especially in winter. Mr. Tegetmeier introduces into this edition a hint to the judges in poultry shows designed to avert the deterioration of this excellent breed. The tendency, it seems, is to award prizes to size, and not, as the schedule directs, to high condition, beauty of plumage, cushion and fluff about the thighs, purity of race, and other characteristics. And if this be persisted in, the danger is that we may get, in the place of true Brahmas, "gaunt, flat-sided, taper-sterned, short-feathered" creatures, far removed from the ideal which has till recently been very nearly realized in the best prize-pens. A thorough John Bull will go in for Dorkings, and small blame to him. They grow very quickly, and put their flesh, as they should, on the breast, wings, and merrythought. The coloured breeds are best for size; but all the Dorkings, coloured, white, or silver grey, are remarkable for delicate white flesh, symmetrical shape, and equal distribution of fat. As they are apt to suffer from over-feeding, it is in their favour that they like a good and large grass run, and do best with a fair amount of liberty. Where this is not feasible, the cross between a Dorking and a Brahma will be doubly desirable; for the result will be very hardy, quick-growing chicks of great weight and first-rate table quality, the Brahma introducing domesticity and adding stamina. Such cross-bred chickens "are not equal to pure-bred Sussex or Dorking as first-class market fowls, but from the greater number that can be reared on an ordinary farmyard, where no very especial care is given to them, they will be found much more profitable." But we must not forget the cream of the French breeds, the Houdans, worthiest of his fellows to rank with the Brahma and Dorking as the most meritorious of fowls. Large, heavy, short-legged, with small and light bones, and a minimum of offal, like the coloured Dorking, they are hardy and quickly reared, and mature with great rapidity. The chickens are fit for the table at four months, and the flesh is fine and white. The eggs too of the Houdans are numerous, and generally fertile. It must be added that they are indifferent hatchers. As they very rarely sit, it is well to keep a few Brahma or Cochins hens to hatch their eggs, which will not be confounded with those of the hatchers, as the latter are buff-coloured. On the whole, as a few hardy breeds are better than many of various merit and degrees of constitution, we should gather from Mr. Tegetmeier, as indeed from our own observation, that Brahmas, Dorkings, and Houdans are the best investments—taken all in all—for the poultry-yard.

As to the questions of comb and toe, and markings which are points of excellence in the standards of various breeds, these are discussed with clearness and judgment by Mr. Tegetmeier, and we commend his remarks to all intending exhibitors. Our purpose has rather been to glean hints for the present atreps from this very useful book of reference. It is indeed a book that will not fail the inquirer, be his quest what it may. In it we learn how well the French systematically fatten fowls for market on buckwheat meal, bolted fine and kneaded up in sweet milk to the consistency of baker's dough, and then cut up into two and a half inch pellets; and how another French plan, for which our author will not vouch, is to fatten wholly with liquid food. Two meals a day punctually, given at an interval of twelve hours apart, are a *sine quid non* of successful fattening. We also find full particulars of Mr. Olliver's mode of "cramming by machines"; and cooks, amateur and professional, may learn something from the pages as to plucking and trussing fowls, which are taken from the writer on high-art cookery who signs himself "G. C." No known breed of domestic fowl, from the giants of the poultry-yard to its veriest dwarfs, from Brahmas to Bantams, and whatever is

between, is overlooked in this comprehensive volume, which includes also turkeys, pea-fowl, and guinea-fowl, as well as the aquatic fowl, on which we have no space to touch.

THE WRONG MAN.*

MRS. MONTGOMERY'S present book is about as unlike her former one as one book can be to another. *Mine Own Familiar Friend* was distinguished by an extraordinary want of morality in tone; it transported us to places where the existence of such a thing as principle seemed a yet undiscovered fact; its scene was laid in unconventional lands, and its characters had a daring disregard for the conventional rules that are supposed to hold society together. The *Wrong Man*, on the other hand, aims at a high purpose. The places we visit through its pages are those which must be well known to the majority of readers, and the ideas of the leading personages err on the side of Quixotism. The story opens prettily enough with a visit of Madeline Fairley—whom we may take to be the heroine of the book, though she is hard run for that place—to Mrs. Herbert, to whom she has to communicate the good news that she is going on a foreign tour with some friends of her father's. Madeline is known by the name of Beechnut, in consequence of the brown colour of her hair and eyes. Her description is the least good part about her, and presents to our mind's eye, when we analyse it, a sort of monster fit to be carried around in caravans rather than the pretty bright girl who is supposed to be. For we are told that "her skin, in the shadows of her face, wherever they happened to fall, had a warm golden tint which harmonized so well" (so well as what?) "with hair and eyes." Also that "the shorter hair was clipped into a little fringe—thus blending in a soft haze the dark roll of hair above, and the golden-shadowed, ruddy-tinted face." It is difficult to conceive a more appalling spectacle than this young woman whose hair, skin, and eyes were all of the same hue, and all blended into a soft haze. Mr. Wilkie Collins's ghastly blue man in *Poor Miss Finch* was nothing to her. She was, however, probably not so brown as she is painted; for wherever she goes she is popular and sought after, and produces a pleasant impression. Upon Mrs. Herbert's face, however, one cloud is cast by Madeline's mention that she may be passing through Germany; for Mrs. Herbert has a son, who years ago committed some mysterious and dreadful crime, in consequence of which he had to fly the country, and he is supposed to be now wandering in Germany. Given these conditions, it is not difficult to see what the result must be if the formula of novel romance is adhered to. A young man of hitherto exemplary character becomes suddenly most abandoned, commits a felony, and flies the country, killing his father and breaking his mother's heart by his conduct. Therefore he must be innocent of the crime which has clouded his life. A young lady brought up on intimate terms with him in childhood travels through the country which he has sought as a refuge, starting with a violent prejudice against him, which, by dint of her having him continually forced on her notice, grows to absolute horror. Therefore she cannot but discover his innocence and fall in love with him. Add to the before-mentioned data that the Franco-Prussian war is going on at the time of the girl's travels, and that she becomes a nurse, and the imagination, or, we should rather say, the logical faculty, will at once supply a pallet in a hospital ward, a wounded soldier stretched on it, a hazy reminiscence of his face and voice, developing into perfect recollection, a start of horror, and a final explanation.

But, although the outlines of Mrs. Montgomery's story are conventional enough, there is much in the detail that is not so. The description of life and things in Brussels is bright and clever, and if nobody ever plunged on a first introduction at a drum deep into the discussion of creeds and no creeds, as do Madeline, M. Le Ferrier, and Camille Vonderblanc, at least their conversation is more interesting than the sickly badinage and teapots flirtations which make the dialogue of so many society novels. Camille Vonderblanc is Mrs. Montgomery's best performance in the way of character drawing, and there is a good deal that is fine in her. The doubts that arise in her, born chiefly of the continual spectacle of her mother's worldliness and hypocrisy, her calm dignity and strong purpose, all make her interesting. But the strength of mind with which the author has endowed her is the cause of a serious flaw in the book. The means by which she is finally converted to the Church of Rome (almost every one in the book is a Roman Catholic) are so weak and ill explained that our belief in her existence is destroyed when we read of the incident, and we feel that she has been set up, like the wooden popinjay of the Dresdeners, and given an appearance of strength and stability, only to be knocked down with the greater glory. Convictions so easily attained can be of but little worth, but conviction at any price seems to be the rule in the *Wrong Man*. A dinner party is given by Mr. and Mrs. Fitzgerald, the friends with whom Madeline is travelling, during their stay at Brussels, and to this dinner come Mr. and Mrs. Huskinson and their son Godfrey, who was in the same bank with the unfortunate Frederick Herbert and knows the history of his disgrace. Godfrey Huskinson is a young man of singularly attractive manners and appearance, with a feminine eloquence in his nature, and a restless vivacity

in conversation. When we hear that this bright manner is every now and then crossed with a mysterious cloud, and that when his gaze falls "on the bowed head and beautiful features of a Prussian soldier who is kneeling in the cathedral at Köln, whither the whole party travels, we can have little doubt who and what Godfrey Huskinson is. And, in fact, in the next chapter a meeting takes place between him and the soldier, who is of course none other than Frederick Herbert, which reveals, what we have before suspected, that Frederick is for some reason bearing the burden of Godfrey's guilt. The scene of this meeting, a little house across the bridge, affords opportunity to the author for a singularly fresh and pretty description of the house itself and of the martens who have made their nests under its roof. Specially good is the description of their notes:—

Meanwhile the chirping and the chattering went on without much difference year after year, and all day long. It began before the sun was up; it was always joyous beyond any sound known to human beings. Nothing in words can so ripple and run over, and chip and twitter with sheer glee, as the note of the marten. It is not a song, for a song expresses a modulated sentiment; but this is simple cheeriness. The thing in human life that comes nearest to it is the babble of French children let out to play; but even that is harsh, compared with the sweet gurgle, as of bubbling bliss, that pours forth by the hour from the martens' little quivering throats.

The scene of the meeting, too, is finely imagined, and so well worked up that in reading it we almost forget the impossibility and inconsistency of such a character as Herbert's. From Cologne we are carried to Chillon, where an underplot of Godfrey falling in love with Madeline, and Lucy Fitzgerald falling in love with Godfrey, and somebody else falling in love with her, "and so on *ad infinitum*" begins, and an expedition across the Tête Noire, ending in Godfrey saving Madeline from a fall over a precipice, gives him an opportunity for declaring his feelings for her.

The dangers of this well-known pass, which is a particularly "broad way," are exaggerated in a manner scarcely warrantable even in a novel. We cannot remember ever to have gone for the most part in single file when crossing it, nor even at "the wildest and most savage part" to have seen anything approaching to the dizzy horrors which Mrs. Montgomery describes. The incident indeed seems to us altogether unnecessary and purposeless, unless it were meant to rehabilitate Godfrey somewhat in the reader's eyes—a thoroughly hopeless task. Our sympathies are meant to be, to a certain extent, excited for him throughout; but it is as impossible to believe that so contemptible a scoundrel could have so much to recommend him as it is to imagine that so fine a character as Frederick Herbert could have been such an idiot. The war to which we are introduced soon after these events gives occasion for many clever and well-touched sketches of character and scenery. Mr. Pearson, the surgeon who has come out for love of operations, and for whom the "war had nothing to do with the interests of France or the glory of Prussia, hardly perhaps even with the sufferings of humanity, although nothing could exceed his tenderness and attention to his patients," is rather a fascinating person, and we are sorry to see so little of him. The great scene of the war episode, however, is that in which Camille, going out to save her high-souled lover, Le Maître, from the horrors of a promiscuous burial with her own hands, ends by restoring him unexpectedly to life. This scene is a mistake. Even if all the force and power of reticence, as well as of expression, which such a description requires were brought to bear on it, it could not fail to be ghastly and repellent. As it is, it becomes revolting. When Le Maître has been saved from the jaws of death in time to marry Camille, nothing remains but to extricate Frederick Herbert from his false position, remove from his shoulders the burden they have so long and so unjustly borne, and marry him happily to Madeline. The most obvious and simple method of effecting this is a death-bed confession by the miserable Godfrey, a general mingling of tears, and a final arrangement by which all becomes, to use the expression of the madman in *Nicholas Nickleby*, "gas and gaiters." And this is accordingly done; but we must enter a protest against the doctrine which Mrs. Montgomery appears to uphold, according to the account of his seven years' sacrifice of name and honour which Frederick Herbert himself gives. Here we have one young man doing for another, to whom it is true he bears a love deep as a brother's, a thing which he would have no right to do, however strong that other's claims were upon him; and in this case there is no claim save that of affection. To save Godfrey from disgrace and punishment, to save him from bringing agony upon his parents, who have centred their lives in his, Frederick Herbert, himself an only son, every whit as dear to his parents as Godfrey to his, takes upon himself the blame of Godfrey's disgraceful crime, flies the country without an explanation, lives practically outlawed for seven years, and by so doing brings his own father to the grave and his mother to heart-broken despair, while the real criminal's parents hug their darling boy to their hearts' content. And the crowning reason for Herbert's doing this, the one thing that overbears all regret, all sense of his natural duties and affections, is that by this sacrifice, by the continual heaping of fiery coals on Godfrey's head, he hopes at the last, to use his own expression, to save his soul. And this we are to count well bought at the price of a father early killed, a mother prematurely broken down. Such a theory as this can scarcely require comment. We regret that Mrs. Montgomery should have selected it as the leading idea of what is otherwise a pleasant series of pictures of life and scenery. The author should pay more attention to her grammar and spelling. Such sentences as "though often not in the best taste, she yet felt an

* *The Wrong Man*. By the Hon. Mrs. Alfred Montgomery, Author of "Mine Own Familiar Friend," &c. 2 vols. London: Hurst & Blackett. 1873.

attraction for the strongly delineated intensity betrayed by the objects of devotion," such words as "teaming," for "teeming" all under the head of inexcusable blunders.

GERMAN LITERATURE.

THE latter volumes of the collected edition of Grillparzer's writings* contain his acted but unpublished plays, those entirely new to the world, his novelettes, and some miscellaneous prose writings. Of the dramas new to the press but not to the stage, the principal is one on the history of Hero and Leander, quaintly entitled the *Waves of the Sea and of Love*. It would have been better, perhaps, if the poet had avoided a subject so nearly akin to that of his *Sappho*, of which the present piece appears to be a feeble reproduction. It is nevertheless replete with poetical beauty; and we can easily admit the editor's assertion that it has proved successful in the rare case of an actress being found capable of reproducing the innocent sensuousness, the purity of soul and warmth of blood combined in the character of Hero. The character, however, charming though it be, is rather idyllic than dramatic, and the simple plot is insufficient to furnish material for five acts. *To Dream, to Live*, is a fanciful Oriental drama, in which the influence of Calderon and Gozzi is manifest. It is ingenious and poetical, but belongs to a class which must always be an exotic on the modern stage, though it is stated to have fairly established itself as a stock piece at Vienna. The new plays *Fraternal Strife in Hapsburg* and the *Jewess of Toledo* display Grillparzer in the light of a most accomplished writer for the stage; the former piece in particular gives a stirring representation of the times to which it relates, equally truthful and picturesque. Both, however, are too palpably works of reflection; a genuine vein of poetry distinguishes the writer from the mere playwright; but his work is nevertheless rather a manufacture than a spontaneous growth. The last volume contains Grillparzer's little tales, which are interesting, but not remarkable; a circumstantial analysis of the plays of Lope de Vega; and a series of detached thoughts on religious and philosophical subjects, expressed with the simplicity and independence characteristic of the writer.

The biographer of the late leader of the Prussian Liberals, Leo Waldeck†, has restricted himself to an account of his hero's political, and especially his Parliamentary, career. Waldeck belonged to a class of politicians of whom Prussia, fortunately for herself, has produced numerous examples—accomplished jurists who, while professionally sensitive to all infringements of popular rights, have from the same cause been indisposed to any but a legal and constitutional resistance. Waldeck's principal qualifications for the prominent part he was destined to perform seem to have consisted less in superiority of genius than in superiority of character—undaunted courage, prodigious industry, perfect disinterestedness, and a Parliamentary leader's faculty for organization and control. His reputation acquired great adventitious lustre from the defeat of an iniquitous prosecution to which he was subjected on account of his share in the events of 1848; and when at length, after a long suppression of all national life, Parliamentary government revived at the accession of the present Sovereign, he found himself at the head of the so-called Progressive party in the Prussian Chamber. His name will be chiefly remembered for his share in the long conflict between the majority of the Chamber and the Bismarck Ministry on the subject of the military budget, the issue of which, from a totally unexpected turn of circumstances, so notoriously falsified the predictions and disappointed the expectations of constitutional Liberals throughout Europe. It proved, however, an admirable course of political education for the country, and, notwithstanding Prince Bismarck's complete success, he has since found it advisable tacitly to adopt the principles of his opponents. Waldeck appears to have accepted his defeat with a good grace, and to have laboured for that union of the aristocratic and liberal elements of the nation on the common ground of the public good which Prince Bismarck's present policy absolutely requires as a condition of success. His part in politics, however, was less prominent after the War of 1866. He died in May 1870.

The fourth volume of Ferdinand Gregorovius's sketches from Italy‡ is devoted to the central region of the country, commencing with a highly interesting account of the unique remains of Byzantine art at Ravenna, that strange city so picturesquely placed on the confines of the ancient and the modern worlds. There is also a pleasant narrative of an excursion in Umbria. In general, however, the contents of the volume are of an historical and political character, the most important being an essay on the relations of Italy with the Holy Roman Empire of the middle ages, and a very circumstantial narrative of the invasion of the Papal territory by the Garibaldians in September 1867.

An appropriate destiny has despatched one of the driest travellers in the world to one of the driest countries. It would be unfair to assume that Herr von Schlagintweit§ would have been

incapable of picturesque description with more promising materials; nor can it be denied that there is something impressive in the very bleakness, barrenness, and monotony of the Tibetan highlands which it has fallen to his lot to traverse. Undoubtedly, however, the predominant feeling on closing his volume is that traveller and country are exactly made for each other. The dry, stormy, shadowless land, alternately scorched and frozen, in its physical features almost a copy of the inhospitable surface of the moon, with its scanty animal life, apathetic population, uneventful history, and stereotyped semi-civilization, is fitly allotted to an explorer whose narrative reads like a catalogue, and whose contributions to our knowledge, in the present volume at least, are mainly confined to the mapping-out of routes, the measurement of elevations, and readings of the barometer and thermometer. These particulars no doubt have their importance. We do not forget our indebtedness to the brothers Schlagintweit for an interesting account of Tibetan Buddhism; and it may be hoped that the collections formed by them in the country will yet prove of value in a philological point of view. All this does not alter the fact that this volume is almost wholly unreadable except by the select few who may themselves be contemplating an expedition to Tibet, and who, on the principle that "there's nae wale o' wigs on Munrimmon Moor," may be thankful for information in its least inviting form. The book is divided into six chapters, the first five treating of as many different districts of Tibet, the sixth of the author's residence in the capital, which is distinguished by an extraordinary penury of personal detail. The aridity of the book is, however, occasionally relieved by some trait of the national customs, which almost seems to have found its way in by accident.

Dr. A. Dorner*, the son of the celebrated theologian, has produced an essay on the theological system of St. Augustine, mainly undertaken with the view of determining whether Augustine's place is among the doctors of the Church or the precursors of the Reformation. The conclusion arrived at is that, notwithstanding the numerous points of sympathy between Augustine and the Reformers, he is in no way estranged from the general current of Catholic tradition, and must indeed be regarded as the principal founder of the mediæval scholastic theology. This opinion is grounded upon a very minute and methodical, and apparently perfectly impartial, examination of the Augustinian theology, drawn out and digested under its several heads. In the course of the inquiry the simple-minded reader will perhaps be most forcibly struck with the difficulty of attaining any conclusion on the matter, owing to Augustine's perpetual inconsistency and habit of resorting to any argument available in the particular controversy in which at the moment he might happen to be engaged. To determine his views from his own contradictory assertions seems impossible, and the conclusion from the general spirit of his writings, to which Dorner is inevitably compelled to resort, is manifestly liable to fallacy. One of the points here chiefly insisted upon is the degree in which Augustine is held to have been influenced by the speculations of the Neoplatonic philosophers. The chapter of most general interest is that on Augustine's views of the relations between Church and State, which seem hardly distinguishable from those propounded in the Syllabus.

Although Professor Frohschammer† of Munich has been publicly associated with the Old Catholic leaders in protesting against the encroachments of Rome, we are not aware whether he is formally recognized as a member of their communion. Should this be the case, its orthodoxy on the one hand, and its comprehensiveness on the other, seem likely to be severely tested, and important issues may depend upon the decision arrived at. In his professed answer to Strauss, all affectation of fidelity to dogmatic tradition is discarded, and the view of religion presented is one which Strauss would have had little difficulty in accepting if he had remained on his old metaphysical ground, instead of reporting to merely materialistic explanations of intellectual phenomena. Frohschammer is severe upon him as an apostate from philosophy, and dwells with considerable force upon the weakest points in his work, his too implicit reliance upon mere scientific hypotheses, and his too absolute identification of Christianity as a whole with some of its peculiar phases. His own conception, however, leaves Strauss hardly anything to except against, particularly as on some important points where the writers are professedly opposed the point in dispute is virtually conceded by the liberality of Frohschammer's definition. On such questions as that of miracles his heterodoxy is flagrant and un concealed. There may be nothing in the writer's ecclesiastical position to necessitate any official notice of his work, but the problem how to deal with the latitude of free thought in the Old Catholic body is evidently one that will soon demand a solution.

The second volume of Moritz Petri's edition of Hamann's works‡, arranged in chronological order, contains a number of miscellaneous essays and letters, with a biography and commentary interspersed

in detached portions. We confess to a considerable difficulty in accounting for the reputation of this desultory and enigmatical writer, whose ingenuity is expended in the oracular proposition of commonplaces, and whose style, like his life, has something furtive, indirect, and uncomfortable.

Herr F. Prætorius's attempt at the explanation of the Himyaritic inscriptions* may be interesting even to the unlearned reader, as conveying some idea of the extreme difficulty of the task. The absence of vowels in Semitic languages opens a field to conjecture more convenient for the license of speculation than conducive to the attainment of sound results. The translations here submitted, however, read neatly and plausibly.

The intentions of Herr Schroot †, the author of *Science and Life*, are no doubt excellent, but we cannot say much for the execution of his treatise, which is mainly a collection of incohesive and ill-digested remarks on the evils of life and society, moral and physical, real and imaginary.

Professor Pernice's "Labco" ‡ is designed to convey, under the name of that celebrated lawyer, a general view of the condition of Roman law during the first century of the Empire, a period when political change had necessarily produced important modifications in jurisprudence. The work bears evidence of great research, but its interest is purely professional.

Herr Eduard Grisebach § is an amateur of the dainties and tit-bits of literature, morsels frequently more remarkable for exquisiteness than for wholesomeness. To the limited number of such delicacies he has himself made a noteworthy addition, if the *Neue Tannhäuser* is correctly attributed to him. We are now indebted to him for a copious analysis of the literary history of one of the most popular pieces in this line, Petronius's story of the Ephesian Matron, with a translation of it in its Chinese version. This rendering has already become classical in English literature through Goldsmith's imitation in the *Citizen of the World*, which we cannot agree with Herr Grisebach in considering inferior to the original story. Goldsmith, however, could only follow an imperfect French translation, while Herr Grisebach's version is made from a full and accurate English rendering published in the *Calcutta Review*. He has added an ample discussion and investigation of the numerous forms which this standard illustration of female inconstancy has assumed in the modern literature of Europe. The Chinese version, after all, is not the original, the allusion to Buddhism as an established religion indicating that it must have been made some centuries posterior to Petronius. The fiction probably originated in India.

The popular songs of the Engadine, translated by A. von Flügel ||, are distinguished by the grace, innocence, and simplicity to be expected in the indigenous poetry of a romantic and secluded district, inhabited by a race endowed with much natural refinement and a fluent and musical language. This dialect appears to be intermediate between French and Italian, but with a greater affinity to the latter. Its simplicity and melody are evidently incapable of exact reproduction in German, although Herr von Flügel has wrought ably and well, and scrupulously abstained from all attempts to embellish his original. The subject of these pieces, all orally transmitted from a period of uncertain duration, is in general the passion of love, a number of pieces on the incidents of war and the chase having faded out of recollection with the events that called them forth. Their structure is in general most artless, there are few strokes of signal originality or tenderness, but their charm consists in their perfectly unstudied naïveté.

It is not easy to discover why August Trümpelmann should have chosen to tell the story of Vivian Perpetua's martyrdom ¶ in blank verse. The subject is indeed highly suitable for dramatic treatment, but, if conceived epically, gains nothing from being exhibited under metrical restraints, which involve the sacrifice of most of the picturesque detail which might otherwise have enriched and relieved the bare tragedy of the story. Herr Trümpelmann's treatment of his theme is earnest and matter-of-fact; his verse may be commended for energy and simplicity, but certainly affords no evidence of any such overwhelming enthusiasm as to compel or justify the assumption of "singing robes."

The first two volumes of Johannes Scherr's collected novels** are occupied by that terror of all readers of this department of literature, a *kulturhistorische Novelle*. The subject is the life of Schiller, and the author appears to have faithfully complied with the rules of the most utterly worthless class of composition yet discovered by human ingenuity. The novelettes in the third volume have at

least a comparative value, as they profess to depict peasant life in Switzerland. The collection is ushered in by a singularly egotistical preface, announcing the author's impending retirement from world obstinately bent on ignoring him.

The last number of the "Russian Review" * contains, with other interesting matter, the continuation of F. Matthäi's important articles on the commerce of Russia, and an essay by Professor Brückner on Catherine II.'s attitude towards the French Revolution. The points principally brought out are Catherine's sagacity in foreshadowing the Revolution, and her anxiety to egg on Austria and Prussia to put it down, while she carried out her own projects of aggrandizement without fear of interference.

VICTOR EMMANUEL AT VIENNA AND BERLIN.

THE Archbishop of PARIS and the political and religious fanatics whom he represents have received, in the accounts of the reception of the King of ITALY at Vienna and Berlin, the most significant answer to the late indecorous Pastoral. Clerical politicians not only disregard national honour and general expediency in their exclusive pursuit of sectarian objects, but they are often as injudicious in their choice of means as they are unscrupulous in their exclusive preference for corporate interests. It was highly imprudent to pledge the party which seeks to be dominant in France to a foreign and aggressive war as the first result of its success. The cause of legitimate Monarchy can only be weakened by the announcement that it would involve now and gratuitous sacrifices; nor was it necessary to give notice to foreign Powers that the restoration of so-called order in France implied a general commotion in Europe. M. THIERS, notwithstanding his obstinate antipathy to Italian unity, has uniformly proclaimed a peaceful policy, at least until France may have the opportunity of forming some powerful alliance. The Ultramontane faction has now done its utmost to alienate Austria while it challenges the hostility of Italy and Germany. The King of ITALY would have been in any circumstances courteously received at Vienna, but his relations with the Austrian Empire have during the greater part of his reign been those of open antagonism. The Emperor and his subjects might indeed well afford to forgive the losses which were associated with the victories of Custoza and Lissa; but the only capacity in which the Austrians could regard the King as an ally was as the representative of national independence against the pretensions of Rome. The clerical faction took care to point the meaning of the popular applause by offering feeble affronts to the Royal visitor. The general favour with which he was received expressed the repugnance both of Austria and of Hungary to the revival of the policy of the extinct Concordat. The Emperor FRANCIS JOSEPH, though he may perhaps retain the personal preferences of his youth, has long since felt the necessity of choosing between national opinion and ecclesiastical tendencies. In his exchange of courtesies with the alleged usurper of the sovereignty of Rome he has taken one more occasion to repudiate all disposition to engage in a Papal crusade. The lay Catholic world, which is supposed in polemical literature to be outraged by the abolition of the Pope's temporal power, seems, except among a portion of the French population, and perhaps in Ireland, to be nearly unanimous in its approval of the Italian occupation of Rome.

It happens, as the French Ultramontanes ought to have known, that a good understanding with Italy at present implies a genuine reconciliation between Austria and Germany. The foresight of BISMARCK was never so conspicuously illustrated as in his anticipation that the victories of 1866 would ultimately terminate the chronic conflict of policy between Austria and Prussia. Until the Confederacy of 1814 was destroyed, the rivalry of the two great German Powers for supremacy in the Diet was inevitable and perpetual; yet, as the possession of Lombardy exposed Austria to the periodical risk of a French war, so a policy mainly directed to German interests weakened the monarchy by alienating the sympathies of Hungary. The cession of the Italian provinces, effected simultaneously with the compulsory retirement of Austria from the German Federation, while it terminated all risk of collision with Italy and France, prepared the way for the compromise with Hungary which was effected by the sagacity and determination of

Count BEUST. The loss to Austria was rather of serious liabilities than of valuable possessions; and as wounded susceptibilities have become partially blunted by the lapse of time, judicious Austrian politicians have become less and less disposed to cherish a barren feeling of resentment. The welcome offered to the King of ITALY represented, not only the final rejection of ecclesiastical supremacy, but deliberate condonation of the arrangements between Italy and Prussia which prepared the way for the struggle of 1866. Indeed the policy of the Italian Government was at that time so indirect and complex that Germany, rather than Austria, might resent the past, if it were not expedient to think of the present and the future. There is consequently no longer any reason for a separate alliance with France, either in support of the claims of the Pope or for the purpose of weakening the German Empire. The new-born friendship between the Emperor of AUSTRIA and the King of ITALY may perhaps be sincere, but it is politically more important that mutual good-will should be professed than that it should be really entertained. But for the foolish menaces of the clerical party in France, it is possible that the Italian Ministers might not have succeeded in persuading the King to cross the Alps for ceremonious visits to Vienna and Berlin. His own leaning to France is well known; but he is not disposed to sacrifice to sentimental considerations the interests of his Crown and the security of Italy. The act which the Archbishop of PARIS denounces has now received formal sanction.

At Berlin the King of ITALY was secure from the exhibitions of hostility which were attempted by the Ultramontane party at Vienna. The German Government is fully aware both of his understanding with NAPOLEON III. in 1866 and of his imprudent proposal to send a contingent to the aid of the French during the war of 1870; but statesmen have no disposition to indulge in idle recriminations. Germany and Italy have at present two common interests, as both are threatened by the intrigues of the Roman Catholic priesthood and by the restlessness of France. It has been the peculiar folly of Rome under the present Pope to oppose the measures which are most indispensable to the welfare of nearly every great European State. The temporal dominion of the Holy See might probably have been retained if the Pope had not, after the dissipation of his earlier illusions, deliberately set himself against the consolidation of the Italian Monarchy. Down to the present time, instead of recognizing the title which has been universally accepted by Europe, he still affects to believe that VICTOR EMMANUEL is only King of SARDINIA. When the Emperor of AUSTRIA was forced to concede representative government to his Western States, and to recognize the ancient Constitution of Hungary, the Roman Catholic hierarchy were encouraged to prefer insolent appeals from the Parliament to the Sovereign who had renounced his own pretensions to absolute power. The rebuff which the prelates then received has been followed by many additional warnings that the subordination of the State to the Church is at an end. One of the highest ecclesiastical dignitaries has lately been compelled, by the risk of incurring a heavy fine, to withdraw a circular in which he had instructed his clergy to refuse obedience to a legal mandate. The Prussian Government would have gladly maintained friendly relations with the Roman Catholic Church if the Pope and the clergy had been content to remain neutral in the struggle for German unity and in the consequent war with France. The retirement of the French garrison from Rome and the occupation of the capital by the Italians were incidental results of the war which had probably not been either contemplated or desired by the

Government of Berlin. The Pope and his French adherents have now contrived to provide the King of ITALY with a formidable supporter in the contingency of any conflict with the ecclesiastical party. Prince BISMARCK would not regard with indifference a French expedition to Rome; and, on the other hand, in the event of a renewal of the war between France and Germany, the Italians could scarcely fail to understand that their own independence and the unity of their territory depended on the success of those who have lately become their natural allies. No formal treaty will be required to secure the joint action of Powers which are exposed to a common enemy.

The Royal visits may perhaps have furnished an opportunity for discussing the course to be adopted by the different Powers on the approaching vacancy in the Holy See. The traditional custom by which three chief Catholic Powers were allowed to interfere in the elections at Rome has, through a change of circumstances, become obsolete. The Republican Government of Spain has ceased to profess adherence to the Catholic Church; nor would its title at the present moment be recognized either by the Cardinals or by foreign Powers. The Austrian Government is regarded with suspicion at Rome; and the more prudent members of the Conclave will not be disposed to accept the dictation of France. The electors will be concerned to maintain the predominance of Italian interests, while the majority will probably be hostile to the Italian Government. Rumours that the reigning Pope has taken measures for overruling the liberty of election are consistent with the arrogant and usurping temper which has led Pius IX. into so many dangerous innovations. The wishes of a deceased Pope have in former times been habitually treated with contemptuous disregard; but the ultra-clerical faction which is allied with the priests might probably take advantage of any pretext to defeat their temporizing or political opponents. If the freedom of election is openly violated, it is not improbable that the European Governments may refuse to recognize the successor of the present Pope. If no irregularity vitiates the election, the new Pope will have to decide whether he will come to terms with the Italian Government or retire from Rome. It is improbable that the present anomalous arrangement should survive the present Pope. The attitude of a voluntary prisoner would be too absurd a result of a new election. It is scarcely probable that the Italians will allow any Pope who may be chosen to exercise a shadowy sovereignty in the same city which is the seat of the national Government, and it is certain that a Pope who voluntarily leaves Rome will never be allowed to return. The obstinate perversity of the present Pope has brought the Holy See as a political institution to the verge of ruin; and his death will probably be the signal for grave disasters to the Church. The election of a dispassionate statesman might perhaps postpone the catastrophe.

THE DOVER ELECTION.

IT is not easy at this moment to say whether there is most danger of over-estimating or of under-estimating the strength of the Conservative reaction. On the one hand it is true that, though the Opposition have gained a good many seats, they have a far larger number to gain before they can count upon having even a bare majority in the House of Commons. It is true further that no amount of partial elections can constitute a perfectly trustworthy guide to the gross result of a general election. Partial elections are almost always more favourable to the party in Opposition than they are to the party in power, and the probability of their being so increases in proportion to the strength of the Ministerial majority. If Mr. GLADSTONE had a majority of five or ten votes, every election would be important, and the strength and devotion of the Liberal party in the constituency would be subjected to a conclusive test. But when his majority is still amply sufficient to carry him safely through every really important division, there is no paramount need for the Liberal party to be up and doing whenever a vacancy happens to occur. Even if the Conservatives do win the seat, it is easy to say that it can make no practical difference, and this argument is one which, when used by an idolized and discontented supporter, canvassers find it hard to meet. At a general election there is no room for reasoning of this sort. The majority has still to be created, and every constituency feels that it rests as much with it as with any other to determine of what complexion it shall be. It is quite conceivable,

therefore, that many of the recent Conservative victories may, when a general election comes, be turned into Conservative defeats. On the other hand, though there may not be much meaning in the number of these victories, there is something which it is hard not to regard as significant in their unbroken regularity. If the Conservative gain were merely a gain on the balance of elections, it would not be at all surprising; but it is certainly strange that one election after another should thus go in their favour, and that none be found to go against them. It was natural that, in the first instance, those who offered these partial elections as a sample of what a general election would be should be asked to prove that they were a fair sample. But when time after time the hand is dipped into the sack, and the same kind of sample comes out, it is necessary for those who deny that these partial elections are a fair sample of what may be expected at the general election to show cause for their disbelief. We do not say that this time has come for the Liberal party, but it certainly looks as though its arrival could not be long delayed. This may perhaps account for the impression that one of the pending elections—some say Bath, and some Taunton—will be accepted by the Ministry as a test of the general feeling of the country, and will determine the course to be pursued.

It is not clear, however, how much of the apparent reaction in favour of Conservatism is due to the unpopularity of the Ministry, and how much to the sudden relaxation of party ties which has necessarily resulted from the Ballot. This relaxation would, under any circumstances, have been more apparent in the supporters of the Ministry than in the supporters of the Opposition. The Opposition leaders have had no recent opportunity of making themselves disliked. They have had no measures to pass, and no places to give away. Consequently no one has been aggrieved by their legislation, or irritated by their distribution of patronage. The Ministry, on the contrary, have to contend against both forms of unpopularity, and after five years of office it would be a miracle if these causes had not availed to alienate many of their supporters. Formerly alienation did not necessarily mean desertion; now it almost always will mean it. Formerly a voter had to consider not only how he should answer to himself for his vote, but how he should answer for it to his neighbours. Now he can vote against his party and nobody be the wiser. He can hold his tongue and refuse as a matter of principle to answer questions; or, if that course is too suggestive, he can allow it to be supposed that he has voted as he always voted before. Either way there is no polling-book to betray him. The particular circumstances under which the Ballot came into operation made it peculiarly likely that the Liberal voters would run wild as soon as they could do so without detection. The great measures which had been carried by such triumphant majorities in the earlier years of Mr. GLADSTONE'S Administration were calculated to excite secret discontent as well as open enthusiasm. There must have been many good Protestants among the Liberal electors who only half liked to see the Irish Church disestablished and the equality of Popery and Protestantism proclaimed in Ireland. There must have been many among the middle-class voters that sent up men pledged ten times over to support the Government, who in their hearts felt more sympathy with the landlords whose legal rights were invaded by the Irish Land Bill than with the tenants whom the PRIME MINISTER was resolved to emancipate. The Ballot has given these uneasy consciences an occasion of relieving themselves. They can punish the Government by voting against it without the annoyance of acknowledging that their dissatisfaction has its source in the very measures which they instructed their representatives to support.

The Dover election has a particular interest of its own apart from its bearing on the prospects of the Government. Mr. FORBES was something more than the Liberal candidate; he was in a special sense the Railway candidate. This latter capacity suggests two reasons why even Liberals may be glad that he has been defeated. The first is that the Railway interest is already a great deal too strong in the House of Commons. It is true that last Session it was unable to defeat the Railway Traffic Act Amendment Bill; but in this case it had arrayed against it the whole trading community. Every merchant was interested in getting his goods conveyed with reasonable speed, and in having the means of knowing beforehand what the total cost of their carriage would come to. The points on which the Railway interest is so strong are points affecting passengers rather than goods. Railway travellers have no organisation and no means of making

their complaints listened to in Parliament. When they are maimed or killed they have a kind of rough justice dealt out to them under Lord CAMPBELL'S Act; but if they ask to be protected against accidents instead of having damages awarded them in consideration of accidents, the Legislature is consistently deaf to their prayers. So long as this state of things continues we have no wish to see any more railway directors returned to Parliament. No matter what their politics or their professions may be, they are sure to be found on the same side whenever the railway autocracy is threatened. Why Railway Companies should resent being compelled to take precautions against accident which, if they read their interests aright, they would take without being compelled, it is not easy to say. But, whatever may be their reasons for resisting, there is a wonderful unanimity about their resistance. Be they Liberals or Conservatives, they are always to be found in the same lobby, when a Railway Bill is under discussion. And as it is to be hoped that one result of the extraordinary number of railway accidents which have taken place this summer will be the introduction of a Bill to subject the Companies to a more stringent control than at present, we are heartily glad that Mr. FORBES has not been returned to record his vote against it.

The second reason for satisfaction at the result of the Dover election is the fact that it involved the defeat of a candidate who had had recourse to a form of persuasion which, though it does not come within the legal definition of corruption, is quite as mischievous in its character and consequences as anything that is called corruption in an Act of Parliament. Whatever effect the Ballot may have upon bribery of individuals, it seems likely to increase bribery of constituencies. To give 5l. to A. or B. with no positive assurance that the vote you have bought and paid for will not after all be given to your opponent, may now perhaps be accounted a reckless form of expenditure. But to promise 1,000l. to the borough in the shape of local improvements is more likely to catch votes under the Ballot than under a system of open voting. The consideration for the proposed outlay is the return of a particular candidate, and unless this return is secured the money will not be paid. Consequently every elector who hopes to benefit in his own person by the advantages promised to the constituency has a direct interest in voting for this candidate, and the Ballot enables him to consult this interest without the annoyance of avowing that he prefers his pocket to his principles. It might have been difficult for a Liberal to vote for a Conservative, or for a Conservative to vote for a Liberal, merely because the candidate in whose favour this sudden conversion had been wrought had promised to build a new dock or open a new railroad. Enthusiastic politicians would have called the change by some harder name than conversion, and to be known as a turncoat among his friends may do a man more harm than the promised improvements could do him good. The Ballot spares the voter this inconvenience, and enables him to consult his wishes by his vote at the same time that he consults his character by his talk. It is to be feared that the experiment will be tried with greater success in other instances, but it is some satisfaction to find that it has failed in the case of Dover.

THE CIVIL WARS IN SPAIN.

IN one of his late speeches Señor CASTELAR expressed surprise and regret at finding that the Cantonal insurrection had thrown discredit on the principle of Federalism. It has generally been thought that NERO and DOMITIAN furnished an instructive comment on the tendencies of unqualified despotism; and all but the extreme advocates of democracy are inclined to doubt the merits of a revolution which culminated in the Reign of Terror. The division of an ancient Monarchy into thirteen partially independent States, to be still united by a Federal bond, seemed to the majority of Spaniards, and to nearly all foreigners, a questionable experiment. In the imagination of CASTELAR and his Republican allies the lines of division were not to exceed a certain breadth, and the connecting link was by some mysterious process to be at all times made sufficiently strong; but the enthusiasm which assumed the condition of uniform prosperity, and provided against neither excess nor failure, provoked astonishment rather than admiration. The only instruments for the accomplishment of the task were revolutionists of an anarchical type, and the only precedent for the undertaking was supplied by the Commune of Paris.

The Uncompromising faction had, before the fall of the Monarchy, openly proclaimed their intention of subverting society; and with a premature candour they had by anticipation denounced CASTELAR and his friends as retrograde traitors. As he lately told the Cortes, F. MARGALL, who was one of the principal leaders of the party, and CASTELAR himself, entertain different political opinions; and he was probably aware that some of his colleagues shared with the enlightened SÚÑER the conviction that orthodox Republics of the extreme socialist and atheistic faith were entitled to perpetual impunity, even when they rose in armed rebellion. CASTELAR himself has proved that he is neither a blind fanatic nor a dishonest intriguer; but, in common with other Spanish politicians, he is incapable of tolerating forms of government which happen not to suit his preconceived notions of perfection. If he had reflected calmly on the condition and prospects of his country, he would have found himself nearer in political opinion to the supporters of the Monarchy than to the wild theorists and unprincipled adventurers who form the bulk of the Republican party. There are and there have been orderly Republics, and the greatest which now exists is constituted on the Federal system. The craziest speculator would scarcely dream of establishing royalty in the United States, although American journalists in want of an exciting topic have lately suggested that General GRANT is about to imitate JULIUS CÆSAR. A Republic in Spain could only mean the temporary supremacy of the rabble which called itself Republican.

The renovators of society, with every disposition to extravagance, have for the most part proved themselves incapable even of discharging with efficiency the paramount duty of insurrection. At Seville, at Malaga, and at Granada their weakness was found equal to their wickedness, although the forces of which the Government disposed were inadequate to overcome serious resistance. It is unlikely impossible to guard against the incessant renewal of disturbance and danger. It is announced one day that a Socialist municipality has been elected at Cadiz, and on another that deputies from Barcelona have arrived at Madrid with demands for the establishment of Cantonal independence in Catalonia. In general it may be assumed that the thoroughgoing or Uncompromising Federalists are everywhere ready to rebel, if only they can be guaranteed against the necessity of fighting. For some time past Carthagena alone has maintained the cause of provincial independence, and it is now said that the insurgent leaders are treating with the Central Government for an amnesty or a compromise. In the meantime the rebel leader is allowed to publish a newspaper at Madrid, in which he naturally defends the principles which he is more practically asserting by civil war. The rebel ships of war are still cruising along the coast to levy contributions; and a few days ago the town of Alicante was only saved from an unprovoked bombardment by the protests and threats of the Admiral commanding an English squadron. As it is probable that the Spanish Government may again require the good offices of English naval commanders, it is satisfactory to learn that the Ministers have acknowledged, by the release of the vessel and crew, the irregularity of the capture of the *Deerhound*. The threatened bombardment of Alicante was perhaps the most extravagant illustration which has yet occurred of the prevailing anarchy. That every Canton should be subject to invasion by the forces of every neighbouring community is perhaps a logical result of the Federal doctrine. During the middle ages the same kind of Federalism prevailed in many parts of Europe, though even a feudal baron would, if possible, devise some plausible excuse when he attacked his neighbour's castle for the purpose of collecting money and provisions. The Welsh potentate, according to the poet, thought it better to carry off the valley sheep than the mountain sheep, because they were fatter; and accordingly he made an expedition which resembled in its motives the cruise of the *Numanceia* and her consort. It would seem that the Government of Madrid is unable to reinforce the besieging army, and perhaps the insurgent leaders may think it prudent to negotiate while the weakness of their adversary still enables them to treat on equal terms.

CASTELAR and his colleagues seem at last to understand that the disorder which they and their adherents have produced is incompatible with the liberty which they have spent their lives in proclaiming as indispensable. The measures adopted by the Minister seem judicious and

therefore justifiable, though they are without exception inconsistent with the cherished principles of his life. The first business is to get rid of the Cortes which was the sacred product of universal suffrage. The majority has with difficulty been persuaded to vote for a prorogation till February, when it will probably not be thought necessary to reassemble for another adjournment. The Cabinet will in the meantime provide as best it can for the preservation of public security, and for the prosecution of the Carlist war. The most necessary object is the formation of a disciplined army; but in issuing decrees for enlistment and for calling out reserves, the Government appears to be thus far twisting a rope of sand. If obedience can by any means be secured, there seems no objection to the Ministerial decisions. The constitutional guarantees throughout Spain are suspended, as they have always been suspended when there was any room for their operation. Every Spaniard above the age of eighteen must provide himself with a passport before he moves from home; and all authorizations to carry arms are withdrawn. The newspapers are forbidden to publish incitements to insurrection, or any but official news of the movements of troops. The Ministers have unlimited authority to raise funds for the public service either by taxes or loans. In general it may be said that the Government will act at its discretion; and there can be no doubt that moderate and patriotic Spaniards will approve of the assumption of absolute power. Unfortunately authority depends upon force; and it seems that the recruits who are raised either refuse to obey the requisition or desert on the first opportunity to the Carlists or to the Socialist insurgents. The party of which the present Ministers are the most eminent chiefs is principally responsible for the dissolution of military discipline. They are now ready to adopt the only methods of suppressing anarchy; but they might as well have allowed their predecessors to save them the trouble. The conqueror in the old story proposed to himself to live at home at ease as soon as he had made the triumphant circuit of the world. The philosopher replied that, on the whole, it would perhaps be simpler to stay at home instead of starting on his expedition. Perhaps the best proof of CASTELAR's sincere patriotism is his expressed determination to employ against the Carlists and insurgents generals and officers of all political parties. If it is true that he has rejected an offer of service from GARIBOLDI, he has had an opportunity of displaying his good sense. CASTELAR himself belongs, or belonged, to the sect of MAZZINI, which is regarded as heretical by the militant Republic according to GARIBOLDI.

It is difficult, even with the aid of an intelligent English newspaper Correspondent, to trace the progress of the Carlist campaign. Whenever a skirmish takes place, the Royalists and the Republicans publish diametrically opposite narratives of the result, agreeing only in a trifling estimate of the losses on either side. A short time ago the Carlists failed in a scheme for blockading a considerable Republican force in Tolosa, nor have they lately claimed any considerable advantage. On the other hand, it is asserted that they have now upwards of forty thousand men in arms, and some of their troops are both earnest in the cause and tolerably disciplined. It still seems probable that their achievements will be confined to a practical illustration of the principle of Federalism in the Northern provinces, although they may count a few partisans in the centre and the South. The monstrous alliance between the Catholic Royalists and the extreme Socialists seems to be limited to a few districts, and probably it is directed only to military objects. Perhaps the most formidable enemies of the Republic will be hereafter found in the party which has withdrawn itself from public action since the abdication of King AMADEO. Nearly all the supporters of Monarchy, with the exception of the Carlists, are now agreed in the choice of ALFONSO, the son of ISABELLA, and they have a good excuse in the age of their candidate for not prematurely urging his claims. Notwithstanding the eloquent commonplaces in which CASTELAR still indulges, it can scarcely be doubted that for many years to come all respectable Spaniards will regard the Republic with unqualified aversion. The inglorious memory of several reigns will be effaced by the fresher recollection of universal confusion and helplessness resulting almost exclusively from the experiment of a Federal Republic.

THE CANADIAN SCANDAL.

THE charge against the Canadian Ministers was one of those accusations which almost prove themselves, unless they are met by a summary denial. When Sir JOHN MACDONALD declined to state whether his published correspondence with Sir HUGH ALLAN was spurious or authentic, he virtually admitted his guilt. That a Prime Minister should in the midst of a general election receive money for political purposes from a public contractor was an intolerable scandal; but as the inculpated members of the Cabinet still asserted their innocence, it was proper to wait for further evidence before a definite judgment was passed on their conduct. It now appears that Sir JOHN MACDONALD admits the receipt from Sir HUGH ALLAN of 9,000*l.*, to be applied to the purposes of the election; but he still contends that the payment, or the understanding on which it was made, formed no part of the consideration for the concession of the Pacific Railway contract. It is barely possible that the Canadian Ministers may have persuaded themselves that they would have given the contract to Sir HUGH ALLAN even without receiving a pecuniary equivalent; but no quibble can explain away the motive of the contractors for paying a large sum of money to Sir JOHN MACDONALD and his associates; and it is not disputed that they received the expected consideration. Sir HUGH ALLAN himself may be believed when he asserts that his own objects were exclusively commercial; and that, except as far as the railway project was concerned, he took no interest in the result of the election. It is perfectly evident that he intended the payments to operate as a bribe; and that his expectations were fully justified by the event. The transaction would have been baser, but not more defensible, if the recipients had applied the whole of the money to their private purposes. There are degrees in personal and political guilt, and it is more criminal to obtain a corrupt personal profit than to secure by the same methods the success of a party; yet it must not be forgotten that the return of a Ministerial majority implied the maintenance in lucrative office of the persons who had sold a public interest committed to their charge for the price with which they purchased their own continuance in power. The pretence that the transfer of large sums of money bore no relation to the grant of the contract is too flagrantly absurd to deserve refutation. The accused confess the material fact, though they dispute an inference as inevitable as if it were a legal presumption.

The Commission to which so much objection was raised seems to have done its work fairly; or rather it had little to do. The acts of the Ministers were too distinctly proved to admit of denial; and consequently the inquiry seems to have been shortened by confession. It is said that the Chairman of the Commission was himself a party to the corrupt transaction; and it is therefore not surprising that the promoters of the Parliamentary inquiry should have refused to take part in the substituted proceedings. The rapidity and facility of the investigation seem to prove that the charges were unnecessarily and improperly withdrawn from the jurisdiction of the House of Commons. Although it appeared that a Committee of the House had, through an oversight in the Constitutional Act, no power to administer oaths, it was for the House itself to determine whether sworn testimony was indispensable. Before impeachment became obsolete in England the charges which were afterwards to be preferred before the proper tribunal were prepared by Committees of the House of Commons on statements which could in no case be verified by oath. It must have been wholly immaterial whether Sir JOHN MACDONALD swore to the admission that he had received a large sum of money for purposes of corruption from a Government contractor. If the House of Commons had declined to act on his confession, the majority would have proved themselves accomplices of his guilt; and although they aided in postponing his conviction, it is unreasonable to assume that they would have deliberately adopted the responsibility of his conduct. The ease with which the main charge has been proved also throws a doubt on the wisdom, though not on the good faith, of Lord DUFFERIN's strict adherence to the technical rules of Parliamentary government. In general it may be said that the Governor-General of Canada is bound to act on the advice of his Ministers, even where he may disapprove of their policy; but fraud, which vitiates all contracts, may also be regarded as introducing an exception to constitutional maxims. If the Ministers are themselves guilty of corruption, they cease to represent the will of Parliament and of the community; and the repre-

representative of the Crown is bound himself to provide for the welfare of the Dominion. It would apparently not have been difficult to ascertain from the accused Ministers themselves that they had received payment for a public concession, and that the money had been employed for the purpose of influencing the constituencies. If Lord DUFFERIN were personally satisfied of the guilt of the accused persons, he might well have insisted that the facts which were known to himself should be at once submitted to the judgment of the House of Commons.

The true reason of Lord DUFFERIN's assent to the prorogation may perhaps have been the difficulty of procuring the attendance of members from distant parts of the country, who had not expected that Parliament would meet for the despatch of business. It will now be his duty to dismiss his Ministers, unless they anticipate his interference by resignation; and he will necessarily select their successors from the ranks of the Opposition. If the majority of the House of Commons refuses its confidence to new Ministers, they will have an irresistible claim to a dissolution, although the present Parliament has been elected within the year. The expenditure of a large sum by Sir JOHN MACDONALD and his associates in securing the return of themselves and their supporters throws a doubt on the claim of the present House to represent the opinion of the country. With or without a new Parliament, the party which has long been excluded from power will probably enjoy office until the memory of the recent scandals has become partially obliterated by time. There is unfortunately little reason to hope that the public administration will be improved by the necessary change. The assailants of the present Government were as loud and as bitter in their denunciations of Sir JOHN MACDONALD and his colleagues before the late exposure as since they have obtained an unexpected triumph. Canada has for some years possessed the great advantage of a permanent body of rulers who had time to acquire the art of Government. It seemed that a school of statesmen had gradually been formed which might transmit to the next generation sound traditions of policy and government. The offence of those who have betrayed their trust is greatly aggravated by their sacrifice of public esteem and respect. The Canadians took a reasonable pride in contrasting their conspicuous politicians with the intriguers and adventurers who sometimes exercise power in the neighbouring Republic. They will now be forced to confess that they have a Pacific Railway scandal of their own, as much graver than the *Crédit Mobilier* fraud as the office of Chief Minister of Canada was more important than the sinecure function of Vice-President of the United States. The indignation which has been expressed by the organs of the Canadian Opposition may perhaps have been perfectly sincere; but it will be in some degree attributed to factional motives. It is satisfactory to learn that a section of the Conservative majority supported the motion for Parliamentary inquiry into the conduct of the Ministers. The remainder of the party may possibly have believed in their innocence, or may have thought that they were entitled to the benefit of a doubt.

It is not a little annoying that three or four of the practitioners of corruption should have borne titles which were properly thought to imply a fit recognition of colonial distinction. Sir JOHN MACDONALD, the late Sir GEORGE CARTIER, and Sir HUGH ALLAN were designated as fit candidates for the favour of the Crown by the local position which they owed to the confidence of the Canadian Parliament and of the constituencies. Sir FRANCIS HICKES had been engaged beyond the limits of Canada in the service of the Crown. English Secretaries of State cannot be accused of trafficking in the colonial honours at their disposal for the purpose of rewarding either party services or subservience to the Home Government. The most conspicuous politicians were selected for decoration in the reasonable hope that titular distinction would both promote their self-respect and gratify the community to which they belonged. In England a title may sometimes be granted on insufficient grounds; but it is rarely liable to be degraded by the personal unworthiness of the recipient. It fortunately happens that the Imperial Government has few lucrative contracts to dispose of, although its agents may sometimes blunder, as in the arrangement for the postal service of Zanzibar. The possible profits to be made from the concession of the Intercolonial Pacific Railway were too much for the virtue of Ministers on one part and of speculators on the other. The English guarantee probably

increased the eagerness of Sir HUGH ALLAN and his competitors to obtain the opportunity of dealing with large sums of money. It remains to be seen whether the Parliament of the Dominion may not rescind a contract which has been secured by corrupt means. The English promise of a guarantee will not be affected by any irregularity in the proceedings. Between England and the Dominion valuable consideration was given for the guarantee, and it would be irrelevant to object that the Canadian Commissioner at Washington was the Minister who afterwards received money on account of the concession of the railway contract. The sole duty which devolves on the Home Government in consequence of the exposure is to form a judgment on the course which has been adopted by the GOVERNOR-GENERAL. If Lord DUFFERIN has in a difficult case inclined too much to a strict construction of his constitutional duty, the purity of his motives will certainly not be questioned.

THE ROYALISTS AND THE COUNT OF CHAMBORD.

FOR the last few days French politicians have been chiefly occupied with considering and interpreting the account of the interview between MM. MERVILLEUX-DEUVIGNAUX and DE SUGNY and the Count of CHAMBORD which appeared in the *Times* of Tuesday. The first remark that suggests itself as to this interview is that the deputies who conducted the negotiation on behalf of the Royalists both belong to the Extreme Right. Considering that the conditions offered for the Count of CHAMBORD's acceptance, if any are offered, will be framed by the moderate section of the party, it is significant that this section should not have been represented in the deputation. The Extreme Right has no difficulty about accepting HENRY V. upon any terms, or upon none; why then should the Extreme Right go to Frohsdorf to ascertain what terms HENRY V. is likely to agree to? Supposing that in England certain moderate Liberals were considering whether they could accept Mr. DISRAELI as their political chief, they would hardly be satisfied if Colonel TAYLOR and Mr. CHARLEY went to Hughenden, and brought back consoling assurances that everything would be arranged to their satisfaction. Yet the differences which part extreme Conservatives from moderate Liberals are a mere nothing by the side of the gulf which separates the partisans of Divine Right from the partisans of Constitutional Monarchy. Obviously the only explanation is that the Count of CHAMBORD could not be trusted to receive any but deputies of his own way of thinking. A representative of the Right Centre would either have found him obstinately silent or fatally frank. He would either have refused to make any statement of his intentions, or he would have made one which must have broken up the Fusion.

The expedient of entrusting the negotiation to deputies of the Extreme Right was so far successful that the Count of CHAMBORD consented to speak, and spoke with great reserve. He had four-and-twenty hours given him to consider what he should say; and if it was his object to make his meaning obscure, he certainly used the interval well. On the first day, it seems, only MM. MERVILLEUX-DEUVIGNAUX and DE SUGNY spoke. They disclaimed all intention of bringing an ultimatum, and directed the Count's attention to the religious question, the Constitution, and the Flag. On the second day the Count of CHAMBORD spoke upon all these three points. He began by thanking the deputies for not bringing an ultimatum; the truth no doubt being that, had they done so, he would have felt bound to reject it. As regards the religious question the Count's language was fairly satisfactory. There has never been any solid reason to fear that a restoration would involve France in a war with Italy; indeed we have no expectation that the Count of CHAMBORD would even wish to be allowed to involve the destinies of France in any war which was not promising as well as sacred. As regards the Constitution his meaning is less clear. Apparently he intends to accept the Charter of 1814, "adapted to present circumstances, and carefully considered with the Assembly," as the basis of the contract between himself and his subjects. Into this charter, however, he wishes to introduce certain ideas of his own with regard to universal suffrage and decentralization. The Count's views upon universal suffrage may probably be inferred from those entertained by his friends in the Assembly. Like them, he is anxious to get rid of the fact; like them, he is afraid to get rid of the name. How to retain a system under which

every man, has a vote, and yet modify it so as to prevent as many as possible from voting, has for some time past exercised the ingenuity of French Conservatives. As to decentralization, it is hard to say what the Count thinks, because on this subject French politicians think so differently, according as the central power is in their own hands or in the hands of their opponents. Two years ago the Right in the Assembly were bent on giving a large share of independence to local assemblies. The men who voted for even a stronger Decentralization Bill than the Bill actually passed are now anxious to silence the Departmental Councils and to make every Prefect absolute in his own district. Upon the question of the Flag the Count of CHAMBORD is described as being loth to acknowledge its full importance. The *Times*' telegram does not make sense in this place, since the Deputies are represented as saying that they believed an arrangement could be come to, provided the Count of CHAMBORD would declare that it was the present Assembly and not another which should make the Monarchy; and then as "replying" to themselves that the present Assembly will never make the Monarchy without the tricolour. In answer to this the Count appears to have simply said "I know that." Whether he cherishes any secret hope that another Assembly will be more accommodating, or has really brought himself to consent to the tricolour being retained as one at least of the French flags, is not clear. From the account, however, of a meeting held on Thursday, it appears that the Royalists believe the latter to be the true version of his thoughts.

According to the *Times*' Correspondent, the Conservatives present at this meeting "unanimously felt that the time of 'absolute resolutions had passed; that the footing of 'mutual concessions must be advised resolutely and with 'one consent; and that the Conservative sections must 'henceforth, whatever happens, be united in political 'sentiments and efforts." Neither the truth nor the pertinence of these conclusions is open to question. But in matters of this kind it is one thing to resolve and another thing to perform. No doubt if the Count of CHAMBORD could be brought to admit that the time for absolute resolutions has passed, and that he must accept the Crown upon reasonable conditions, a very great advance would have been made. In point of fact, the Count of CHAMBORD would have taken rank as an Orleanist, and the Count of PARIS, from being simply his heir, would have become his model. But is it quite so certain that the Count of CHAMBORD has been brought to this point of pliability? There is not much trace of it in the report of what he said to MM. MERVEILLEUX-DUVIGNAUX and DE SUGNY. All that is to be found there is a declaration that he stands by the Charter of 1814; that he has no intention of granting any other terms or of accepting any other terms. An absolute resolution in favour of the Charter of 1814 may be just as ill timed as any other absolute resolution. So, again, as regards mutual concessions. It is easy for the Royalist deputies to recommend them to one another, but which of them will undertake to recommend them to the Count of CHAMBORD? What is the precise distinction between a recommendation to make a concession and an ultimatum? Of course, if the Royalists are in the last resort prepared to accept the Count of CHAMBORD as their Sovereign without conditions, their suggestions of concession will be perfectly inoffensive; but then it may be taken for granted that the mutual concessions talked of at the meeting will turn out to be concessions wholly on one side. If, on the other hand, they are to be really mutual, really framed on the principle of give and take, they become dangerously like an ultimatum. We, the Royalists will say, are prepared to make these sacrifices, if you are prepared to make those sacrifices. If the Count of CHAMBORD simply answers "I am not prepared," what course are the Royalists to take? They may turn their conditional promise into a categorical one, and say, "We are 'prepared to make these sacrifices, whether you are prepared 'to make any sacrifices in return or not;" but in that case what becomes of the mutual element in the transaction? Or they may say that, if the Count of CHAMBORD perseveres in his refusal, they cannot take him for their King; but in that case what is to prevent the Count of CHAMBORD refusing the offer altogether?

With all these difficulties ahead, the Conservative sections may find it less easy than they think to be "united 'in political sentiments and effort," no matter what may happen. It is true that the Orleanists have made an heroic effort to forget that they ever professed to be the

maintainers of a given set of political principles. They have done penance in the person of the Count of PARIS for their presumption in raising their hand against the Lord's Anointed three-and-forty years ago. They have consented to treat the Revolution of 1830 as a crime which cannot indeed be wiped out from men's memories—it must remain as an accident of history—but which must no longer influence their actions. They have ceased to stand idle in the political market-place, have hired themselves out as the Count of CHAMBORD's servants, and are now humbly hoping that, when he pays them their wages, they may get as much from his bounty as those who have borne the burden and heat of the day will get from his justice. But suppose that their principles turn out after all to be scotched and not killed; suppose that at the eleventh hour that dislike of absolute government which they and their new allies had alike believed to be dead within them should assert itself with even a short-lived vigour, what are the chances of unanimity from that moment? There is something inexpressibly childish in the determination to treat principles as nothing and names as everything which now characterizes French Royalists. The best thing we can wish for them is that they may turn out to be less prepared than they profess themselves to exchange the substance of Conservative freedom for the shadow of Monarchical order.

LEGISLATION IN OVER-DOSES

THE electoral Fates would appear to be still adverse to the Ministry, and the rejection of the Liberal candidate at Dover only confirms the undeviating verdicts of the constituencies which have been consulted during the last few months. It is of course impossible to say how far isolated elections can be accepted as an adequate representation of the opinion of the whole country; but even the most devoted and fanatical supporters of the Government are at last obliged to admit that there is something ominous in this unbroken continuity of defeat. It can no longer be denied that the Ministry is unpopular; it would be childish to attempt to do so in the face of what is constantly happening, and therefore the fact is acknowledged. But of course there is room for an endless variety of conjecture as to the causes of this unpopularity. There is only one point upon which Ministers and their friends appear to be agreed. If the country does not like the Ministry, it must certainly be the fault of the country. Mr. Lowe has suggested that people were silly enough to be tired of always hearing the same men called by the same official names; but it does not appear that the roses of the Cabinet have been found to smell more sweetly under their new nomenclature. The more pious adherents of the Government have been driven to seek an explanation of this melancholy crisis in the mysterious depravity of the human heart. In no other way can they account for the blindness and ingratitude of a generation which has thought to itself, even for a moment, that it was possible ever to have had enough of Mr. GLADSTONE. The legislative achievements of the Government supply the refrain of the chorus of remonstrance and reproach. This was, indeed, the great point of Mr. Lowe's recent vindication, and it had previously been used for a similar purpose by Lord KIMBERLEY and Lord HARTINGTON. The parrots of the party have naturally caught the note. Every day we are called upon to recollect and admire the wonderful Acts of Parliament which have been manufactured by Mr. GLADSTONE and his colleagues. It is an imposing list. There is the Irish Church Act, and the Irish Land Act, and the Ballot Act, and the Education Act, the Act for the Reorganization of the Army, and the Judicature Act. These are certainly things about which there can be no mistake. You have only to turn up the volumes of the statutes to find them in plain black and white. You can count up the number of clauses or measure off the schedules with a piece of tape, or test the bulk or weight of these great measures in any other way. It is clear that the most reckless and unscrupulous opponents of the Ministry cannot get rid of facts like these. The Acts are undoubtedly there, and it may be admitted that, taken for what they are—that is, simply for Acts of Parliament—they are on the whole very pretty specimens of an ingenious industry. A Government that has had a hand in the production of these measures may fairly take credit for its handiwork, and is entitled to appeal to its customers, in the stereotyped language

of the shop circular, for future favours. The getting-up of big Acts of Parliament is the speciality of the present Cabinet, and it is right that this should be remembered when work of this kind happens to be wanted. But, admitting all this, it does not quite prove the case which the advocates of the Government are anxious to establish—namely, that in making these formidable additions to the Statute-book, the Ministers have fulfilled all the ends of government, and ought now to be rewarded with the permanent administration of affairs.

There are two ways in which the claims of the Government on this account may be examined. First, we may take the Acts themselves, looked at simply as Acts—that is, as so much documentary planning and scheming, as shadowy forms which have to be invested with substance and vitality, as, in fact, so much imaginary government on paper. From this point of view the Acts vary in quality; but it may at least be said that in some shape most of them would probably have had to be passed sooner or later, and that there are none of them which anybody would now propose to repeal. The Licensing Act can hardly be considered a masterpiece of legislative lucidity and precision; and the measures dealing with the Army and the Judiciary are, of course, simply blank forms waiting to be filled up. But it is the Irish Acts upon which the Government seems to pride itself most, and it is worth while to test their merits. Mr. Lowe has described the amazement with which he looks back on the hardihood of the little knot of middle-aged and elderly gentlemen of whom he was one, in resolutely setting themselves to redress by legislation all the grievances of the day. What the Government actually did was to throw into a legislative form, with regularly numbered clauses, a series of proposals which had been undergoing agitation for a great many years previously. Borrowing a hint from the peculiar financial system of the Second Empire, Mr. GLADSTONE applied a popular vote which he had obtained for one purpose to a variety of other purposes upon which it was not thought necessary to take the opinion of the constituencies. It would have been impossible for any Government to hold office without attempting to deal with the question of the Irish Church, nor could the relations between landlord and tenant in the same country have been left indefinitely without some sort of readjustment; but the precipitancy with which the second of these measures was hurried on after the first, and the unfortunate arguments by which both were justified by the Minister, as a necessary concession to a rebel conspiracy, tended rather to encourage wild desires and revolutionary menaces than to promote social harmony and contentment. In both instances the Government unhappily excited expectations which it has been unable either to satisfy or to dispel. The priests imagined that Ireland was henceforth to be governed through them, and the peasants thought they were about to be made proprietors of the soil. The charge against the Government is not that the Acts were bad in themselves, but that they were promoted in such a way as to neutralize the good effects which might have been reasonably anticipated from cautious legislation. The people of Ireland have been led to believe that they have only to make their demands in a sufficiently threatening tone to get them instantly conceded; and the Home Rule movement is simply the corollary of Mr. GLADSTONE's oratorical flourishes about governing Ireland according to Irish ideas. Nor have the mischievous consequences of ecstatic and sensational legislation been confined to Ireland. The grounds upon which a desperate remedy was applied to an exceptionally wretched state of affairs were unfortunately stated with such reckless breadth as to afford encouragement to other classes of Socialist agitators; and, while the Irish are dissatisfied because their wild dreams have not been realized, the inhabitants of the rest of the United Kingdom are perhaps more reasonably disappointed at the melancholy results of messages of peace. It may have been absurd to expect that Ireland would at once be made prosperous and contented as soon as certain Parliamentary forms had been gone through; but the Government is responsible for fostering the delusion.

The chief reason of the unpopularity of the Ministry is, we believe, simply that people are disgusted with the fussy, hysterical, blatant way in which the business of the country has been transacted. Everything has been done with an eye to stage effect, and to what in theatrical slang is known as "bringing down the house." Legislation is the most showy part of Ministerial work, and upon this the

Cabinet concentrated its whole attention. The passing of great measures in a glow of heroic exaltation was assumed to be the chief end of government; and Ministers laid themselves out to dazzle and astonish the world by their wonderful legislative feats. As a histrionic exhibition the performance has been remarkable, but, tested by practical results, it has not been found to be a very satisfactory form of national administration. The apologists of the Ministry affect to believe that their opponents are anxious to put a stop to every sort of reform, and to keep things exactly as they are. The fact that all the great measures of the Government have been acquiesced in by the Opposition, which in some cases has even rendered important assistance in bringing them into shape, is a sufficient proof that the general objects of those measures commanded approval. The truth is, as we have already said, that it was not the measures themselves, but the way in which they were pressed on all at once, in violent haste, and with a reckless disregard of every sort of interest that happened to come in the way, that produced resentment and distrust. The question, says Mr. GLADSTONE'S organ, is between ordered advance and political stagnation. In reality it is a question whether the country prefers gymnastic exercises to steady, business-like work. It is believed that the administration of affairs would be more satisfactorily accomplished if it were conducted quietly and soberly, with a view rather to solid and permanent results than to mere personal display and dramatic sensations. The country, in short, is sick of convulsive statesmanship, and the chronic alcoholism of politics. There is also a natural reaction from that superstitious faith in the magical virtue of Acts of Parliament which it has been the aim of the present Ministry to cultivate. In every society there are always plenty of men like the Abbé SIÈYES, who can sit down in a back room and draw up a pretty set of rules for the adjustment of all human relations. It is when the executive authority comes into contact with human nature out of doors that the difficulties of government begin, and that a demand is made on the higher qualities of statesmanship. And it is in this respect that Mr. GLADSTONE and his colleagues have been tried and found wanting. The multiplication of Acts of Parliament may indeed be regarded as a proof of weakness rather than of capacity. The skilful physician is known by the simplicity of his remedies.

PROFESSOR SULLIVAN'S APPOINTMENT.

THE appointment of Professor SULLIVAN as President of the Queen's College at Cork would not under ordinary circumstances have called for any remark. A man of great eminence both as a scientific investigator and as a teacher has received well-deserved promotion, and the Government have made a highly commendable use of their educational patronage. Both these facts are satisfactory in themselves, but happily they are not of sufficiently rare occurrence to make the text of an article. Professor SULLIVAN's appointment has, however, another aspect in which it becomes exceptionally interesting. He is possessed not only of all the ordinary qualifications for such a post as that which he is about to fill, but of one which will be variously viewed as constituting a recommendation or a disadvantage. He has for many years been the most active and successful teacher in the Roman Catholic University of Dublin, and he now undertakes the government of an institution which was expressly founded to promote mixed education. A contemporary has expressed surprise that the direction of one of the Queen's Colleges should be committed to a man "whose whole public career has been one of opposition to 'mixed education,'" and finds a difficulty in seeing how the new President can "do his duty at once to his own convictions and professions and to the establishment over which he is called to rule." This view of the appointment seems to us to be based on a completely erroneous theory of what mixed education really is. We shall make our meaning clearer perhaps if we illustrate it by an example drawn from the education controversy in England. The term Secularist may stand either for a man who is specially ready to adapt himself to the conditions under which he is obliged to act, or for a man who views these conditions in an utterly impracticable spirit. It is quite possible to argue that whatever may be the advantages of an education which combines religious and secular instruction, the difficulties of the two being imparted together are so great that the most convenient solution of the

problem would be to impart them separately. Everybody is agreed upon what secular subjects are to be taught, therefore the secular lessons shall be given to children of all creeds in common. No two denominations agree upon what religion shall be taught, therefore the religious lessons shall be given to the children of each creed apart. This would be reasonable secularism, and if the separation of religious and secular instruction had always been advocated on this ground, the opposition to the principle would probably have been very much less bitter than it now is. Instead of this, the separation of religious and secular instruction has been put forward, not as a convenient expedient for getting over a special difficulty, but as the embodiment of a great and irreversible law. The Secularist party have not been content with arguing that, as we cannot agree upon one part of a child's education, we had better make some joint arrangement for the parts upon which we can agree, and leave the part on which we are disagreed to be provided for in some other way. They have chosen to argue that, unless the separation of religious and secular teaching in all schools supported by public money is absolutely complete, freedom of conscience, religious equality, and ever so many other watchwords dear to Liberal hearts must become mere unmeaning phrases. The consequences of their taking this line may be seen in the indefinite postponement of the separation they demand. It has been carried out of the region of convenience into the region of principle, and there it has found itself overpowered by other principles equally intolerant and more popular.

The cause of mixed education in Ireland has usually been defended in much the same spirit. It may be admitted that there has been some excuse for this in the violence with which the idea has been attacked, but it would be hard to say whether assailants or advocates have done most to ensure its failure. There are three conceivable ways of providing Irishmen with the higher education. One is to have two Denominational Universities, a Catholic and a Protestant, equal in dignity and in wealth, and equally entitled to confer degrees in all the faculties. A second is to have a mixed University composed of Denominational Colleges. A third is to have a mixed University composed of mixed Colleges. The first of these plans has long been given up as impracticable. If there were no other objections to it, the impossibility of getting it adopted by any Parliament in which Englishmen and Scotchmen are represented would be sufficient to dispose of it. There is no need again to go over the history of the second plan. It was in substance the plan brought forward by the Government last Session, and it perished under the hostility or indifference of the people in whose interest it was proposed. The third plan is open to some objections in theory, and has the additional disadvantage of being unpopular in Ireland. But it is in actual operation, which is something; and it is apparently the only means left of providing Irishmen with a University education in their own country. Perhaps if it had not been preached as the only admissible solution of the problem, it would not have excited so much opposition. At all events, now that it is apparently the only solution left, it is the duty of the Government to see what can be made of it. If anything is to be made of it, it can only be by presenting it in an uncontroversial and unpretentious aspect. If Irishmen can be brought to see that, whatever may be their preferences for other forms of University education, a mixed University with mixed Colleges is the only practicable form for Ireland at the present time, the Queen's Colleges may yet have a future before them. But if mixed education is treated, not as a jury mast, but as the only rig admissible for the educational vessel, there is not the least probability that the controversy of which it has so long been the subject will lose any of its acrimony.

Professor SULLIVAN possesses the rare and almost exceptional distinction of being able to present mixed education in this conciliatory light. Other Roman Catholics might have been found to take the headship of Queen's College, Cork, but they would for the most part have been men known, not merely as supporters of mixed education, but as opponents—in some cases as fanatical opponents—of Denominational education. Professor SULLIVAN's connexion with the Catholic University is sufficient evidence that he does not belong to this class; while the fact that he is willing to accept the post is sufficient evidence that he has none of that rooted dislike of mixed education which is the characteristic of some, perhaps of most, of his brother Professors. The *Pall Mall Gazette* has thought it worth while to put

together certain quotations from a letter to Lord ACTON which Professor SULLIVAN published in 1866, and infers that, if he continues sincerely to hold the same opinions, he must either fail in his duty to Queen's College or do violence to his conscience. It would have been equally natural and more charitable to assume that, if the President of a mixed College cannot hold these opinions without doing violence to his conscience, Professor SULLIVAN has seen reason to change them in the seven years which have passed since he gave utterance to them. The interval between 1866 and 1873 is long enough, and the changes which Ireland has undergone in the interval have been great enough, to justify an even greater revolution of opinion than the one here suggested. But, as a matter of fact, there is no necessary inconsistency between the opinions expressed by Professor SULLIVAN in his letter to Lord ACTON, so far as they are quoted in the *Pall Mall Gazette*, and his acceptance of his present post. Professor SULLIVAN thought in 1866 that a separate Catholic University might be had, and he thought also that, supposing it to be attainable, it was a better thing than a mixed University. It does not follow that, now that the impossibility of a separate Catholic University has been demonstrated, he is bound to maintain his old objection to a mixed University. Supposing the question were whether, in schools for boys in a particular rank of life, Latin or French were to be taught, a parent might fairly say that he thought Latin absolutely essential to a good education, without being bound after the question had been finally decided in the opposite sense to keep his son away from school altogether. Professor SULLIVAN may regret that a separate Catholic University, and even a mixed University with a separate Catholic college, is no longer to be had; or he may have changed his mind upon this point, and think more favourably of mixed education in the abstract than he once did. But we are wholly unable to follow the argument that, because a man may have preferred one of two alternatives when he thought both were open to him, he cannot for that reason heartily or even honestly accept the other alternative when this alone is open to him. The *Pall Mall Gazette* objects to Professor SULLIVAN that he is "not likely to inspire with confidence the friends of unsectarian teaching." We were not aware that it was the friends of the Queen's Colleges who need to be inspired with confidence in mixed education; on the contrary, we had thought that those whom it is important to inspire with that confidence are the Roman Catholics, who have hitherto been hostile or indifferent to mixed education. It would be too much to say that Professor SULLIVAN's appointment will have this effect on the Roman Catholic parents of Ireland; but it may fairly be said that it is more likely to have it than almost any other appointment that could have been made.

MR. FORSTER ON CAPITAL AND LABOUR.

MR. FORSTER, as President of the Section of Economic Science and Statistics at the British Association, made a number of suggestions as to subjects on which he would have liked to hear papers read, but oddly enough he omitted all reference to one question to which, above all others, it would seem to be desirable that the members of this section should begin by giving a little attention. It would have been interesting to have had some definition of what really constitutes economic science, and of the point at which loose talk and random observation may be supposed to assume a scientific aspect. The late Lord DEBBY professed to be unable to follow the proceedings of the British Association, as he belonged to the pre-scientific period; but if he had lived to the present day he would probably have been struck by the extraordinary resemblance of scientific discussion to commonplace domestic twaddle. A Professor of Civil Law read a learned paper on the economic effects of the passion of women for expensive seal-skin jackets, and a lady discoursed on the difficulty of managing servants and getting a potato properly boiled, and on the wickedness of married men who frequent clubs instead of sitting at home with their wives. The French shopkeeper was much elated when he discovered that he had unconsciously talked prose all his days, and a new dignity will be imparted to the common incidents of household life by the scientific lustre which has now been shed on them. The only difficulty, if science includes so much, is to know where science begins and leaves off. Science is a word which has certainly been sadly abused in our time, but it may be doubted whether it was ever before so outrageously

burlesqued as it has been this year at Bradford in the session over which Mr. FORSTER presided. Mr. FORSTER's moderate and plausible address skimmed very lightly over the surface of his subject, and it was evident that he felt himself in a false position. He confessed at the outset that there were several questions upon which he could not touch at all, as they would carry him into the region of controversial politics; and in dealing with other questions he had the appearance of trying to trim between conflicting interests and parties. He avoided specific facts, and stuck to broad assertions and vague principles. On the whole, the condition of the labouring classes had improved. They had more comforts and luxuries than formerly, they had more education, and their wages had risen beyond the increase in the cost of living. No doubt they had some faults, but then all classes had faults. And no doubt, too, there was much yet to be done for them, but he would not go into the question whether it should be done by themselves or by others. The feud between capital and labour was less bitter than it used to be, and both classes ought to try to get on amicably together. A league of capitalists against a league of labourers would be very sad. It was dreadful to think of the country being thus broken up into two hostile camps. And so on. When Mr. FORSTER's speech has been peeled and boiled, this is really about all that is left, and though it may be all very true in its way, it is difficult to see what light it sheds on the problem of capital and labour, or on the principles by which the conduct of each side should be regulated. Mr. FORSTER explained that he was anxious to avoid saying anything to commit the Cabinet, and he also took good care not to commit himself. It was only natural that in his peculiar relations to his constituency, and with an election in prospect, he should do his best to make things pleasant all round; and no doubt people at Bradford were very glad to hear him. But Mr. FORSTER can hardly have seriously imagined that he was doing anything to promote the scientific investigation of the subject. The hedging which may be pardoned in a politician is inexcusable in a scientific inquirer.

Mr. FORSTER is certainly right in saying that the immunity which was extended to the Trade Unionists who planned and executed the abominable outrages at Sheffield ought not to be established as a precedent; but the circumstances of the case were very peculiar, and it is possible that, on the whole, the good effects of the course which was then pursued may have balanced the evil. The inquiry led to the breaking up of a murderous conspiracy, and shamed the Unionists into the abandonment of some of their most villainous practices; and it is doubtful whether the miscreants could have been exposed in any other way. Mr. FORSTER is also justified in saying that disputes between master and workman are conducted with less fierceness than in former times. There is certainly less open violence. We suspect that Mr. FORSTER underrates the opposition of working-men to the use of improved machinery; but employers have now no reason to be afraid of having vitriol cast into their eyes, and rioting and fighting have ceased to be the natural incidents of a strike. Strikes, like wars, have also become shorter; the relative strength and powers of endurance of each side being more readily tested in consequence of their superior organization. Employers and workmen understand each other's circumstances better; and within a week or so after a strike or lock-out has begun, it may be calculated with a good deal of confidence which party must give in. On the other hand, however, as Mr. FORSTER omitted to observe, strikes are now organized on a larger scale, and seem to have a tendency to repeat themselves with unpleasant frequency. It would also appear that, if Unionists have shown a disposition to keep on the safe side of the law, it is because they think that it will be as well for them to have the law on their side, and that they are powerful enough to get it altered to suit their views. The legal recognition which has been bestowed on Trade Unions is of great service to them in the administration of their internal affairs; and, if they can only succeed in getting rid of all criminal penalties for intimidation and breach of contract, they will be placed in an extremely advantageous position. Mr. FORSTER has a reputation for courageous frankness which is not invariably justified; and on the subject of intimidation he spoke less distinctly than could have been desired. Admitting that the law must protect all men against "bodily harm or physical violence," he uttered a warning against the fatality of attempting to protect men "against persua-

sion, or even against moral intimidation." It would have been well if Mr. FORSTER had explained a little more clearly what he means by moral intimidation. Nobody proposes that persuasion should be punished; but there are various kinds of intimidation which may not involve physical violence or bodily harm, but which it would be dangerous to sanction. The Unionists in Scotland, for example, have lately been raising an outcry because one of their number was sent to prison for "merely looking" at another man. What happened was this. There was a strike, and the Unionists took it in turns to stand in front of a shop where a man continued at work, and to look through the window at him. In other cases obnoxious workmen are followed with offensive cries, or perhaps by pickets who dog their steps in silence. These are all forms of intimidation which the law can and ought to check, although they do not involve physical violence; and it is unfortunate that Mr. FORSTER should seem to be hinting an apology for them.

It is unnecessary at this time of day to argue that working-men have a perfect right to combine whenever they choose for the purpose of making the best terms they can for themselves in regard either to wages or hours of labour. Everybody admits that the labour market ought to be free, and that employers and workmen should be left to higgler together without unnecessary restraint on either side. The only points in dispute are as to the extent to which workmen who choose to act independently require to be protected from the oppression of the Unionists, and as to the necessity of enforcing contracts by criminal penalties when there is no other way of reaching the offenders. If, as Mr. FORSTER seemed to suggest, the definition of intimidation were to be cut down to cases of actual bodily harm, the law would fall very far short of the necessities of the case; and, on the other hand, a mere civil remedy against working-men who are here to-day and gone to-morrow, and who have every opportunity of avoiding any claims upon them, would of course be an utter farce. If these restraints were removed, the Unionists would become simply the most powerful body in the country. They would be able with absolute impunity, by the exercise of just a little care, to harass the life out of any working-man who dared to disobey their mandates on any subject; and they would also have it in their power to coerce employers by threatening to throw down their tools at a critical moment. It is impossible to imagine a more demoralizing or intolerable tyranny than would thus be established. The executive of the Unions would be invested with an authority of the most despotic kind, and would be tempted to commit all sorts of excesses; and employers and labourers would alike be placed helplessly at their mercy. The consequence of such a state of things would of course be a general paralysis of industry. Employers would be deterred from entering into contracts to do work except at excessive rates calculated to cover the risk to which they would be exposed from the organized treachery of their workmen, and the wages-fund would be correspondingly reduced.

Apart from the right of the working classes to push their own interests in their own way, as long as they do not attempt illegal interference with other people, there remains the question whether the principles upon which the Trade Unions are conducted and the objects which they have set themselves to accomplish are in themselves sound and beneficial. Mr. FORSTER found it convenient to slur over this aspect of the subject. The whole system of Trade Unions is founded on the supposition that the amount of work to be done is a fixed quantity, and that it is the business of a trade organization to do all it can, in the first instance, to interpose artificial obstacles in the way of men coming into the trade, and, in the next place, to secure an equal share, irrespective of capacity or industry, for all who have contrived to enter the sacred circle. It is assumed that prices have nothing to do with the demand for a particular kind of work, and that if an employer feels pinched by wages being forced up, he can always recoup himself at the expense of the public. It is overlooked that the public has also a means of protecting itself. It would be absurd to propose that the working classes should be compelled by Act of Parliament to promote their own interests in accordance with sound principles of economic science; but it might perhaps be expected that a political teacher who says he has no faith in anything except "the force of public opinion and education" would have felt bound, if he thought it necessary to speak

at all, to point out the natural and necessary consequences of the fallacious policy to which the Unions have committed themselves. This is not a question of sympathy with working-men or with capitalists. It is simply a question as to whether water will run up a hill.

THE BRITISH ASSOCIATION.

NO one will accuse the Council of the British Association of carelessness or want of judgment in their choice of a man to fill the office vacant through Dr. Joule's resignation. Professor Williamson's position among the scientific men of the day is such that it must soon have been recognized by a similar appointment, even if the sudden vacancy had not secured him so early a nomination. And for many reasons it was particularly desirable that the occupier of the presidential chair should have specially devoted himself to chemistry. It cannot be denied that of late the honours of the day have chiefly fallen to those eminent in the non-chemical branches of science. This can easily be accounted for. Though chemistry has doubtless made rapid progress in late years, its exploits have been thrown into the shade by the marvellous discoveries in physics and biological science. We do not deny that these sciences owe much to chemistry, as she owes much to them. The physicist, the chemist, and the physiologist are often at work on the same problem, and the discoveries of the one lighten the labour of the others; indeed, so much do they borrow from one another that it is at times difficult to decide to which of them the credit is mainly due. But we think that an impartial observer would allow that none of the more remarkable advances that science has lately made have been directly due to chemistry; and hence the other sciences have deservedly received the lion's share of recognition at the hands of the British Association, and it has become desirable that there should be a change in this respect. We might thus have expected that a chemist occupying the position of President would seize the opportunity to review the recent achievements of science from a chemical standpoint, showing how chemistry gives the interpretation of certain phenomena where physics and biology are dumb, and how it is by her aid that we have approached by sure ways so near to the most mysterious processes of organic change. Perhaps Professor Williamson had some such idea as this in the first part of his address, where he professed to be ascertaining "the meaning of the work which has been going on in chemistry"; but, if so, he was singularly unfortunate in the execution of his design. Beyond a reference to a very interesting theory of his respecting the dynamical nature of even stable compounds in a state of solution, which must have been too brief to be intelligible to the major part of his audience, and still briefer references to the well-known phenomenon of isomerism and the classification of atoms into monads, dyads, &c., the whole of this part of the address was a laboured defence of the atomic theory, and was, we suspect, saved from being still more decidedly controversial only by the pressure of other matter which he felt bound to introduce. A good defence of the atomic theory might not have been out of place had it been based on arguments drawn from the present condition of science, and had it contained a clear appreciation of the points at issue between its supporters and their opponents. But we think that it is not too much to say that the speaker wholly misconceived the question at issue. In fact, he confounded the laws of combining proportions with the atomic theory. The truth of the former no one doubts, but it is wholly distinct from the latter, which is an hypothesis concerning matter from which it is conceived these laws would flow; and which, therefore, so far as these laws are concerned, is a satisfactory theory of the ultimate constitution of matter. That he thus confuses them may be seen from his urging against his opponents that "When they interpret their analyses, those chemists allow themselves neither more nor less latitude than the atomic theory allows—in fact, they are unconsciously guided by it." The "latitude that the atomic theory allows" can mean nothing else than the very laws of combining proportions to explain which it was started, and which must of course form part of, and be explained by, any system that takes its place. It would be equally rational for a believer in the emission theory of light to attack the supporters of the undulatory theory for using the laws of reflexion and refraction, on the ground that they belonged to the emission theory. He too might say that, because they "allow themselves neither more nor less latitude than the emission theory allows" in tracing the course of pencils of light, they were "unconsciously guided by it."

It is indeed strange that Professor Williamson should have confounded together two ideas so distinct. No one doubts that in chemical processes bodies behave much as they probably would do were the atomic theory true, and few will deny that it gives the simplest method of recollecting the laws of that behaviour. The point in dispute is, whether the hypothesis of the truth of the atomic theory is necessary to explain chemical phenomena, and whether it is sufficient to explain the phenomena of physics. And here evidence is sadly against the theory. The chemist must remember that his methods of analysis are no longer the subtlest that we have. The spectroscope and the polariscope tell us of structure and heterogeneity where the chemist finds only uniformity. He would have us believe that iron is nothing but an agglomeration of like atoms without definite arrangement. In however small quantities it be, its properties are the same; no combinations into which

it enters suggest the idea that it has been resolved into component elements, so that he would have us believe that it is composed of uniform atoms, like and indivisible. But the spectroscope tells us a different tale. It shows us that these pretended atoms, when heated sufficiently, send off scores of different kinds of light, each kind perfectly definite and separately recognizable; and as we know that each of these must have a different rate of vibration which again must have been excited by a source having a like rate of vibration, we see at once that this would-be atom is a wondrously complex system. It may be that it is so firmly bound together that no chemical tests can tempt it to separate, yet it must be composed of many parts capable of independent motion. A savage or a child might imagine that the sound of an orchestra in full play was the confused noise of some huge beast. A musician at once recognizes that it is made up of the sound of distinct instruments, and can separate the sounds one from another, and thus tell the component parts of the system. Just such a difference is made by arming the man of science with the spectroscope. And when we find that the supposed atoms are complicated systems, who will venture to dogmatize on the composition of these systems and pronounce authoritatively as to whether they are themselves made up of component atoms or arise from unequal stresses in continuous matter or from some yet more complicated cause? Why should Professor Williamson shut his eyes to this just because he need not immediately regard it in his science? Since at present the atomic theory is wide enough to include chemical phenomena, let him retain the nomenclature and system of interpretation belonging thereto. We do not wish to be pedantic, and require him to speak of "ultimate systems" instead of atoms. But, on the other hand, he has no right to grumble if physicists occasionally remind chemists of the provisional character of the hypothesis.

It is to be lamented that Professor Williamson should have failed to treat the atomic theory in a scientific manner, for the rest of his address could scarcely be said to deal with science at all. It is true that he dwelt with admirable force on the beneficial effects of the study of chemistry alike on the intellect and on the moral character of the student. On the one hand, it gives him accuracy and power of carrying on all the many processes necessary to a sound induction; on the other, it gives to him a habit of truthfulness—not of that low-type truthfulness which is content with the "I am informed and verily believe" of an affidavit, and seems to dread nothing short of perjury, but that higher truthfulness which seems to consider itself responsible for the objective truth of its statements and feels itself almost as humiliated if errors occur in its statements as if it had wilfully lied. This habit of mind is generated sometimes by the consciousness that the detection of falsehood in science is certain, but more usually we will hope by enthusiasm for truth; and it is so strikingly characteristic of scientific men that, whatever be their speciality, they are good witnesses on all questions within their ken in subjects that do not touch on theology, and many of them even on these. And there is perhaps no branch of science by the study of which these great qualities are more speedily generated than by chemistry, so that Professor Williamson might well be allowed to say, "Chemistry presents peculiar advantages for educational purposes in the combination of breadth and accuracy in the training which it affords, and I am inclined to think that in this respect it is at present unequalled." But the greater part of his address was devoted to the elaboration of a vast scheme of scientific education which would, he thought, have the highly desirable result of landing every boy of ability in a Professor's Chair. It is difficult to conceive what induced the President to leave the question of chemistry, about which his audience did wish to hear, to talk about schemes of secondary education, about which they did not wish to hear. It was a subject by no means specially suitable for such an address, and moreover it was not likely to be successfully treated therein, as the difficulties are practical rather than theoretical. Perhaps he foresaw that Mr. Forster would be in a prominent position among his auditory, and he trusted to wring from him, in the enthusiasm of the moment, some promise which would afterwards have to be made good. How could Mr. Forster refuse to accept *in toto* the scheme so full of promise sketched out by Professor Williamson? Everything fitted in so beautifully! Its success seemed demonstrable with Euclidean certainty. But the prospect must have seemed less bright to the eye of the Minister. Taking precedence of the less important question, whether there should be scientific education for those capable of making good use of it, there must have risen in his mind the vastly more weighty question whether these secondary schools should be visited at certain hours by a selection of the neighbouring clergy to prevent any of the regents being used in a manner not contemplated by the Prayer-book; or whether they should be visited by inspectors certified to be of latitudinarian principles to ascertain that chemistry was taught in a thoroughly unsectarian manner. No wonder, then, that he cautiously remarked, in moving the vote of thanks for the address, that the subject was so large that he felt it impossible to enter on it then. But though we think that the President might have employed the time much better than in dwelling on subjects which belong rather to the domain of the practical politician than to that of the scientific specialist, we find much that is excellent in this part of his address. He boldly preached the doctrine so fully exemplified in the German system, but which is so distasteful to English educational reformers—namely, that examinations are practically of but little worth unless worked in intimate connexion with a

system of training. We insist on having free-trade in education in England, and we pay for it dearly, since our competitive examinations threaten soon to have, but one effect, that of rendering cramming more scientific, and thereby more fatally successful. Again, Professor Williamson sees clearly that it is useless to attempt to strengthen and improve the English scientific schools by sweeping changes in the Universities. No doubt changes must come, and they will be welcomed by most of the existing educational staff there. But the first thing is to improve the scientific teaching without the walls of the Universities. Already the partisans of science at Oxford and Cambridge are admitting that there is not the supply of first-rate candidates for the scholarships offered for proficiency in natural science that they expected. And if the small supply of science students renders it inadvisable to increase the number of scholarships offered in these subjects, it should make us still more careful about incautiously increasing the permanent educational staff. For some time yet there will be a great prejudice at our older Universities in favour of men educated therein; and since, in the absence of a keen competition, University honours often fall to the lot of those who are little worthy of them, there is great danger that the permanent posts will be filled up with men of mediocre abilities, who will in process of time prove a serious obstacle to the success of the science schools of their Universities, inasmuch as they will occupy the posts that should be occupied by better men. One change, however, might perhaps at once be made safely. The number of Professors' Chairs might be made to some extent variable, so that any man of special ability might be retained at the Universities in a position akin to that of the Professor Extraordinarius, until a place was found for him in the regular educational staff.

But if Professor Williamson wandered too far from his proper subject in his presidential address, the same cannot be said of others who were chosen to lecture to the British Association at Bradford. Professor Maxwell's lecture on Molecules must have mended much of the damage done by the misconceptions of the President on the subject of atoms, and it was worthily supported by the other two lectures on the all-engrossing subjects of Coal and Fuel. These lectures, together with the President's address, naturally form the chief centres of interest at each meeting of the Association. It is natural that the mass of the scientific public should turn to these *résumés* of scientific progress—able and yet popular as they always are—rather than to the special papers read in the sections. If the latter are written by genuine investigators on researches that can fairly claim to have increased our scientific knowledge, they must be in most cases of so technical a character as to find but a small audience to appreciate them. But it is usual to find even in the papers which treat of the less popular sciences some one or two which unite the qualities of being new to specialists and intelligible to the outside world. Though the conquests of science, like the exploits of our Indian troops, chiefly consist in the subjugation of lands of whose existence we are first made aware by the news of her triumphs, yet occasionally she turns to reduce to order some home province whose state of anarchy she has had hitherto to tolerate. This year has proved no exception to the rule. Few parts of the reports will be perused with more interest than those which contain Professor Ferrier's paper on the Localization of Function in the Brain, and the discussion that followed on its being read. It is not that so many were aware of the existence of the corpus striatum, or the hippocampus major, and were rendered uneasy by the consciousness that no definite function in the human economy had been yet assigned by physiologists to the happy possessors of these sonorous names. But people who could not distinguish between the optic thalamus and the medulla oblongata can understand the drift of these new discoveries, and can see that the problem which phrenology failed to solve because it was so unscientific in its method has at last fallen into worthy hands. The average educated man, though he will not confess to a belief in phrenology, has yet a sneaking kindness for it. And we think that he is right therein. Its fate has been that of many an imperfect attempt at developing science in a right direction. Put forth in an unscientific form by its originators, and defended by utterly inconclusive arguments, which have been mercilessly shown up by their better educated opponents, it has been many times pronounced dead. But its enemies have been too exterminating in their rage. The attitude of mind produced by such attacks as those of Jeffrey, Hamilton, and Dr. Carpenter, is one of conviction that the science owes very little to the labours of its originators, and that whatever of truth lies in it is due to the idea itself which underlies all their work, and of which they were but unworthy exponents. And as notions on the subject of evolution have become clearer, the belief has become more and more firmly fixed in most minds, that the brain—partaking as it does of the wondrous heredity of the human body—could not be reproduced were the special powers but inherited in common by large masses of functionally undifferentiated nerve matter. To account for the inheritance of mental faculties, these masses of nerve matter must be functionally differentiated to a degree comparable not only with the immense variety of bodily actions, but also with the still greater variety of mental processes. No doubt phrenology went further than this, and in that consisted its error. It assumed that this differentiation must be local when viewed in the light of those complex combinations of brain-activities which constitute tastes and special faculties. But, in spite of this, we must give to phrenology the credit of first teaching plainly that the different parts of the brain have different functions, and this is the burden of Professor Ferrier's discoveries. It is

needless to say that his method is widely different from that of Gall and Spurzheim, and there is as wide a difference in the sides on which they attack the problem. Socrates thought that man might find out the nature of the soul, but he gave up physics as hopeless. The phrenologist would have as much despaired of finding what part of the brain moved the right leg as Professor Ferrier would despair of finding the part of the brain that was the abode of acquisitiveness. But though the immediate object of his researches has been as it were the coarser parts of brain-physiology, the prospect opened out reaches far beyond this. He guards against the disturbing effects of the general activity of the nervous system by lulling it to sleep with chloroform, secure that he will so lessen the sympathetic action which characterizes it that a specific excitement will produce its own effect, unmingled with any secondary induced activity, which in a more excitable state of the system would inevitably accompany it. Yet even with this precaution a strong stimulus produces general disturbance. After a few functions are satisfactorily localized, it may be possible to notice what subsidiary activities are first excited when a particular stimulus is increased beyond the strength at which its correlated activity is produced without intermixture. Will this be decided by mere contiguity of the seats of the functions, or by the more complex laws of mental association? A few experiments of this nature would soon enable us to decide on the truth or error of Mr. Herbert Spencer's alleged physical correlatives of mental growth. And even those who content themselves with a style of scientific writing less prophetic and more historical than his will feel hopeful that this method of Professor Ferrier will some day prove itself capable of dealing with intellectual processes. Specific thoughts and mental processes have actions so closely connected with them by habit that they involuntarily follow them, and though the presence of the thought may not be directly ascertainable, it may be indirectly tracked by the presence of those actions. To give a crude instance; the phenomena of anger are so definite that were some state of the brain or the excitement of some part of it found necessary to the spontaneous combination of these actions, one would not be far from discovering the physical correlative of irascibility.

Is there never to be a truce to teleological discussions? Now that the supporters of the argument from design have ceased from actively interfering with the progress of science by opposing every explanation that seems to account on natural grounds for some remarkable adaptation of structure to function, merely because it lessens the amount of that which seems to need a designer, it is the turn of the opposite side to abstain from tilting at what are honest convictions inoffensively held. Really the supporters of the argument from design are made to appear the more scientific as being endowed with more of that scientific patience which leads people to confess the limits of what they know and what they do not know, and to wait for more light instead of insisting that the twilight is the day. We know so little of the secret chemistry of the body that a paper professing to show that the doctrine of design is baseless because the author could find no use for the "small vermiform appendage known as the diverticulum of the cæcum," and yet that death had been known to arise from it becoming strangulated, is vastly out of place. It was allowed that it was useful to the embryo; indeed the learned Professor who abused the minute offender did not go further than to compare it to a siding employed in the construction of a railway left open on its completion. And yet he thought this entitled him to say that the work in the human system was such as we should not accept from a tradesman. If no worse attacks were made on the argument from design, the *Bridgewater Treatises* would still be saleable. The learned Professor does not seem to have grasped the position of his antagonists, or known the wide and intricate meaning which they put on the word design. He avers that he has shown that no designer could have allowed the appendage in question to remain, because it produced death in some instances. Does he not see that whatever be the meaning of the word design in his antagonists' mouths, it must include the intention of death being produced in every instance by some part or other of the organism? Indeed those cases in which the organism of a creature is found not to be such as would be most favourable to its own duration of life are at least as great difficulties in the way of believers in evolution by natural selection. In the theories of these alone has the development of each animal been guided by what may be called an eternal selfishness. But in fact such difficulties are not fatal or even injurious to either theory; they tell us of nothing but the laws under which the designer or the evolution has acted, and they alike modify and condition each theory, but do not injure it. Nor are such theories to be attacked directly. Let our scientific men labour conscientiously, not allowing themselves to be biased by teleological prejudices or the reverse; and then the attitude of their mind, or rather its reflexion in the general belief or disbelief of the world in the argument from design, will represent the true teaching of science on the question. At present we are not able to grasp what is meant by ascribing everything to evolution or everything to design, so that attempts to balance difficulties are ridiculous. Far different from this endeavour to snatch from imperfect knowledge a decision fatal to what is as certainly imperfect theology is the attitude in which Professor Maxwell points out the inadequacy of our scientific theories to account for the genesis of the materials of our world. His argument is marvellously weighty compared with such a flimsy one as that of Mr. Herbert Spencer, which is little more than the statement that the mind has a fit of in-

digestion when it attempts to assimilate the idea of something arising out of nothing. The Professor admits that the mind cannot reason about the creation of matter out of nothing—it cannot lay hold of the subject-matter of the argument, or weigh the rival difficulties of its being created or self-existent. It is in the consideration of the form in which matter exists that the mind first finds anything on which it can lay hold. And here it is startled by finding that the countless crowds of molecules of each substance are exact reproductions of each other—each molecule of hydrogen containing but a certain quantity of matter and no more—an identity which gives to them, he thinks, the character of a manufactured article (a phrase of Sir John Herschel's), and leads us irresistibly to the conclusion that they have had a maker. We cannot join with Professor Maxwell in his praise of this phrase of Sir John Herschel's. Any one who reflects will see that the manufactured articles are associated in our minds with uniformity chiefly because the vast majority of them are the product of machines, and that, in proportion as machines take less part in the manufacture we see uniformity supplanted by specific adaptation, unless hindered by poverty of design on the part of the manufacturer. Nor do we quite share Professor Maxwell's confidence in the absolute uniformity or unchangeability of the molecules, though on this point there is no single opinion of so much worth as his. But in calling our attention to the fact that our universe is not built up out of matter possessing every variety of structure and quality, but out of a few definite forms, all the matter that belongs to each form possessing definite properties, and possessing them to exactly the same degree, and thereby separated by an unpassable gulf from all other matter—the exact opposite of what we must imagine would be the consequence of any theory of mechanical evolution, using that phrase to denote an evolution which does not depend on reproduction and heredity—he has brought us face to face with another aspect of the great difficulty of theories of the universe which leave out all mention of a Creator, and he has accomplished that most difficult feat for a scientific man—he has exalted his religion without degrading his science.

THE PLEASURES OF A MOOR.

GROUSE-SHOOTING, as far as we can gather from the ordinary descriptions given of that pursuit, seems to be one of the most delightful occupations imaginable. Sun and luncheon, heather and repose, are its chief constituents. The jaded man of business regains health, the leisured idler shakes off ennui. The troubles incident to other modes of spending the holidays are all absent, and the moor is a charmed circle of pleasures gazed at with envious eyes by those who cannot share in them. Yet there are other conditions besides those of discharging guns and lying on purple slopes which play as important a part in the tenancy of a moor as the marriage settlement in a marriage. Experience must be gained, and mistakes must be made. Every season a certain number of persons engage shootings for the first time, and are obliged to some extent to rely upon the reports of those who are most interested in the disposal of them. The first step does not present any difficulties. Some London gun-maker has a client who fortunately possesses a moor and a house which exactly meet all requirements; but not a moment must be lost in securing it. Six gentlemen are anxious to take this particular moor, though none have finally decided upon doing so. The gun-maker will reserve it; the shootings have a wonderful name, but they exist, and a great white tract of territory is pointed out on the ordnance map to prove this point. It is the best possible of all moors. Disease stopped short of it, though neighbouring policies were decimated. There is a river which swarms with trout, a lodge, and a shaggy wood behind the house in which capercaillie abound. Butter is made upon the premises, and the local store-dealer combines every known trade within his shop. These glowing details are confirmed still more strongly by the intending leasor and proprietor, who expatiates on the beauties of his own place, enumerates its advantages, asserts that grouse may be killed in many hundreds, and gives a catalogue of the bags made in former years. The next step is to sign a little agreement just for form's sake, by which the lessee covenants to pay his rent on the first of August, in return for which he will be allowed to spend in a harmless manner for the space of three months what Lord Houghton well calls the superfluous energy and occasional savagery of his disposition.

If the lessee is wise, he will go down to Scotland before the twelfth, and not postpone the arrangement of every detail until the last moment. The anticipation of pleasure is a far more satisfactory thing than its analysis. Immunity from begging-letters, from circulars and prospectuses, from the appeals of bankrupt electors, and the clamours of licensed victuallers, constitutes to many a tourist a great part of his enjoyment. A man whose letters are forwarded to him during the months of August and September deserves his misfortunes. It is not until the last crowded station has been left behind that a sense of freedom is felt. A Scotch platform is a peculiarly trying ordeal. You are under the impression that you know the language spoken, and yet you can obtain no information. The trains are two hours late, and the porters exhaust the refinements of their Scotch intellects in giving evasive answers. A man in a kilt and of a savage aspect represents his nation, as he pushes through the London

crowd, who, like the poet Crabbe among the Highlanders in Edinburgh, would be inclined to address him in French, unaware of the fact that, in spite of his nudity, he is a commercial gentleman just arrived from Manchester. Yonths with fishing-rods are rushing about in all directions, stumbling over the dogs which are howling dismally at the foot of the pillars to which they are chained. All is noise, unpunctuality, and ignorance until the quiet terminus among the hills has been reached, where no English newspaper is sold, and where all the carriages in the village have been waiting for days in eager expectation to convey the sportsman to his hired heather. Then follows the long drive up some Highland valley studded with white cots beside the hills, gleaming among their silver firs, with the glorious background of the heather just coming into full blossom. At last the particular cot is seen where three months of quiet and highly-paid life are to be passed. The advantages named in the advertisements can be recognized at once. A little lodge gives access to a bridge across the river, and to the road beyond, winding along a sparkling burn overhung by larches and the red boles of Scotch firs. The day is fine, and everything looks bright and genial. The house is as comfortable as another person's house can be where the book-cases are locked up, and stuffed birds form the principal ornaments of the hall. The first day is a success; no great calamity has taken place, no cardinal defect has been discovered. The water runs through the pipes, the smoke goes up the chimney, and the kitchenmaid has not been carried off to the top of a fir-tree by a capercaillie. The servants, astounded at seeing signs of civilization in the shape of stewpans, make up their minds that existence is possible, though there are no shops within ten miles. The lady's-maid alone will not be comforted, and weeps in secret, while her highly-wrought organization fails to comprehend the eccentricities of her mistress. Shooting, however, was the nominal end of the expedition, and its prospects must be inquired into. The air may be very good, the water excellent, the family portraits of indisputable ugliness; but the tenant has not paid the rent exclusively for the possession of these advantages, not to mention that there is no kirk within a distance of five miles. The keeper is sent for, but he is enigmatical in his answers. He entertains his master with statements about the number of birds killed in former years. "May be" precedes all his remarks. There has been no disease to speak of, but the spring frosts have been severe. To the lover of nature nothing can be more delightful than the view from the hill behind the house. A broad expanse of moorland lies in front; the purple masses of heather stretch from peak to peak, and bright tarns glimmer in the distance. In the enjoyment of an air uncontaminated by chemical adjuncts the grouse are forgotten. But the next day the weather changes and the Highland climate shows what it is capable of; the hill is not visible, encircled by its "misty coronet"; the roads are impassable, the burn becomes a river, the river a flood. The house runs with damp, and its occupants cower over the fire and look with envious gaze at the novels in the closed book-cases. The books brought down from London were selected with a view to edification, not amusement. Even Mrs. Grote's account of her husband's family and his diary when in love fail to reconcile her readers to their situation. The atmosphere is so disagreeable that the little man and woman in the primitive barometer both insist upon staying in their hut. The Highlands were a great creation, but Sir Walter Scott created them to be enjoyed in fine weather, and not to be contemplated through fog and mist.

When the twelfth arrives, the ground is in a spongy sodden state, the clouds are racing over the moor driven by the North wind, and the lights and shades are momentarily changing. The grouse appear to have been blown away; a few old birds rise out of shot with an unearthly crow, and a snipe glistens against the horizon. One drenching shower succeeds another, which the gillie pronounces to be either "soft" or "coarse." The dogs cannot conceive for what purpose they have been brought out. Patch after patch of heather is beaten, and beaten in vain. The keeper wonders with just astonishment where the young broods are. One of the dogs is next discovered munching the bleached bones of some bird which bears a curious affinity to a grouse, and four more skeletons are found in different stages of corruption. When the time for luncheon has arrived, the bag consists of three brace of birds, a blue hare which was found asleep on coming over a bank, and two young rabbits which have left their holes for the first time. No special incident has enlivened the morning, as occurs in the veracious accounts of sporting adventures; no wild goose or red deer or tiger has fallen a victim to a charge of No. 6 shot. Luncheon is eaten under a wall in a shower, and the painful conviction forces itself upon the lessee's mind that the grouse have been decimated by disease, and that the spring frosts have destroyed all the young broods. He may endeavour to console himself in a poetic fashion, and believe that his object in taking a moor was

The wild wood's fruits to gather,
And on my true-love's forehead plant
A crest of blooming heather.

But it may occur to him that it would have been easy to have paid this tribute of affection at a cheaper rate. One illusion disappears after another; calamity succeeds calamity. The wood which was said to abound with roe-deer, black-game, and capercaillie, abounds only with woodcutters and gangs of weird females who are engaged in stripping the bark from the fallen larches. A fall of thousands of trees is taking place, every path is blocked by stems, the ferns are broken, and the rabbits believe that the Game-laws have at last ceased to exist. Hilly path and open stretch resound with the hissing of a steam-engine erected on the premises to cut up the

wood, which the shoeless savages of the district flock to admire. The game, if there ever was any, has naturally taken to other quarters. The capercailzie are so well acquainted with man that their wildness is shocking to see. The lowland shootings, a special feature in the advertisement, consist of three fields of green oats flattened by rain, the harvest of which could not be counted upon until the beginning of December. In them may be supposed to lurk two partridges which the keeper remembers to have seen in the spring, but has not heard of since. As for the moorland, the expectation of killing anything after the first week is ridiculous, nor is there the least chance of a walk being blighted with the sorrow of anything but the walker. The dogs which have been guaranteed as priceless animals become quite demoralized, and suggest the idea that they have been changed on the railway, so little do their habits agree with the characters given of them. One looks as if he had travelled in a happy family, or been the pride of a circus, invaluable in firing off a gun or playing on the violin. He has long poodle ears, a continual bark, a nervous affection of the countenance, and a universal range. "Ye auld fule," says the keeper in despair, "a mon might kill ye, but he'd never break ye." He will run over four thousand acres in about half an hour, gallop over two neighbouring moors from a love of pure travel, and show no signs of fatigue in the evening. The only way to utilize him is to tie five pounds of heather to his neck, by which means he may occasionally be kept in sight. It makes however little difference what is employed in finding game if the game does not exist. By following the course of a burn, a bird may perhaps be found hardly able to flutter, with a pinched breast and dazed eye, whom it is a charity to kill. Nothing after this is seen until a corrie is reached, three miles distant, where the remnant of a brood, three in number, endowed with preternatural sentience, may be stalked. Besides these there survive two teal and one old cock, who, though generally off the boundary, is sometimes to be met with in the middle of a deep and dangerous morass.

A writer in the *Field* is anxious to know what the average price of grouse has been to the tenants of moors. We imagine that this season they will have cost from five to seven pounds a brace; at the same time it ought to be stated that 3s. 6d. can be obtained by selling them to the local dealer. What the future of grouse-shooting is to be we do not venture to predict. In those cases where leases extending over a period of some years have been given, a sufficient stock of birds will no doubt be left upon the ground for breeding purposes; but where the shootings have been let for one season only the reverse is likely to have taken place, and some years may elapse before the birds of past times recur again. If the proprietor of a ramshackle Highland tenement has avenged Flodden this year, he cannot hope to have continued success in his sale of diseased grouse. Bad as the reports were of the moors during the summer, experience has proved that they were not exaggerated; and intending lessees cannot make too careful inquiries for the future, unless the prospect of finding game is entirely subsidiary to that of eating luncheon on the top of a hill. In spite of disease, and the absence of birds, rents have been largely raised this year; fifty per cent. has been added in some cases to the price of a deer-forest, and the question which at present agitates the mind of the Scotch laird or speculator is to what extent he can make capital out of the English goose that lays the golden eggs.

THE POLARIS EXPEDITION.

THE return of the last half of the *Polaris* expedition completes an interesting episode in the history of Arctic adventure. When half the crew had floated away on an iceberg opinions differed as to the probable fate of the remainder of the party. Those who look with disfavour upon all these expeditions, as involving unjustifiable risk of life, naturally inferred that we should know nothing of their fate unless some luckier explorer discovered their bones. More sanguine people argued that they had the better chance of the two, inasmuch as a still seaworthy ship is a better refuge than an iceberg, and a party composed of adult men more capable of helping itself than a party including women and children at the breast. The risk, however, was in any case not to be despised. In fact it seems that, although no life has been lost, the successful result has required courage, energy, and discipline. We have not as yet a complete record of the adventure; nor have we the means of completely reconciling the accounts of the two fractions of the crew. Some fuller explanations are needed to explain how it came to pass that the separation was so decisive and irremediable; and we shall then be better able to say whether anybody deserves to be blamed, or whether, as we rather hope, the whole blame must be thrown upon uncontrollable circumstances. Meanwhile, the separation having once taken place, the party on board the ship seem to have done all that could be done. They built a house; they made themselves as comfortable as circumstances would allow during the winter; and when the milder season returned, they constructed makeshift boats, and forced their way southwards. Of course they had to endure considerable hardships in spite of the timely assistance of Esquimaux, and the encounter with immense flocks of auks. But without loss of life, or even injury to health, they reached the track of the whalers, and have in due time made their appearance in a civilized country. We hope that some member of the party is endowed with the rare faculty of telling a good story decently well. In that case we may look forward to an interesting narrative, including the details

which should fill up this blank outline. The chances are, of course, very much against such a consummation; for the literary faculty, rare enough in the whole human species, seems to be distributed with peculiar parsimony amongst the travelling variety. Perhaps a spirit of adventure is located in some convolution of the brain which cannot be fully developed without attenuating the other portion of that useful organ which sets a pen in motion. When Professor Ferrier has fully carried out his investigations, we shall be able to speak with more confidence upon the subject. Whatever the cause, the fact seems to be certain; for otherwise we cannot account for the circumstance that so many people who have excellent materials for a thrilling narrative are incapable of making use of them. Let us hope that in the present instance we shall find an exception; and that amongst the crew of the *Polaris* there is some worthy successor to Kane's power of writing a book as well as to his spirit of adventure.

We are however anticipating, to use the good old formula of novelists. The essential facts are now pretty well known; and the only question is as to the moral to be deduced from them. The answer is of course ambiguous; for there never yet was an occurrence, from a revolution to a railway accident, upon which two different parties could not put two diametrically opposite interpretations. If facts are not deceitful, they are at least pressed with singular facility into the service of the most hostile theorists. The two lines of argument which may be adopted on the present occasion are obvious. The grumblers, who form the largest part of mankind, will naturally say, Here is another warning of the peril of Arctic adventure. The crew of the *Polaris* have, it is true, all returned safe and sound; but that is no proof that they ought not all to have been drowned, starved, or frozen. Men have returned in safety after passing through the fire of batteries, and at least one man has been picked up alive after riding over a perpendicular cliff two hundred feet in height. For all this, nobody in his senses would maintain that it was justifiable in any man to expose himself to a vehement cannonade without some overpowering reason, or that it was at all a desirable amusement to jump over cliffs when you can with any decency stay at the top. The gambler who has won a bet when the odds were enormously against him always fancies that his success is a proof of his judgment in running the risk; but a sower judgment declares that his folly was just the same, whether or not a particular occurrence upon which he had no right to count came in time to save him. Now the crew of the *Polaris* have unmistakably run very serious risks. It is easy to suggest fifty accidents the possibility of any one of which is undeniable, and any one of which would have led to their annihilation. The ship itself might have been crushed outright instead of only suffering serious damage; the flimsy boats in which both parties had to make their escape might have been lost in the thousand dangers of an Arctic voyage. If the Esquimaux had not turned up, if the Esquimaux had not brought with them abundant supplies of clothes and walrus liver, if the flocks of auks had taken a different line in their migration, if the *Arctic* had not fallen in with the remnant of the crew at the right moment—if, in short, a thousand other "ifs" had become realities instead of possibilities—Captain Baddington and Mr. Chester, the mate, might never have returned to tell their story. This is undeniable, but the reply is equally clear. Here, will say the lovers of adventure, was a ship which by all accounts was most scantily provided for a serious expedition. She had not, as she ought to have had, a companion; the crew were a mere scratch collection and the discipline was apparently loose till a sense of common danger strengthened its bonds. The crew was suddenly split into two fractions by an accident which, if it could not have been avoided by obvious precautions, was certainly so strange as to be very unlikely to occur. Everything, in short, was against the adventurers which well could be against them. If a few pieces of good luck turned up in the shape of auks and walrus livers, we must add that there never was an expedition which had not some chances in its favour. A continuous run of the worst possible luck would of course ruin any adventure; but that is not a contingency which need be taken into account by a bold man. We may therefore assume that the expedition, so far from being unusually favoured, had much more to contend against than need be calculated upon by men who would repeat the experiment. And yet we see the result. The captain died of apoplexy before the misfortunes happened; but that was an accident which might have happened to him in Massachusetts just as easily as in latitude 80°. But the rest of the party, down to the baby at the breast, did not so much as lose a hair of their heads. They all came back safe and sound, and their success, so far as it proves anything, proves that the dangers of Arctic adventure have been considerably overrated. Turn people adrift with so little provision as the refugees from the *Polaris*, and it might have been admitted even by those who are most in favour of such adventures that the loss of at least some members of the party was next to a certainty. We might have admitted that the accident would be fatal, and only have denied that it was likely to occur. What has happened shows that, even when it does occur, despair is so far from being justified that we have a good precedent for expecting the escape of the persons exposed.

Which of these lines of argument is sound? To answer this question we must appeal to wider experience. To reason from particular cases is confessedly unfair. The real way to test the safety of Arctic expeditions is to compare the whole number of adventurers with the number of casualties. The story of the *Polaris*

adds an item to the favourable side of the account. It is not a very large item, but no fair process of argument can prove that it is not on the whole an additional reason for encouragement. When we add the consideration that the expedition was certainly not so arranged as to be even up to the average conditions of safety, the argument becomes still stronger. Without, therefore, endeavouring to extract from the event more than it will fairly bear, we may say that, whatever was the argument in favour of Arctic adventure this time last year, it is certainly rather stronger now. We shall not at present go over again the arguments for making one more attempt to secure for the English flag the honour of being the first to be displayed at the North Pole; nor will we discuss the propriety of Government assistance. Perhaps in the next Session of Parliament this question will be decided by a different set of authorities; and they may come to a conclusion less influenced by a simple regard to pounds, shillings, and pence. We will merely suggest at present that nobody would complain of the same task being attempted by private adventurers. Indeed Mr. Leigh Smith is at the present moment on his way to or from very high latitudes, and he is surely setting a very excellent example before his countrymen. There are always, so we are told, any number of rich English gentlemen panting for a new channel for the display of their adventurous spirit. Why should not more of them attempt a feat in which they would have the sympathy of men of science and the chance of being lions on the very grandest of scales? A few thousands of pounds would be sufficient; and, considering how many thousands are spent upon the amusements of the richer classes and in fitting out, for example, the pleasure fleet which dares the dangers of the Solent, is it presumptuous to hope that some one more daring than his fellows will consent to run the risk of living for a few months on walrus liver and taking a passage back on a homeward bound iceberg? The grouse-shooting has been very bad this year; why not pursue the immense flock of anks to their home in the Northern snows? If killing something is an essential condition of rational amusement, there appears to be a chance of polar bears and musk-oxen even in the unknown seas "behind the North wind"; and perhaps in those unsophisticated regions they may have the merit of being as tame as a British pheasant.

What may be done by this generation we know not; but the story of the *Polaris* certainly suggests that our grandchildren are not unlikely to find a new pleasure-ground amongst the icebergs when the Alps have become too stale to be worth breaking their necks upon. Consider, for example, those three Esquimaux who turned up, as it may be said, "quite promiscuously" in the winter quarters of the *Polaris*. An Esquimaux is of course more acclimatized than the natives of England. But there seems to be no assignable reason why an Englishman, with the additional precautions suggested by civilization, should not be capable of going wherever an Esquimaux can lead him. If it is possible for these independent barbarians to stroll about in the Arctic regions in the middle of winter without any particular risk to life or limb, the problem of securing a reasonable degree of comfort in the Far North cannot be quite insoluble. We are inclined to expect that our descendants will look upon the old fogies who were deterred by dangers so familiar to them much as the Alpine Club of the present day looks upon their predecessors of the last generation who called the Matterhorn inaccessible, and made themselves heroes on the strength of an ascent of Mont Blanc. Trips round the world are coming into fashion as a pleasant way of spending a three months' holiday. In a short time trips to the Pole will perhaps be equally familiar and profitable. It is true that a new sense of enjoyment will have to be cultivated, which, in the existing difficulty of discovering sources of pleasure, is but an additional reason for making the effort. The Alpine precedent may be again quoted. A century or two ago everybody regarded the mountains as detestable phenomena, among which no reasonable man could venture who could stay at home; now a man writes himself down as insensible to natural beauty who refuses to go into ecstasies at the view of a lump of ice in the middle of summer. It is only extending the same process to learn to appreciate the charms of Arctic scenery. The glaciers of the North are incomparably greater, and ought to be grander, than the glaciers of Switzerland; and the Aurora Borealis provides a system of decoration far more striking than that glow of Alpine sunsets upon which so much poetry has been expended. The taste has not been actually developed, but we may distinguish its germs as already in existence. Meanwhile the race for the Pole is still open, and we should regard a diminution in the number of English entries as on the whole a more serious event than a falling off in the competition for the Derby. The *Polaris*, which was to be an awful warning to all adventurers, can certainly be no longer quoted in that sense; and if the moral may be stated too strongly on the other side, we may at least hope that it will rather whet than damp the desire for similar expeditions.

AGRICULTURAL UNIONS AND THE CLERGY.

THE principle of action which refuses to acknowledge defeat, and sees in temporary failure only a pledge of future success, is perhaps as old as human nature. But the forms of its manifestation may be found to vary greatly in different types of character. In one man its expression will be calm and dignified; in another, petulant, incoherent, and vindictive. The declining fortunes of a political party often give curious scope for its exhibition, and the

apparent setting in of a Conservative reaction just now affords an instance in point. Liberalism was conspicuously in the ascendant when in 1833 Froude and Newman chose their defiant motto for the *Zyra Apostolica*, "You shall know the difference now that I am back again," and there has been a good deal of this prophetic tone during the present autumn in the advice addressed to the English rural clergy by some Liberal speakers and writers, among whom the most prominent position belongs to the *Spectator*. The country clergy are for the most part Conservatives. This is a fact with which, however much or little we may deplore it, we have become tolerably familiar in the course of a good many years of experience, as well as from history. If the clergy, being Conservatives, act on the principles and follow the traditions of their party, there is very little reason for wonder, and very much less for the iminatory lectures and uncomplimentary epithets with which they have lately been favoured in the lump, without any discrimination between the persons who stick to the good old-fashioned grooves and those who are in their own judgment, and that of most other people, very steady and consistent Liberals. "Tros Tyriusve," it is all one; unless the clergyman accepts the particular shibboleth which it pleases his interrogator to propose, he is set down as a hopeless obstructive, "stupid" to the heart's core, "blind" in the very crisis of his fate, and sure "in five years"—the period, we suppose, when a new Government is expected to be worn out in its turn—to bring upon himself and all belonging to him disasters unknown and innumerable, as the immediate and certain consequences of his own obstinate pigheadedness. When we look to the special charges laid in the indictment upon which all this superstructure of regretful vituperation is founded, it appears that one great and main head of clerical offending, besides the Burials Bill and Education counts, is the attitude which the clergy are supposed to have taken in respect to the agitation connected with the Agricultural Labourers' Union and the actual or possible strikes which may take place under its auspices. "There never was in the whole history of the Church of England anything so unfortunate or so stupid as" this. Luckily the mischief has not gone so far as yet but that there is a way of escape for the inferior clergy. The bishops are past hope. One of their own number has already sealed their doom. Bishop Ellicott has lighted a slow match—a measured time-fusee—which "will in five years" (Dr. Cumming seems to have set a fashion for definite chronology in prophesying) "turn the bishops out of the House of Lords." But for rectors and vicars there is yet a chance. They have only to submit themselves to the direction of Mr. Arch, to become corresponding secretaries for the Labourers' Union in every country parish, and to place their glebe land (well stocked to begin with) at its disposal for co-operative farms, and then perhaps the Church of England may last their time in the rural districts. They are on their trial, and only hold their present positions on popular sufferance. They must not even express a personal opinion as to their likes or dislikes in any agitation which may arise. "As if that signified!" Probably the personal opinion of any private man or woman upon any political subject signifies very little, unless he or she happens to be a great owner of property in a small Parliamentary borough. But nevertheless most people do exercise the right of expressing their likes and dislikes on subjects of current interest; and in so doing they are not supposed to be assuming the functions of legislators. The impatient parenthetic sneer at any clerical expression of opinion, "as if that signified," has therefore a curious look, as though, in the secret judgment of the critic, it did signify a great deal. Such a commentary would certainly not have been provoked by a similar expression of opinion from the parish doctor, or local attorney, or even from the nearest county magistrate. The involuntary admission on the part of a censor of the clergy is at any rate suggestive. It is possible that a clergyman himself may feel that, rightly or wrongly, his official position does give a certain importance in local opinion to the expression of his own judgment; and that therefore it is more incumbent on him than on most of his neighbours to be very careful in forming such a judgment, and to weigh his words well in giving utterance to it when it is formed. He has lived, it may be, many years, and has gained some small experience of men and things since the days of his fervid undergraduate oratory at the Union, when he threw himself with the headlong impetuosity of a neophyte into the advocacy of the last now scheme for the instantaneous regeneration of society, which turned out, after the next Long Vacation, to contain, by an unaccountable oversight, certain conditions which made it impracticable, not to say ridiculous. It was easy enough for him then to withdraw from a false position; it might not be so easy now, nor could he hastily take up a false position with the same impunity or with the same freedom from mischievous consequences.

It is somewhat disappointing when we find a journal like the *Spectator*, usually so philosophical and so anxious to lift men above the level of ordinary human passions and opinions, adopting as the basis of an argument on this subject one of the commonest and most transparent of popular fallacies. An acknowledged evil exists; some one with sufficient energy and self-confidence to make himself heard has started up to proclaim a remedy; therefore it is the immediate duty of every one who would not be held to range himself on the side of the evil to accept this particular remedy as infallible, and to agitate for its universal adoption. Fortunes are made out of quack medicines on the strength of this logic; but the victories of medical and sanitary science are won by other means. Without any special knowledge

of the local details of an agitation which is confessedly deprecated by "landowners, magistrates, and others," besides clergymen, and which "is to be further pushed by four great torchlight processions" in one district of Somersetshire, most persons accustomed to the exercise of grave and sober judgment would pause before committing themselves to its support. Those indeed who chance to have lived "through the history of the last year's Somersetshire agitation" in the very heart of the district where it was carried on, instead of merely "looking back" at newspaper reports of it, can perhaps tell how agricultural labourers themselves have sternly kept it at bay, while they have sought, in conjunction with farmers and landowners, to meet existing social and sanitary evils by other means. But think of "torchlight processions" in an agricultural district for the "pushing an agitation" of labour against capital immediately after the harvest has been stacked! The *Spectator* "hopes" that these processions will be "at once orderly and successful as demonstrations." In what way a torchlight procession can be "successful," to take a familiar instance, as a "demonstration" against a tumble-down cottage held by lease on lives which the landowner cannot touch till the lease falls in, we do not choose to guess; and for the "order" of such demonstrations we should not like to answer. But perhaps it is unfair to hold the *Spectator* to any literal and customary meaning of words and phrases. The "Church," for instance, throughout last week's article is used as an expression exactly equivalent to "the clergy of all denominations," and "every true Church" seems to be much the same thing as "every Christian minister." We had ourselves imagined that this way of talking had passed out of date some thirty years ago.

"Bishops and clergymen who stand aloof" from this torchlight agitation seem to the *Spectator* "to abdicate their offices as clergymen, not less than to neglect their duties as men." There may in the world of life and thought be other points of view from which this question may be examined. The attitude which many of the country clergy may fairly claim the right to assume with reference to the questions affecting the relations of capital and labour as they extend from the towns to the country parishes may not improbably be the same as that which the town clergy have for several years past adopted, not without general approbation. This has usually been guided by the rule that the clergy should not become active partisans either on the side of employers or employed. If they have been influenced in this course to some extent by motives of worldly prudence, or of what Bishop Butler has called a "reasonable self-love," they are not necessarily blameworthy for that. Disputes between masters and men are very much like quarrels between husband and wife so far as the interference of third parties is concerned; and a truce may often be declared while the opposing forces unite to rid themselves of the presence of the interloper. Manufacturers and artisans not seldom coincide in the doubt whether the parson knows enough about the matter in hand to be able to form an opinion on its merits; and the parson himself may be disposed to agree with them, and to confine any expression of his own judgment in the matter to a friendly warning here and there against the risk of exchanging the frying-pan for the fire. It is quite possible that the personal sympathies of the clergyman may be enlisted on the side of labour rather than on that of capital. In a strike which is probably among the earliest, as well as among the most severe and protracted, within living memory, a country clergyman came boldly forward on the side of the men, and—it was forty-five years ago—was imprisoned for twelve months in the county gaol as a consequence. His zeal had outrun his discretion, but there are many clergymen now who in a clear case of right against wrong would risk the same penalty. A country clergyman may, however, with some reason hesitate to allow that the relation of the labourer to the work, and therefore to the employer, stands on the same footing in the two cases of ordinary manufactures and of agriculture. He may think that a product which may be obtained at any time, and which is not an immediate necessary of life, may be dealt with in accordance with other laws than will apply to products which depend absolutely on the conditions of seasons and of weather, and which are the staff of human and animal life. He may therefore feel himself, and may recommend to others, very much greater caution and deliberation in raising or sanctioning a movement which applies the principles of the Trade Union and the possible pressure of strikes to agriculture than he might think necessary in the case of a manufacturing industry. At any rate, if his opinion confessedly "signifies," in the judgment of his censors themselves, he is bound to be especially circumspect in all that he says or does upon the question, and to take the risk of such hasty criticism as the exigencies of a political crisis may bring upon him. The consolations of modern prophecy are no doubt materially enhanced when the prediction of the better time coming can be coupled with some good mouth-filling denunciations of the "proud oppressors" who for the moment happen to be in power. But it may be as well to bear in mind that an oracle, when oracles were in fashion, lost none of its authority by being discreetly vague; and a prudent prophet will take care to qualify his predictions, even at the cost of some sacrifice of their force, by leaving for himself an explanatory hole to creep out at, if the course of events should prove perversely at variance with the more obvious interpretation of his words.

THE OLD CATHOLIC CONGRESS AT CONSTANCE.

THE third Old Catholic Congress, which closed its sittings on Tuesday last, derives a peculiar interest from the place and the period of its assemblage. The first had met in 1871 at Munich, responding to the challenge thrown down to Catholic Germany in Dr. Döllinger's famous manifesto; the second, last year at Cologne, when the movement originating in Bavaria had spread to the North and was making itself felt in the very heart of the Catholic Rhineland. This time the scene has again been shifted from North to South; but instead of returning to Munich, the Congress has migrated, in view of the extending area of the constituency it represents, to the confines of Switzerland. Hardly any Swiss deputies were present last September at Cologne; but since then the progress of the movement has been so rapid, especially in the dioceses of Basle and Geneva, that already several parishes have passed into the hands of the Old Catholics, and a preliminary Conference was held on the 31st of August at Olten, as well as to select representatives in compliance with an invitation issued by the Central Committee to attend the approaching Congress, as to discuss plans of national Church organization and the erection of a national bishopric. There was, therefore, a local as well as historical fitness in the selection of Constance this year as the place of meeting, and the vast *Concilium-Saal* on the shore of the Lake, named from the great reforming Council of the fifteenth century which sat within its walls, afforded every facility for the purpose. Nor was the time less significant than the place of assembling. At the two previous Congresses the movement was passing through a tentative phase, and it has only within the last few weeks completed its essential organization—for much, of course, still remains to be done—by the election and consecration of a Bishop. Just before this last event the venerable Archbishop of Utrecht, who occupied so conspicuous a place at Cologne, had passed away, and the Anglican prelates who were then present have been obliged this year to content themselves with expressing their sympathy by letter. But their absence was evidently felt to be more than compensated by the appearance of Bishop Reinkens, who met with a most enthusiastic reception. Two American prelates, Bishop Doane of Albany and Dr. Lynam, Bishop-Elect of North Carolina, were present, and the Archbishop of Syra and Bishop of Haarlem wrote, like the Bishops of Winchester and Lincoln, to testify their regret at being unable to attend. All the great German leaders were there, with the exception of Döllinger, whose personal counsel was the less urgently needed as the movement has now passed beyond its theoretical stage, the principles and theological basis of Old Catholicism being already defined; and this third Congress was occupied exclusively, as the second was principally, with the settlement of practical details. The Anglican Church was represented by Dr. Howson, Dean of Chester—who has expressed in a letter to the *Guardian* his warm admiration for those "kings of men," Schulte, and Bishop Reinkens—Dr. Heidenheim, English chaplain at Zurich, and several other clergymen. Dr. Michaud and Dr. Pressensé represented the Catholics and Protestants of France; two Archpriests came from Russia, and Professor Holzmann spoke for the German Protestants, or rather Nationalists, whose sympathy was of course of a very general and negative kind. Father Hyacinthe was among the deputies from Switzerland, and three ecclesiastics attended from the Church of Holland.

The order of proceeding seems to have been much the same as on previous occasions. A friendly soirée, at which informal addresses were made and greetings exchanged, was held on the Thursday evening; the business sittings occupied Friday and part of Saturday, and public meetings, attended by many thousands, were held on Saturday and Sunday afternoon. On Sunday morning Bishop Reinkens preached an impressive, but entirely uncontroverted, sermon to an immense congregation at High Mass at St. Augustine's Church. One innovation was made this year, by admitting ladies as guests, though not as delegates, to the sittings of the Congress; about fifty of them were present on Thursday evening at the preliminary reception in the Council Hall, and a larger number at the dinner given to above three hundred guests on Saturday evening. Herr Wiesen, who presided on Thursday, welcomed the guests in a few graceful words, and referred to the solemn associations of the chamber in which they were assembled. The Bishop of Albany then spoke in English, to convey the greetings of the American Church, observing that he had himself proposed the address of sympathy with the movement in the General Convention. He referred to the close union between America and Germany, which would, he trusted, be cemented in the future by the more intimate bond of religious unity, and said that what chiefly struck his fellow-Churchmen in America was the combination of courage with patience and wisdom displayed by the Old Catholics, especially by their priests. The Archpriest from Moscow followed, and then Professor Holzmann, after which the Abbé Michaud delivered what is described as a speech of passionate eloquence on the position and prospects of the cause in his own country. He assured his hearers, from his own personal knowledge, that there was a large number in France, even among the clergy, who were with them at heart, but under the double pressure of ecclesiastical and civil restraints did not as yet dare to avow themselves; nor are Old Catholics permitted by the existing French law to meet for worship except in private. Dr. Heidenheim and Dean Howson then briefly conveyed to the meeting the assurance of English sympathy, the Dean claiming to speak expressly for the Bishop of Winchester. Bishop Reinkens finally responded to the many kindly greetings he had received,

and expressed his confidence in the future growth of the movement under the Divine blessing which had so signally attended its course hitherto. Their organized congregations already amounted to over 50,000, whereas when he took counsel with his friends at Nuremberg in August 1870 they were but fourteen.

The real business of the Congress began on Friday morning, when Schulte was for the third time elected President and opened the proceedings by the delivery of a long and forcible address, recounting the steps taken by the Committee appointed at Cologne to provide for the election and consecration of a bishop, and their negotiations on the subject with the Archbishop of Utrecht and Prince Bismarck, which last had been of the most friendly character, and would result in a few days in the formal recognition of Bishop Reinkens by the Prussian Government, which is now reported to have actually taken place. The speaker then reviewed the present statistics of the Old Catholic body in Germany, and showed that, while there were 22 regularly organized congregations in Prussia, 33 in Bavaria, and 27 in Baden, numbering altogether over 50,000 members, they had in fact not less than 200,000 devoted and zealous adherents in the Empire, and many more were waiting to join them. No such progress as this had been made in the early years of the Reformation, and the present movement had to fight its way in an age when Ultramontane corruption had deeply infected the Church with materialism and indifference. In Italy, according to the account given by Bonghi, two-thirds at least of the people were open infidels, while scepticism and fanaticism disputed possession of the remainder. These things should be remembered when the conventional claim of the New Catholics to "two hundred million" adherents was so glibly repeated from month to month. Letters of sympathy from foreign bishops and others were then read, and an invitation from the American Evangelical Alliance, signed by Dr. Schaff, and asking the Congress to send three representatives to a meeting to be held next month at New York. Schulte pointed out the practical difficulties in the way of complying with this suggestion at so short a notice, but a reply was drawn up giving emphatic assurances of the intention of the Old Catholics to proceed in the work of reform. The business transacted at the Congress, as we intimated just now, was of a purely practical kind. The scheme of Church law drawn up by the General Committee was adopted with slight modification, but expressly declared to be "provisional," as the present state of things, while all the episcopal sees are in the hands of infallibilists, can only be considered a transitional one, and the Old Catholic body in Germany does not claim as yet to be more than a single diocese; not a province, still less a national Church. These rules provide for the constitution of the Episcopal Synod, with the bishop at its head, consisting of all the priests under his jurisdiction, and a lay delegate for every two hundred members of the congregation. It is to meet once a year, at Whitsuntide, or oftener if summoned by the bishop and his Council, the Council being chosen by the Synod, and consisting of four priests and five laymen, one of each order retiring every year. The bishop will be elected by the Synod, but from a list of names proposed by the Council, and he is to appoint a Vicar-General to act in his absence or during a vacancy. Every congregation is to elect its own pastors, who are to be confirmed by the bishop, but they are not to be removable, except by canonical process, and for a proved offence against the faith or discipline of the Church. Resolutions were also passed, providing funds for the education of students for the priesthood, which Bishop Reinkens declared to be a matter of pressing importance, and the more so, as Professor Knoodt and others insisted that clerical education in Germany during the last ten or fifteen years had sunk so low that "New Catholic priests" who joined the movement would not be qualified for parochial cures. The offertory collected at the English service on Sunday, where Dr. Lyman and Dean Howson officiated, was devoted to this object. There was a good deal of warm discussion on these and other practical details, as also on a proposal of Dr. Michelis, one of the most vigorous spokesmen of the movement, to take immediate action in the matter of reunion, instead of simply continuing the permanent Committee appointed last year at Cologne to deal with the subject. He wanted to have two Committees formed—one to sit at Munich, and enter into communication with the Eastern Churches, the other to sit at Bonn, and communicate with Christian bodies in the West; the two meanwhile maintaining close relations of mutual intercourse, and both alike being ready to enter into negotiations with the German clergy of different confessions. It was eventually determined to refer the matter to the Episcopal Council.

There does not seem much to call for criticism, at least from an outsider, in the measures adopted by the Congress, which were confessedly tentative and provisional, all really important questions being adjourned for the consideration of the future Synod. An official report will of course appear in due time. Meanwhile it is obvious to remark on the business-like character of the whole proceedings, and the quiet confidence and calm common-sense view of their position and duties which appear to have animated those who took part in them. Reinkens was evidently regarded on all sides as pre-eminently fitted for his position, and it can hardly fail to conduce materially to the success of the rising community to have such a man at its head. Schulte was himself careful to explain that he considered his own responsibility for the movement almost at an end. For the last three years he has laboured indefatigably at its organization, which is now so far completed that henceforth the conduct of affairs passes into the hands of the

bishop and his Synod, which is to meet next Easter. Nor did Reinkens shrink from assuming the leadership thus devolved upon him. It was observed that, while the political and national aspect of the question seemed to be uppermost for the moment in the minds of the lay speakers at the Congress, who felt the urgent practical importance of securing the recognition of the Prussian Government, the Bishop lost no opportunity of insisting on the essentially religious character of the conflict in which they were engaged. His closing speech at the public meeting on Saturday was an emphatic vindication of the popular use of the Bible. But the critical period in the history of the movement is yet to come. To destroy is always easier than to construct, and hitherto, from the necessity of the case, protest and resistance have been the order of the day. With this third Congress, which has laid the foundation of a disciplinary system, a new era opens. The work already accomplished only professes, indeed, to be elementary and provisional; but in such cases much depends on the first start. The example of Father Hyacinthe, who has already settled the question of clerical celibacy and mass in the vernacular on his own hook, so to say, is enough to show that there are some very unruly spirits among even the prominent spokesmen of the party. And although their organization is independent, and the Swiss deputies took no very prominent part in the recent Congress, there is a pretty close solidarity established now between the Old Catholics of Germany and Switzerland. Dr. Schulte reminded his hearers, with pardonable pride, of the far greater advance made in three years by the present movement than was achieved in a much longer period by Luther. There is one homely lesson, however, which may profitably be learnt from the experience of the German Reformation when once it did begin to advance, which is conveyed in the familiar proverb, *Festina lente*. As long as men like Schulte and Reinkens are able to retain the control of affairs, there is not perhaps much danger that the warning will be forgotten.

CONFEDERATED HOMES.

THE British Association seems to think itself entitled to take cognizance of all those subjects over which another body of philosophers has in recent years assumed a special supervision. It is perhaps rather hard upon the Social Science Congress, which will meet next week, to be anticipated in the discussion of such eminently social subjects as cookery and household work; but we must nevertheless admit that Mrs. King at Bradford had something to say upon these subjects which deserves attention. This lady, who is, we believe, American, describes English maid-servants as living in semi-slavery, and she insisted on their right to enjoy the society of men. We understand her to mean that mistresses ought no longer to object to "followers," nor to express displeasure at flirtations between their maids and the baker or policeman. Her proposal for "confederated houses" implies that masters and mistresses and their children are to live under one roof, and servants under another. Except at fixed hours, or in special cases, the luxury of ringing the bell will have to be renounced, because there will be nobody on the premises to answer it. A family will live on the same plan as a single man at Oxford or Cambridge, to whom a scout or bed-maker comes at certain hours to do necessary work and then departs. Mrs. King appears to consider that economy of labour would result from her plan, and probably to some extent she is correct. We see how quickly the work of cleaning and putting rooms in order is performed in a large hotel, and we might safely assume that the same quantity of work is done more slowly in private houses. Of course in a large hotel they do not clean for cleaning's sake, or because it is Saturday, but merely do what is wanted, and no more, or even less. One obvious advantage of Mrs. King's plan would be that the trouble and difficulty of feeding servants would be got rid of, and master and mistress would be at liberty to demean themselves by eating Australian meat if they were so inclined. It is perhaps premature to speculate on the introduction of the ubiquitous Chinaman into England, but in some countries which were colonized from England he does nearly all the domestic work there is to do, and he comes at fixed hours to do it in houses where his residence would be intolerable. The "confederated homes" which Mrs. King proposes would, we presume, be arranged on the principle of what are called flats, and it would hardly be convenient in a flat to do without one servant unless the lady of the flat could undertake the duty of saying that she was not at home to disagreeable visitors. This, however, is a detail which would adjust itself. It would be easy to appoint one evening in the week for being at home, and to decline to receive all but necessary visits at other times. If the system of "confederated homes" should promise to produce the abolition of morning calls, that would be a clear advantage. It would be part of such a system to have gas and water laid on at every floor, and to employ lifts for raising coals and other heavy weights, instead of having them carried up by servants. Ladies, we believe, find life in a flat, where the windows look out on nothing, very dull; but perhaps if they undertook a share of domestic work this deprivation would be less serious. Mrs. King indeed suggests that the cheerfulness and pleasure of the inhabitants of "confederated homes" would be promoted by neighbourly intercourse; but that is hardly consistent with the habit of London, where it has been usually accounted a convenience that you need not know your next-door neighbour. Mrs. King thinks that in "confederated homes" the want which young men and young women feel of social intercourse and variety

of amusement would be met naturally and healthily. But mothers might perhaps regard the probable consequences to their daughters of this social intercourse as dangerous. Of course, if we could choose our neighbours, all would be delightful, but then we could not.

The reports of Mrs. King's paper are imperfect, and perhaps it may have had a more practical aspect than these reports exhibit. But she certainly seems to us to take too little account of obvious difficulties. Thus she says that, "with combination in cooking, we could afford to have an artist to guide and direct the staff of inferior cooks." This sounds like a proposal for dinners and suppers in a common hall, which, however economically justifiable, would be destructive of domestic comfort. If there is to be a separate dinner or supper in each "home," there must be at least one person in that home to cook the food and serve it up. If the mistress of the "home" can and will do this, so much the better for herself and her husband; but much training both of the wife who cooks and of the husband who eats would be needed to produce a satisfactory result. In order to deal completely with this branch of the subject of "homes," it would be necessary to investigate first principles. We must begin by inquiring what is a dinner? The English notion of a dinner differs from that of almost all the rest of the world, and it is to be feared that our devotion to roast beef would be fatal to any project for economizing labour in the kitchen. It is true that you can get roast beef in almost any Continental country, but then it is not roasted. In England we demand large joints roasted before a large fire. In France it is usual to cook no more meat than is likely to be eaten, and to employ no more fuel than is absolutely necessary. Thus if the mistress of a French "home" undertook to dress dinner for her family, she would neither be required to handle such heavy weights nor to expose herself to such a degree of heat as in an English kitchen. She might dress a dinner sufficient, according to French ideas, for herself, her husband, and children, with only such assistance as she could get from an intelligent girl or boy. We do not suppose that a man of education and refinement would desire that his wife should habitually cook dinner for his family, but still it is useful to consider what is possible. The important point to observe is, that economy in food, fuel, and labour go together. We had forgotten to observe that the "homes" might be warmed in winter by heated air, so as to dispense, at least partially, with the wasteful practice of burning coals in open fireplaces. This, again, would be a change abhorrent to the feelings of many English men and women, but the high price of coals will compel it. If we cannot alter our own habits, we had better bring up our sons and daughters to accept a stove as a substitute for the sacred fire of the domestic hearth.

It cannot be doubted that "the organization of labour" might to some extent be applied to domestic purposes by means of these "confederated homes." We understand that an attempt has been made to introduce the principle of common servants in a block of new buildings called Belgrave Mansions, where lifts are used to economize labour. These mansions are stated to be so far a financial success that they are always full, but "they are not the social success they ought to be only because they are managed in the interest of the proprietors for the sake of profit, instead of, as they ought to be, in the interest of the tenants." The gentleman who gave this information to Mrs. King seems to have adopted a new and harmless form of socialism. If he expects landlords of house property in London to manage it in the interests of anybody but themselves, he possesses the inestimable advantage of a sanguine disposition. If his words have any meaning at all, they imply that the proprietors ought only to let apartments or flats in these mansions to those whom the tenants, or rather the tenants' wives, could agree in considering "nice" people. This is an extravagance of tenant-right which could hardly have been invented even in Ireland. We suppose that the alleged want of social success in these mansions consists in this, that the occupants entirely decline to exhibit any sociability with one another. This is a difficulty which we fear cannot be removed by reading papers in sections. Mrs. King remarks that the English are sociable abroad, and asks why they cannot be the same at home. The obvious answer is that they are sociable abroad because they are not at home. It is said that when the plague raged under King Charles II. the Duke of Buckingham took refuge in the country, where he made himself so agreeable to his tenants that, when he was leaving, they inquired when they should see him again. The Duke answered, "Not till the next plague." So we are mutually agreeable abroad because we know that we can cut one another at home. If we met our actual next-door neighbours of a London street, we should probably be cautious about speaking to them even in a Swiss hotel on a wet day.

The discussion which followed the reading of Mrs. King's paper was even more barren than the paper itself in practical suggestion. One speaker regretted that modern life entirely severed the husband from the wife in matters of business. If this remark referred to what is commonly called London, it should be remembered that modern life during the hours of work is, in a large and increasing number of instances, transacted by the husband at a distance of five or ten miles from his wife. We might almost say that nobody, either principal or assistant, lives in the City of London, where an enormous mass of business is transacted. It may well be that the character of that business has been affected by the circumstance that it is transacted almost entirely between the hours of ten and four o'clock in the day. Rapidity and despatch have been attained in business, and Mrs. King thinks that this is equally desirable in household work; but perhaps in both cases

there is something to be said on the other side. As regards the wish expressed by a speaker, that wives might resume their positions as assistants and advisers of their husbands, it is to be remarked that marriages in England are apt to produce a number of children, and it is thought by some social philosophers that family and household duties ought to engage more of the time and thoughts of wives than they do at present. Miss Becker, on the other hand, being, as might be expected, in the van of progress in these matters, would carry the organization of labour to the extent of entirely superseding what she calls "domestic drudgery." Women, she says, are expected with their own hands to make the clothes of the family, and this is "a most uneconomical employment of labour." We should be inclined to accept Miss Becker's words, although not exactly in the sense in which she used them. It would be a very uneconomical employment of labour if women in general were to make their husbands coats or trousers or shirts, because nothing is so wasteful as a misfit. But we see women constantly employed in needlework which appears to the uninstructed eye of man to have some application to the clothing of herself or somebody else. A husband goes into the City by train, and a wife, after supervising (very ineffectually as Mrs. King would say) her house and kitchen, sits down to needlework, and finds therein sufficient occupation until her husband returns. If the organizers of labour take away the needlework and leave the wife, what is she to do? Mrs. King appears to contemplate that very superior women—so superior, in fact, that men are almost afraid to marry them—would be the heads of the proposed organization of labour, and those who desired employment in domestic work would take service under them. A married woman might perhaps govern a corps of housemaids and cooks; but her duties and opportunities of usefulness as a wife would rather be diminished than increased under the new system. Mrs. King sneers, and perhaps justly, at lectures on cooking to ladies, which she calls playing with the frying-pan. But it is beyond doubt that Englishwomen of the middle class possessed in the last century a knowledge and practice in domestic work which to a great extent they have lost now. We may remember that Mrs. Beecher Stowe ascribes to a lady of New England the habit of arranging her own bedroom, and this habit was probably carried by the early colonists to America. The superior skill of Frenchwomen in domestic matters has been very forcibly described in a recent publication. If this model is too high for Englishwomen, they may at least endeavour to imitate their own grandmothers.

THE BATTLE OF NIEUPORT.

THE battle of Nieupoort, fought in the last year of the sixteenth century, was one of the most famous fights of the long war which won the independence of the United Provinces. As a military exploit it is one of the most remarkable on record. An army which seemed doomed to destruction, which at one point of the battle was on the very brink of destruction, turned about and won a complete victory. And the battle is one which must always have a special interest for Englishmen. English troops, led by an English commander, took a leading part in the fight. And it was one of those days which come home more closely to us than many of the days when Englishmen have won glory in Continental warfare. At Nieupoort Englishmen were not only beyond all doubt fighting in a good cause; they were also fighting side by side with the nearest of our Continental kinsmen. Those of the great family who ages before had crossed into Britain, and those who had stayed behind on the mainland, were there working in one common cause against the enemies of the religion and freedom of both. This of course is true of every time through the whole war when Englishmen took a part in it. Everywhere in the United Provinces, everywhere along the whole coast from Flanders to Sleeswick, we are among near kinsmen. But none are nearer than those with whom the English were placed in the closest fellowship at Nieupoort. Along with the English fought the Frisians; men nearer to us even than any other of our kinsfolk of the Low Countries; men who, scattered along the various points of that long coast, had everywhere shown themselves the stoutest defenders of freedom, and had everywhere kept firmly to a tongue differing less from our own than any other form of Continental speech. When at Nieupoort we find Englishmen and Frisians acting specially together, when we read in Grotius "*in primori acie Anglos Frisiosque Varius tuebatur*," we feel carried back to the days when Irokipos classed together *Ἰνδοί and Ἰσπανοί* among the inhabitants of our island. And it certainly is not pleasant, it jars somewhat on the old family harmony, to find a distinguished writer of English blood and speech in their third home going out of his way to depreciate hastily, to say the least, the character and services of the man who led the English contingent on that memorable day.

The battle of Nieupoort fills a conspicuous place in the early part of the fourth volume of Mr. Motley's *History of the United Netherlands*. It was the beginning and ending of an expedition designed in the year 1600 by the States-General, with Barneveldt at their head—rather, it would seem, against the counsels of the stadholder Prince Maurice of Nassau—into the obedient provinces, the provinces which had fallen back under the dominion of Spain, and which were then ruled by Philip's daughter Isabella and her husband, the Archduke Albert. Ostend, presently to become the scene of almost the most famous siege in history, though already threatened, was in the hands of the States, and, if they could get hold of Nieupoort, they would

have had the command of nearly the whole Flemish coast. They would most probably have been able to put an end to the piracies of the men of Dunkirk, and to cut off the Archdukes from any communication by sea. As an expedition the enterprise failed utterly: Nieuport was not won, nor was any solid advantage gained; but the army of the States, surprised and threatened as every one thought with utter overthrow, came back bringing with them the glory of a battle wonderfully gained, though bringing with them nothing else.

In this battle the English troops were commanded by Sir Francis Vere, one of the most eminent of those great English soldiers of the Elizabethan age who learned experience in Continental warfare and handed it on to the men who were to show themselves their disciples in the civil warfare of the next age. Vere took a leading part in the battle; he was severely wounded there, and he wrote an account at least of his own share in the business. That account Mr. Motley brands as untruthful, and he deals harshly with Vere's conduct altogether, allowing to him no praise beyond that of mere personal courage which he doubtless shared with every man under his command. But if he has thus been, we must say unfairly, dealt with by an English writer beyond the Ocean, Vere has not failed to find a more immediate countryman ready to come to his defence. Sir Francis Vere was the military teacher, and by marriage the uncle, of Thomas Lord Fairfax, and he being so, Mr. Clements Markham, as the biographer of Fairfax, feels bound to him by a certain secondary tie of allegiance. In his geographical periodical *Ocean Highways*, which we cannot help thinking would do better to keep to its second title of the *Geographical Review*, Mr. Markham has undertaken a series of articles on Military Geography, a series of scientific examinations of the sites of many battles and sieges, which will be a really valuable contribution to history. Mr. Markham, it will be remembered, has already done something in this way in the very clear maps and plans which accompanied his *Life of Fairfax*, and which, with the general vigour of his military narratives, led us, when we reviewed his book, into a mistake as to his profession. The mistake was not so bad as when a reviewer of Mrs. Davies's *History of Holland*, struck with the vigour and accuracy of her military descriptions, fell into the trap laid in the title-page—where the author gave no further description of herself than "C. M. Davies"—and cried out admiringly, "There can be no doubt as to what is Mr. Davies's profession." We have since learned that Mr. Markham's own services to his country were done by sea and not by land, but it is not the less plain that he has given a good deal of attention to the science of warlike operations on shore. We are glad therefore that he has undertaken this series, and we do not complain that, evidently jealous for the fame of one so closely connected as Sir Francis Vere was with his own immediate hero, he has chosen to begin with the battle of Nieuport.

Our readers will hardly expect us to enlarge here on every point in dispute between Mr. Motley and Mr. Markham; to do so would come to nothing less than a minute military examination of the battle. But we may point out that Mr. Motley's insinuations against the general good faith of Sir Francis Vere fall utterly to the ground. We allow that Vere's account as to certain advice given to, and either refused or followed by, Count Lewis Gunther of Nassau does not exactly agree with that given by Count Lewis himself. But Mr. Motley himself, as the Duke of Wellington did before him, remarks that no two persons, even eyewitnesses and actors, ever give exactly the same account of a battle. We might be inclined to add that what is true of a battle—the Duke adds, of a ball—is also true of everything else. It is far more likely that Sir Francis Vere and Count Lewis Gunther did not fully understand one another than that either of them wilfully failed either to do his duty in the battle or to report it faithfully afterwards. But if we are to choose between one and the other, the particular reason which Mr. Motley gives for preferring the narrative of Count Lewis is at once falls to the ground. Mr. Motley says that the accounts written by the Nassau princes were not meant for publication, but only for their own friends. Sir Francis Vere, he tells us, wrote and published a party pamphlet for his own purposes, to make much of himself and his own troops, and to depreciate the services of their comrades of other nations. Mr. Markham, on the other hand, shows that Vere's narrative was of exactly the same kind as those of the princes; it was a narrative written for his own friends, and which was not published till more than fifty years after the time, when he had long been dead. Mr. Motley too, for some unexplained reason, always quotes Vere in French. He seems not to know of the English original which Mr. Markham uses, nor does Mr. Markham know where Mr. Motley got his French translation. We must confess that we unite in ourselves the deficiencies of both our authors; we know Vere's narrative only through the extracts which they have given us, as neither of them tells us where the narrative in full is to be found. But so far as we can judge in this imperfect way, we do not see any signs of that jealousy of the other parts of the army and their commanders which Mr. Motley attributes to him. Mr. Motley complains that Vere does not mention the gallant action of Count Ernest at Iffinghen just before the battle of Nieuport. Now, according to Mr. Markham, Sir Francis Vere's "Commentaries" are "narratives of 'diverse pieces of service in which he had command.'" Vere had no command at Iffinghen, and the Stadholder Maurice actually kept what had happened at Iffinghen secret from Vere and the rest of the army. This may perhaps account for his silence. And certainly, when Mr. Motley charges Vere with exaggerating the services of the English, and attributing

to them the chief honour and the chief loss in the battle, we must say that Mr. Markham's defence of Vere's statement is fully born out by the words of Grotius to which he does not refer:—

E victore exercitu nullo ferme desiderati, proter quos Ernestus amiserat: maxima pars Angli, quorum promptissima fuerat virtus, ejus gentis centuriones octo in pugna occubuerant, ceteri omnes vulnerati extra duos. (The names of most of these officers are given by Bor, iv. 653.)

Mr. Motley also says that Vere is not to be believed, because he represents the army as having been two or three days in the neighbourhood of Nieuport before the battle, whereas, according to Mr. Motley, the Stadholder only got there one day and the battle was fought the next. Mr. Markham shows that there is no contradiction, as the army did not come all at once. Bor (650), who speaks most honourably of Vere, shows that the Stadholder and the Count of Solms came on different days. Altogether, from such evidence as we have before us, Mr. Markham seems quite to have made out his point, and Mr. Motley is at least bound, as Mr. Markham suggests, to consider the matter afresh in future editions of his history.

Mr. Markham's map brings clearly before our mind the wonderfully small space in which the battle was fought. If we have rightly used his scale of yards—for it is a matter of yards and not of miles—no part of one army was so much as half a mile away from the furthest part of the other. The battle and the whole story is one which is eminently worth studying, and it is quite worth while to compare the accounts given by Mr. Motley and Mr. Markham with one another and with those of writers nearer the time. Though the victory did not lead to the great expectations with which the States-General sent forth the Stadholder and his army, yet the defeat of the renowned Spanish infantry in open battle was no light matter. Grotius gives a number of picturesque details, many of which are followed by Mr. Motley; and Grotius too points out a curious coincidence that the battle of Nieuport, in which an Albert of Austria was overthrown by a prince of Nassau, was fought on the anniversary, and narrowly escaped being the tercentenary, of the battle of Göttingen, where, on July 2, 1298, an earlier Albert of Austria had overthrown King Adolf, up to that time the only King of the House of Nassau, the King who, under a higher title than he had any right to, is still so highly revered among the ale-houses of his own county:—

Veterum curiosi annotabant ferme tribus ante sæculis Albertum Austriacum Adolpho Nassavio congressum vitam imperiumque rapuisse eundemque nunc die, quæ est postridie Sextiles (?) calendæ, mutata domum fata.

THE THEATRES.

WE could have little to say upon the opening of Drury Lane Theatre, and that little has been said already. The *Pall Mall Gazette* has described Mr. Chatterton's undertaking as "the revival of Shakspeare on *Babil and Bijou* principles," and we cannot improve upon this language; which, indeed, we should ourselves have used if we had not been anticipated. As Mr. Puff says, two persons happened to think of the same thing, and one of them was the first to publish it. We fear, indeed, that the same thing must have been thought of by many other persons who had no opportunity of publishing it. It is melancholy to remark that this comparison was obvious and inevitable. We do not blame Mr. Chatterton for dealing thus with *Antony and Cleopatra*, nor can we praise his work. He promises a pantomime at Christmas, and, considering that his company are rehearsing for it every night, the production ought to be successful. In our view it matters not whether a ballet be called Egyptian or Roman or what else, as the same persons will do the same things whether the reputed author of the piece be Shakspeare or Mr. Blanchard. If we could have the tragedy or what is left of it first and the dances afterwards there would be an economy of time and patience. We were about to quote the story of the housekeeper who desired the dairyman to let him have his milk and water in separate jugs; but doubtless this story has been already quoted in this connexion. In fact, all figures of speech and forms of language applicable to the miserable condition of the English drama have been exhausted, and we have become weary even of expressing weariness.

It is only fair to Mr. Chatterton to acknowledge that his predecessors in management would doubtless have resorted to the same artifices that he uses if they had been available; but we do not think they would have relied upon them so exclusively. The depressing feature of modern management is its hopeless, unvarying monotony. We are told that the play which Mr. Chatterton has selected for his experiment was produced in 1758, "with scenery, dresses, and decorations expressly designed to fulfil the same purpose as that aimed at by the modern manager," who has better appliances at his disposal. We believe this statement is correct, and we believe also that, as the experiment of 1758 did not succeed, the bill was changed within a few nights. The habitual playgoer, if any exist, cannot hope for such luck now. It is fortunate that the free admissions of the renters of the theatre are transferable, for we should fear that a protracted course of spectacular Shakspeare might otherwise drive some sensitive renter into a madhouse. If there were upon the stage an actress equal to the part of *Cleopatra* we might desire to see her in it more than once; but we could hardly bring ourselves to undergo a repetition of "the path of flowers" and other business of the *Babil and Bijou* kind. If Mr. Chatterton expected to realize the promise put forth on his behalf in the *Daily Telegraph*, he must be disappointed. It is not possible "to gratify equally the ad-

mirers of elaborate stage effects and the appreciators of dramatic poetry—at least not upon the same night. But it would be permissible in the manager of a theatre which aspires to be national to address himself to different tastes on different nights. As he has engaged some actors of talent and experience, he is not absolutely without the means of importing variety into his programme. He might try the effect of performing a non-spectacular play—as, for example, *Julius Cæsar*, once a week. The part of Antony in this play is well suited to Mr. Anderson, who used to stir up the East-enders effectually when he played it at the Standard Theatre. The skill of Mr. Ryder as a speaker would be well shown in the same play. The pit and galleries would certainly encourage such an experiment, and it would be useful in affording the company a change of parts. Mr. Chatterton must be aware that he has hardly found an actress equal to the difficult task imposed on her, and it might occur to him that in the seven years of his management he has done little to supply the void which he is now experiencing. We do not blame him for managing his theatre on a paying principle, but when his supporters in the press ascribe to him “judicious administration of the national theatre,” it does not seem unreasonable to notice that the position claimed involves a duty. Much has been deservedly said in praise of the talent of the young lady who plays Cleopatra, and it is a serious drawback to the development of that talent to deprive it of all variety of exercise. Mr. Chatterton, who possesses “a keen appreciation of the requirements of the modern playgoer,” may perhaps discover in time that one play of Shakspeare is as good as another, provided it includes a ballet, and thus out of the monotony of which we complain may be evolved the variety which in recent years we have hopelessly desired. We do not, indeed, at this moment see our way to introducing a ballet into *Julius Cæsar*, but we quite believe that Mr. Halliday and Mr. Cornuck could manage this between them. There is a dance of “Amazons” at Drury Lane Theatre as there has been in every piece, whether pantomime or tragedy, produced within the same walls during the last two years; and if, as appears likely, any piece may be made popular by the same method, the manager may look forward to a long career of “spectacular Shakspearian” prosperity. He will continue to appeal “to the eye and the senses as well as to the understanding,” and it may be hoped that “the path of flowers” (manifestly artificial) will lead to wealth.

Mr. Halliday says that he has addressed himself to the task of representing “the passion of the single pair” of lovers. But this is exactly the task which Dryden undertook and performed. Dryden announced in the prologue to *All for Love, or the World Well Lost*—

He brings a tale which often has been told,
As sad as Dido's, and almost as old.
His hero, whom you will his bully call,
Bates of his mettle, and scarce rants at all.
He's somewhat lowd, but a well-meaning mind;
Weeps much, fights little, but is wondrous kind.

I could name more; a wife and mistress too,
Both, to be plain, too good for most of you;
The wife well-nurtured, and the mistress true.

The unities, as to which Mr. Halliday is supposed to feel anxiety, are observed by Dryden only too carefully. It would not suit the modern manager to be allowed only a dance of Egyptians in the way of embellishment; but “the gorgeous spectacle of Cleopatra in her State barge” might be introduced into Dryden's play as unceremoniously as into Shakspeare's. Mr. Halliday gives the scene in which Antony tells Cleopatra that he is going to Rome, and he allows both lovers to speak words by which Shakspeare meant to mark the moment of parting. It is, however, not impossible for a lady to change her mind, and so Mr. Halliday ventures to suppose that Cleopatra bears Antony company as far as the coast in her State barge. He adds, with painful conscientiousness, “It is not unreasonable to suppose that the gorgeous ship in which she first set out to meet Antony in Cilicia was still in existence and in use at this period.” It is a pity that he did not allow himself to suppose further that the ship had been re-gilded and re-decorated, and the pages and ladies-in-waiting supplied with new liveries on this occasion. The painter, however, has assumed the necessary license, and has made both ship and crew as smart as possible. A pretty picture is introduced for the gratification of spectators, and this might have been done without a contrivance which is manifestly awkward. It is surely artificial to make Cleopatra employ at the moment when she is temporarily losing Antony the same adornments which she used when first she won him. Neither Shakspeare nor Dryden would have made this mistake. Cleopatra is represented by the former as inconsolable at Antony's departure, and we may be sure that, if she had not felt absorbing grief, she would at least have assumed it. She was not like some modern widows, who are able at an early moment of their bereavement to consider the fashion of their mourning. We think further that it is only consistent with the riotous extravagance of the Egyptian Court to suppose that Cleopatra had had several new barges, with successive novelties in drapery and furniture, since she met Antony on the Cydnus. Mr. Halliday should allow himself to imitate contemporary novelists who revel in gorgeous upholstery and varied and splendid patterns of carriages.

It would have been easy and agreeable to all spectators to have introduced this picture as a substitute for the ordinary drop-scene of the theatre; and if the play-bill had contained a brief explanation of the picture, it would have furnished to the play an introduc-

tion which would have been more graceful and perhaps not less useful than a reprint of a preliminary puff from the *Daily Telegraph*. It is rather humiliating to observe that, when Dryden took this subject in hand, he formed a much higher estimate of the intellectual capacity of his audience than could be formed by Mr. Halliday. There is in Shakspeare's play a looseness of construction beyond his usual negligence; but when Dryden, to use his own expression, essayed to bend the master's bow, he put forth all his strength and skill. If the manager of Drury Lane Theatre were forced to dispense with accessories, and depend upon a play alone to fill his house, we incline to think that Dryden would serve his purpose better than Shakspeare. There are, of course, passages in which Antony maintains the character given to him in the prologue, and these passages would need to be omitted. But probably the scene in which Ventidius and Cleopatra contend for influence with Antony—one calling him to duty, and the other enticing him to love—would impress an ordinary audience more strongly than any scene of equal length in Shakspeare's play. Dryden took care to write what everybody could understand, and avoided those conceits which are intermingled with many of Shakspeare's finest passages. After a long contest, love triumphs over “fortune, honour, fame,” and Antony exclaims:—

Give, you Gods,

Give to your boy, your Cæsar,
This rattle of a globe to play withal,
This gowgaw world, and put him cheaply off.
I'll not be pleased with less than Cleopatra.

Ventidius confesses his defeat in the words:—

Oh women! women! women! all the Gods
Have not such power of doing good to man
As you of doing harm.

The scolding-match between Cleopatra and Octavia has been condemned by fastidious critics; but we have little doubt that it “brought down the house.” Octavia taunts her rival with the name of Cæsar, and she answers:—

The worst your malice can
Is but to say the greatest of mankind
Has been my slave. The next, but far above him
In my esteem, is he whom law calls yours,
But whom his love made mine.

Nobody now reads Dryden; and probably there are many persons in the theatre every night who have not read Shakspeare. But everybody reads, or is supposed to read, Tennyson; and probably the picture of Cleopatra most familiar in our day is that which he has drawn. It is a picture that might well inspire the most gifted and practised actress with despair. Where shall we find the warbling voice, “a lyre of widest range,” and the eyes whose fires tip the keenest darts of love? It is no reproach to a young and promising artist that she falls short of impossible perfection.

We must notice more briefly than it deserves the success of a new play called *Chivalry* at the Globe Theatre. The management of this house by Mr. Montague has been always laudable and generally judicious. If he has sometimes made mistakes, he has always honestly striven to attain excellence. We are not sure that this new play will be popular, but we are sure that it deserves to be so. The author had given in an earlier play promise which he has now largely fulfilled. He has done well, and he may do still better. The palm of acting must be assigned to Mr. S. Emery, whose performance of a slightly puritanical but chivalrous Western squire under James II. was admirable. The rebellion of Monmouth must be a very attractive theme, as we have had two plays on the subject within a year or two. Colonel Kirke, who of course appears in both plays, was better treated in *Anne Clarke* at the Queen's Theatre than he is at the Globe, where author and actor have conspired to make him a low pothouse ruffian. It is probable that the colonel of the Queen's Regiment united profligacy and cruelty to the look and manners of a gentleman. Macaulay, who, sometimes careless in minor facts, was pretty accurate in general conception of character, does not say that Kirke was vulgar.

REVIEWS.

GODKIN'S RELIGIOUS HISTORY OF IRELAND.*

WE have gone through Mr. Godkin's book with somewhat of an effort, and we have learned more from the latter part than from the beginning. Mr. Godkin is clearly more at home with Dr. Cooke, Bishop Doyle, and Archbishop Trench of Tuam than he is with St. Patrick and St. Kevin. The book is disfigured throughout by the practice of filling the pages with scraps from other writers; but in the early part there is very little but scraps, and very often such scraps. To be sure a scrap from Dr. Todd or Dr. Petrie is not to be despised, wherever we may meet with it; but we had rather read them in their own books than in scraps cut out by Mr. Godkin. But all Mr. Godkin's scraps are not scraps from Dr. Todd or Dr. Petrie; alongside of these tit-bits we find morsels of Mr. Marcus Keane. It is even so; our amazement at meeting a live Semi-Saxon, even our amazement at meeting a man who believes in Brutus, sinks to the level of common-place at finding that there is another man besides Mr. Keane who believes

* *The Religious History of Ireland, Primitive, Papal, and Protestant; including the Evangelical Missions, Catholic Agitations, and Church Progress of the last Half-Century.* By James Godkin. London: H. S. Klag & Co. 1872.

in the Outhites. Mr. Godkin gives his extracts in the most solemn tone, and it is plain that he believes that the round towers and most of the Romanesque buildings of Ireland were the work of Outhites. Now the Outhites are—it might sound more scientific, and might also be more grammatical, if we said that Outhism is—something like Freemasonry; we know all about it, except what it is; we are told a great many things that the Outhites did, but nobody tells us who the Outhites were or why they were called Outhites. If neither Mr. Keane nor Mr. Godkin will tell us this, we shall be driven to guess that Outhism was a “deposit of Sinism,” or that its peculiar creed was a “polarization of religious consciousness.” Brutus at Totnes is clear and credible compared with the Outhites; for Trojans have at least a legendary being; the name gives us an idea; but of Outhites we can find out nothing, except that Mr. Keane and Mr. Godkin say that they built the round towers in honour of Baal or Buddha—we are not, and perhaps they are not, very particular which. But Mr. Keane and the Outhites and the learned Bryant are not all; Mr. Godkin quotes the *Two Babylons* with much respect, and gives us in a note a little life of its author, who, it seems, was a learned Scotch clergyman. We trust that none of our readers have forgotten the *Two Babylons*; if any are so unlucky, we will remind them that the book was written to prove that the worship of the Roman Catholic Church is really the worship of Nimrod and his wife, and that this doctrine is proved by a good deal of etymology of that style in which the ending of a Greek noun goes for quite as much as its root. We need not dwell longer on this kind of stuff, except to wonder that a man like Mr. Godkin, who knows how to write sense upon some subjects, should ever have given it a moment's serious thought. And, as we remarked long ago in reviewing Mr. Keane, this kind of thing is a proper punishment on those who dream that neither in Ireland nor anywhere else could any one put stones together till the eleventh or twelfth century. The process is ingenious. Dr. Petrie has proved that the ancient buildings of Ireland were not the work of the Normans. Mr. Parker has proved that nobody could build anything in the time of the Celts. Nobody has ever thought that they can be later than the Normans. Therefore they are earlier than the Celts. Therefore they are the work of Outhites, Baal-temples, phallic emblems, anything anybody pleases. Q. F. D.

Of the history of Ireland from Henry the Second to William the Third we are really getting weary. It is in fact becoming little more than an occasion for reviling everybody all round, both those who did the deeds in times past and those who write about them now. Mr. Froude has so managed as to have his fling at every race and every religion—we beg pardon, we ought perhaps to except the Outhites and the worshippers of Baal—that ever found a settlement in the unhappy island. And in return all races and religions—the Outhites perhaps having no representative left—seem determined to have their fling back at him. Mr. Godkin, early in his book, professes a certain degree of contempt for the Celts, but he gradually becomes their champion against Mr. Froude. Here and there he makes good hits, as when he comes to Cromwell's massacres at Drogheda and Wexford. There he comments, fairly enough, “If Cromwell were an Irishman—one of the O'Neills and O'Briens—what a thrilling narrative Mr. Froude would have given us of those two days' slaughter in cold blood!” He asks too why “Mr. Froude was silent about the siege of Clonmel, where, according to Whitelocke, ‘they found the stoutest enemy this army had ever met in Ireland,’ and where the Irish garrison after a stubborn resistance at last surrendered on honourable terms. And Mr. Godkin makes a perfectly fair point in the following paragraph:—

Mr. Froude frequently misleads his readers, quite unintentionally of course, by the fallacy of using the word “Ireland” in several different senses, perhaps in the same paragraph. Sometimes it means the land, sometimes the Irish nation, and sometimes the Anglo-Irish colony. The oddest misapplication of the word is where, after the chiefs, landed proprietors, bishops and priests, had been all got rid of, he speaks of the miserable remnant of the people as being so terrorised and debased, that to save themselves the more desperate of them brought in to their rulers the heads of their fathers, uncles, brothers, and cousins in sacks, claiming the Government reward for having cut them off, as if they were wolves. The rulers asked no questions for conscience' sake. On this Mr. Froude remarks:—“It was a hateful method, but under the circumstances inevitable.” And in doing work like this, in order to clear the country effectually of its inhabitants, he says, Cromwell “meant to rule Ireland for Ireland's good, and Ireland never prospered as she prospered in the years of the Protectorate.” What was she?

And again, when Mr. Godkin comes to Mr. Froude's famous chapter about Irish ideas, after mentioning some of the worst cases of English treatment of Irishmen, he goes on with a queer but vigorous comparison:—

Here are “English ideas” with a vengeance, delivered by a judge. Of course the Irish must have been very stupid not to have received them with gratitude! And this reminds me of a fallacy which pervades the historian's treatment of the Irish. He suggests comparisons with England, not as it existed then, but as it exists now. It would be quite easy, from the best English writers of the eighteenth century, to fill volumes with records of barbarism to match the worst things he has brought against the unfortunate race on whose character he has fastened, like a woman who clothes her gawp-daughter in rags, starves her almost to death, beats her black and blue, drives her into melancholy, and then calls her neighbours to behold the contrast between this persecuted child and her own well-clad, well-fed, highly-cultured pet daughter, declaring that the other is a graceless reprobate, that she can get no good out of her, and that it is all in the incurable depravity of her nature.

But we will turn from these endless disputes to that part of Mr. Godkin's book which has most interested us—namely, where

he deals with later times, and gives us pictures of the three great religious bodies in Ireland, of the religious decline and the religious revival which has happened in all three alike. This is both fresher and pleasanter work than fighting the old endless battle over again, and Mr. Godkin treats the three rival communions with praiseworthy impartiality, and is ready to do justice to good and zealous men in all three alike. There is something which at first sight seems strange in the sight of three rival religious communities all falling into a lethargy, as it were side by side. As a rule, Dissent does good to an Established Church, and an Established Church does good to Dissent; because neither can for shame go to sleep in the face of the other. In a great part of the last century indeed both Dissent and the Established Church may be said to have gone to sleep. But that was because Dissent had ceased to be Dissent. When persecution was over, the old Nonconformity ceased to be aggressive, and, ceasing to be aggressive, it ceased to be vigorous. A new schism within the Established Church stirred up the slumbering energies of Churchmen and Nonconformists alike. But in Ireland none of the three religious bodies could be with any fairness spoken of as Dissenters or Nonconformists. There were three nations in the island, and each of the three had kept or had brought with it its own national Church; and, as one of the three nations was politically dominant, the Church of that nation was politically dominant also. In England the Nonconformists had, as a matter of fact, separated from the Established Church. In Ireland none of the three religious bodies could be said with any fairness to have separated from any of the others. The Established Church in Ireland, though endowed with possessions and privileges above the other two, could not have the face to profess, as the Established Church in England fairly might, that she had ever been the Church of the whole people of Ireland, from which other religions had parted off. Neither the Roman Catholics nor the Presbyterians could be called separatists from the Protestant Episcopal Church; and, as toleration advanced, both Roman Catholics and Presbyterians, though not in the technical sense established, yet received an amount of State recognition and State endowment which put them in quite a different position from the Nonconformist bodies in England. They may be looked on as three Churches side by side, one of which had an invidious temporal superiority over the others, but none of which sought to do much in the way of proselytism from the other two. In such a case, in an age when all religious bodies had a tendency to go to sleep, all three might very well go to sleep together. It is when religious bodies are aggressive and proselytizing that the presence of rivals becomes a motive with each to put on its best face. The slumber of the Established Episcopal Church in Ireland, its nepotism, its pluralism, the utter neglect of duty on the part of many of its visitors, have often been described. The Irish Church in the days of its slumber showed in a greatly exaggerated form all the evils which were at the same time to be seen in the English Church; both have had their revival; only in England there has been the twofold revival—first, the Evangelical and then the High Church revival, while the effect of the latter of the two has in Ireland been very slight. Now what has most struck us in Mr. Godkin's book is the way in which he points out how the other two religious bodies also fell asleep and also awoke. He gives us a description of the Roman Catholic clergy in the last century which quite equals any picture of the same kind which could be drawn of their Protestant rivals. A bishop like Dr. Doyle found as much to reform in the way of carelessness, slovenliness, and general neglect of duty as any reforming Anglican bishop could do. And Mr. Godkin brings out more clearly than we are used to see it put the distinction between two very different classes among the Irish Roman Catholics. Not only Bishop Doyle but, what we should less have expected, Archbishop MacHale, the famous Lion of St. Jarlath, appears in his pages as the representative of what we may call a national Irish Catholicism, answering, though of course with a much less marked character, to the Gallican school in France and to those old-fashioned steady-going Roman Catholics of England who did not forget that they were Englishmen. The newer and now prevalent school, the party of mere Ultramontanians, finds its representative in Cardinal Cullen. Within the Established Church, Mr. Godkin gives us a full and interesting picture of the life of Archbishop Trench, the last Protestant Archbishop of Tuam, and a shorter notice of the late Primate Beresford, “one of the most exemplary, pious, and princely of all the prelates that ever adorned the Irish Church.” In no ecclesiastical body—not in Scotland just before the Reformation, not in Germany when the Bishops and Abbots were Electors and princes—were the high places of the Church more shamelessly made the special possession of a few great families than they were in the Established Church of Ireland in its slumberous days. But on the other hand the accident of being called Trench or Beresford, if it was no qualification for ecclesiastical office, was certainly proved to be no disqualification. Primate Beresford's name is still fresh in many people's memories. The remembrance of Archbishop Trench is doubtless fainter, but Mr. Godkin's sketch of his life brings him out as a man well worthy to be remembered.

Among Presbyterian worthies we are less likely to be at home than among either of the two other classes. Yet the account of Dr. Cooke, with the two curious and almost opposite sides of his character, is well worth looking at. He appears on the one hand as the reviver of the theological orthodoxy in the Presbyterian body, and on the other hand as one who, as far as in him lay—and that was to a very considerable extent—committed the influence of that body to the cause of Irish Toryism, and even

to the maintenance of the Episcopal establishment. It certainly was a strange state of things when, out of the large and flourishing Presbyterian body in the North of Ireland, not a single Presbyterian could find his way into Parliament, and when the most eminent divine of the Presbyterian Church seems rather to have approved of such a state of things. Dr. Cooke found the religious body to which he belonged by inheritance fallen away into heterodoxy of some kind which Mr. Godkin and his authorities seem to call indifferently Arian and Unitarian, though, in the sense which the last word commonly bears, the two forms of heresy seem to us a good way apart. The whole sketch of Dr. Cooke, his challenge to and triumph over O'Connell, the life which he stirred up in his own religious body, and his last effort, so strange as it seems to us in one of his persuasion, a great speech and a dying letter against disestablishment, joined to form a curious, though at first sight contradictory, picture of what must have been a really remarkable man.

Mr. Godkin's last chapter deals with the state of things since the disestablishment, with the constitutional settlement of the disestablished Church, and with the movements for making changes in its offices, if not in its doctrine. Mr. Godkin's own notions do not come out very clearly, or rather at first sight they seem a little contradictory. He says, as if in a deprecating tone, that "the greatest dangers to the Church will arise from the popular demand for a revision of the Prayer-Book in a decidedly Protestant or Evangelical sense." Yet he had a little way before said somewhat triumphantly:—

Now, the laity have a potential voice in the patronage of the Church, and it is calculated that in the course of ten or fifteen years all the sees and parishes will be occupied by Evangelical men, who can be ruled upon to carry on the war against the Church of Rome, instead of labouring insidiously to bring the Protestants of Ireland under the sacerdotal yoke which most of them detest.

Mr. Godkin is full of admiration for two of Mr. Gladstone's Irish measures—for the Disestablishment Act and for the Land Act. About education he says:—

But the third limb of the upas, the Educational grievance, though originally the worst part of the penal code, was greatly exaggerated in Mr. Gladstone's imagination. It had been from time to time almost entirely cut away, and the remnant of the poisonous trunk might have been quietly removed, by carrying out a little further principles already in operation.

He is strong on behalf of the National system and the Queen's Colleges, and he ends with an almost enthusiastic tribute to the services done to Ireland by the elder University of Dublin. "Of all the institutions planted by the English in Ireland, the University is the most successful. It is the only one of which all parties are proud." Mr. Godkin is much better employed in speaking of these later matters, which he has clearly looked at with much care, and we think with much impartiality, than in puzzling his brain about Outhites and Fir-Bolgs.

BLACKWALL'S RESEARCHES IN ZOOLOGY.*

A VETERAN in Natural History, Mr. John Blackwall has had the satisfaction of seeing through the press a second edition of his *Researches in Zoology*, in which he has been able to incorporate such additions and emendations as the interval of forty years has enabled either himself or others to effect. Not a few original discoveries or observations of his own have long ago taken their place among the established and fundamental principles of zoology; and if in not a few instances the advance of scientific knowledge in that department of nature has left parts of his original work out of date, it must be allowed that not a little of this forward movement has been due to the impulse given in the first instance by suggestions of his own. It is hardly to be wondered at, or to be complained of, that he represents in the main a stage in scientific attainment now a full generation old. Trained in the school of Cuvier and the elder Darwin, and contemporary with Kirby and Spence, he will be found to have made not many steps in advance of the *Règne animal* and the *Zoonomia*. His ideas of causation, of animal organization and development, seem not much influenced by anything that has been done in our day by Charles Darwin, Wallace, or even Owen, towards penetrating deeper into the ultimate laws or facts of animal life. His powers as a naturalist, and the value of his services to science, turn far more upon the closeness of his observation and the keenness of his judgment than upon any depth or breadth of reasoning, or any aptitude for philosophical thought. He has never wearied of collecting facts, and has spared no pains to record them correctly. Without aiming to elaborate a system of his own, or even to resolve what he has amassed into an organized body of speculative opinion, he is content with such explanations as common sense or analogy not too far-fetched may bring to the solution of difficulties. Whilst anything but a theorist in the general sense of the word, he can yet be often happy in the particular theory by which he clears up what is puzzling or seemingly anomalous in nature.

That a certain old-world character pervades Mr. Blackwall's ornithological papers will be seen from his gravely drawing out the proofs that swallows and others of our migratory birds do not pass the winter in a torpid state at the bottom of pools, in marshes, or similar places of concealment. Encouraged as it is by the high authority of Cuvier in the case of the sand-martin (*Hirundo riparia*), and, as Mr. Blackwall adds from

memory, of Humboldt, we should have thought this table hardly worth the trouble of refutation even at the date of the original "Researches." In the process of laying this ornithological phantom our author puts together nevertheless a number of minute and curious facts which even now possess an interest, both as natural evidence of the habits of birds, and as the result of experiments carried on artificially. These observations, combined with those of the phenomena of hibernation in the case of the dormouse, hedgehog, bat, and common insects, completely satisfied his mind as to the absence of any physiological tendency whatever in birds to become torpid. Considerable uncertainty, it is true, still prevails as to the actual places of resort to which our migratory species betake themselves on the approach of winter. It was held by Adanson that European swallows retreat as far as Senegal, and later observers have traced them to Northern Africa, Egypt, and Western Asia. Our author's observations are extended to prove that the periodical winter birds, such as the woodcock, the jack-snipe, the mountain-finch, and the redwing and fieldfare, which are seen here in numerous flocks during winter, have their breeding-places in Northern Europe—in Sweden, for instance, as held by Linnaeus, or in the Tyrol and Alpine regions. He is also led by his own studies to confirm the opinion of Temminck, that most periodical birds perform their migrations by night. His own field of observation being the neighbourhood of Manchester, the dates and other characteristics of bird life and habits vary in his case from those compiled by more southerly observers. His four tables, ranging over fifteen years, give the average days of disappearance and return of—I. Periodical summer birds; II. Periodical winter birds; III. Birds which are irregular in the times of their appearance and disappearance; and, IV. birds which are partially periodical; together with the temperature of the air at each date. It is worth notice that the temperature is considerably higher when the migratory summer birds withdraw than when they reappear. This is uniformly so, and to a remarkable degree with the cuckoo and the swift. That several species of these birds moult during the period of their absence is a fact not sufficiently observed or weighed by naturalists as an evidence of migration; nor has it been generally known that the sexes do not, as a rule, travel in society, the male birds in several migratory species usually preceding the females in their spring flight.

The notes of our singing birds have been observed and analysed by Mr. Blackwall with a degree of care which enables him to correct and supplement in many particulars the comparative catalogue of Daines Barrington. His table of some six-and-thirty songsters assigns to each its vocal rank under the heads of mellowness, sprightliness, plaintiveness, compass, and execution. Fixing the point of absolute perfection at twenty, we are not surprised to find the nightingale credited with nineteen points under the first and last three categories, falling in sprightliness to fourteen, in which quality the whole race of songsters, barring of course the skylark, is distanced by the wren with her nineteen points, in other respects scarcely being placed. The chaffinch, which Mr. Barrington's definition of a song-bird ought by rights to have excluded, and the sedge-warbler (*Sylvia phragmitis*) come next as sprightly songsters; while the redbreast, only attaining eight points in that capacity, rises to sixteen in compass and seventeen in execution, second in this respect to the "most musical, most melancholy" among birds. That the singing of birds has its origin in the feeling of love is by no means so strongly believed in by our author as by the more recent or advanced school of ornithologists. His views upon this point are indeed largely mixed up with his impressions upon the nature of instinct in general, in which respect he seems wholly unconscious of the progress achieved of late years in the study of the fundamental laws of consciousness as running through the whole animal kingdom.

The habits and peculiar characteristics of the cuckoo have been through life a matter of intimate study with Mr. Blackwall, and no one has done more to clear up what was most obscure in the ways of that puzzling bird. That the cuckoo should have been held to build and even incubate, incontrovertible as it appeared to Dr. Darwin, Daines Barrington, Mr. Fleming, and other good observers, will probably now be thought strange. Such cases as served to convince the older class of ornithologists were, as our author shows, the result of mistaking nests and eggs of the goatsucker for those of the cuckoo. The peculiar parasitic habits of this exceptional bird in quartering its offspring upon others for shelter and food are characteristics by which it is no less known than by the special distinctions of its organism or its peculiar note. That the unfledged nestling should be able to attract to itself not only the undivided care and attention of its foster-parents, whose young it has violently ejected from the nest and caused to perish, but that of other birds, by scores at a time, is one of the most striking things in natural history. It is hard to assign any more immediate cause of it than the importunate cries of the orphan brood, which is all that our author has to suggest. The problem, however, connects itself at once with the whole theory of the nature of instinct. The notion that the songs or cries of animals are to be traced to the direct tuition of parents is of course disposed of most summarily in the case of the cuckoo by the fact that the offspring grow up and utter their notes without hearing their own parent's voice, nor yet do they acquire that of their foster-parents. From observations such as this, fortified by well-known and innumerable examples of birds building their nests, and the like, in the absence of any immediate means of being taught, Mr. Blackwall satisfies himself that nothing can be done but to fall back upon the old notion of instinct

* *Researches in Zoology: Illustrations of the Structure, Habits, and Economy of Animals.* By John Blackwall, F.L.S. Second Edition. London: Van Voorst. 1873.

as a mysterious power in a special manner implanted by the "all-wise Author of nature," a "first principle of causation" reducible to no known laws, and supposed somehow to supply a stronger proof of power, wisdom, and goodness than such phenomena as have been reduced to law, and been shown to follow strict and unvarying sequence. Unconscious, it would seem, of all that has been done by Darwin, Wallace, Herbert Spencer, and others for the elucidation of what is called instinct as the result of accumulated and transmitted experience, he is separated from the whole existing group of naturalists by a gulf across which it is beyond the functions of criticism to follow him. We may thank him for what he has observed or brought together of the strange propensities or habits of the cuckoo, without submitting to his axiom "that the peculiarities of this extraordinary bird having been acquired is a notion to be relinquished as absolutely untenable."

The simple test of experiments with the air-pump, showing flies and other insects to retain wholly unimpaired *in vacuo* the power of walking upon vertical or inverted surfaces, even when highly polished, convinced Mr. Blackwall long ago that the common opinion was untenable which ascribed this power to the action of exhaustive suckers under the insect's feet. Added to this proof was that from the anatomical structure of the organs as shown in the microscope. Not only could no trace be found of suckers of this kind, but the presence of bristles or hair-like papillæ thickly covering the expanded membranes in which the tarsal joints or under surface of the limb terminated rendered the formation of a vacuum inconceivable. It is to be doubted, however, whether the hypothesis which Mr. Blackwall has to substitute for this ordinary view rests on any better foundation. These papillæ or filaments, he considers, are hollow, and exude a highly adhesive mucous secretion by means of which the fly nukes good his foothold of the wall or ceiling. It is in favour of this view, he urges, that when these surfaces are breathed upon till the aqueous vapour is copiously condensed upon them, the fly drops at once from its hold. The same result follows if a little oil, flour, or powdered chalk or gypsum be spread upon the glass or other surface, the minute particles of these substances adhering to the tarsal brushes of the fly or spider, or to the under surface of the feet of the larvæ. What our author has neglected to take into account is the difficulty of detaching the feet at each step when thus glued or stuck fast, especially considering the twinkling rapidity with which the fly takes its run along the pane, the wall, or the ceiling. That flies do stick to the glass of windows and other surfaces towards the end of summer and autumn is a fact which has been explained by the growth from the interior of the body of a parasitic fungus (*Sporendonema muscæ*, Fries; *Empusa muscæ*, Cohn). But then the locomotive powers of the insect fail. Is it not better to conceive a power of lateral gripe or clip in the brushes or filaments terminating the foot, which, availing itself of the slight asperities of surface which must be found in a degree in all but the most bright and polished objects, suffices to support the light body of the insect? When the surface is intensely clean and polished, no insect, Mr. Blackwall found, could ascend or cling. When softened or moistened by the breath, or clogged by oily or viscous matter, such minute roughnesses as we have spoken of would no longer afford a hold for the insertion or grip of the hairy brush. It may be, however, that there are at work in the action of these delicate organisms forces or laws as yet undreamt of in our philosophy of insect life.

The natural history of spiders, especially of our domestic species, is a study which Mr. Blackwall has in an especial manner made his own. The part of the first edition of his "Researches" since issued by the Ray Society as *A History of the Spiders of Great Britain and Ireland* has not been included in the present reprint. Several papers of great value and interest have notwithstanding been retained and supplemented by the author's later observations. Sundry of the most prominent points in the anatomy and microscopic structure of spiders are illustrated in a couple of plates; the former showing the structure of the tarsus and metatarsus, with their articulation and spinous appendages, in *Ciniflo atrox*, *Epeira diadema*, *Salicis scenicus*, and other species; the latter plate giving a highly magnified view of the spinners in the species first named, distinguishing more particularly the fourth or inferior pair, from which the material is given forth which is formed by the calamistræ into the pale-blue bands in the snare of this species. The reproduction of these important organs, together with the palpi after moulting, first observed by Mr. Blackwall, had escaped the notice of Dr. Heineken, to whom was due the knowledge of the renovation of the limbs and integuments. Another problem of great interest is that of the true nature and functions of the remarkable organs connected with the digital or terminal joint of the palpi of male spiders. Our author's researches satisfy him of the correctness of the views of Dr. Lister and the earlier systematic writers on arachnology—that these parts are strictly sexual, and not merely employed, as was thought by Treviranus and Savigny, for the purpose of pre-excitation. He has accumulated some curious observations upon the anomalous conformation and number of the eyes in various species or individuals, which point to many matters for careful study on the part of entomologists. Whether there are species normally provided with an odd number of eyes is a question in point, and is left indeterminate by the casual absence of a supernumerary eye, situated between the two small ones constituting the anterior intermediate pair, in an adult female *Theridion filipes*, the total number possessed by this individual being nine, the left intermediate eye of the posterior row being absent in an adult female *Epeira molinata*, the right

intermediate eye wanting in an adult male *Lycosa cambrion*, and the left of the posterior row in an adult female *Ciniflo atrox*. The poison of spiders, their nets, and the parasites that haunt them, furnish much matter for careful and original observation. But no part of the work can be said to surpass in interest Mr. Blackwall's discussion of the mode whereby aeronautic spiders effect their aerial excursions. Not merely some occult physical power inherent in the insect, but the agency of winds, evaporation, and electricity has been called in to explain the phenomenon which is to be seen on many a calm and sunny day about the present season of the year. Not only do spiders innumerable cover hedges, grass, stubble, posts, and other objects with their delicate gossamer, but they are seen in thousands mounting into the air by means of those fine threads of tissue which show no point of attachment to any object overhead. Whether the motive for this instinctive ascent be or be not, as Mr. Blackwall thinks, the anxiety of these creatures to shift their quarters—the proximity of such prodigious numbers causing a feeling of insecurity, involving, as Mr. Darwin puts it, a struggle for life—his observations seem to have placed the mode of action itself beyond doubt. The viscid substance emitted from the spinners is drawn out by the upward currents of air engendered by rarefaction into lines hundreds of feet in length, and often matted together in the upper air. Sufficient hold of the atmosphere is thus afforded to buoy the insect up aloft, if not to hoist itself upwards by means of the retractile power it may command over its web. How much may be effected by this facility of sailing in the air towards the geographical distribution of spiders of this class is one of the many fertile themes for thought and observation thrown out in the course of Mr. Blackwall's pages.

THE ATLANTIC TO THE PACIFIC.*

THIS is a little book which has a certain interest from its subject, though it has no pretensions to literary excellence. In character it is half-way between a guide-book and a book of travels properly so called. The author does not make the smallest attempt at fine writing. He shows equal modesty and discretion in declining to paint in words the wonders of the Yosemite Valley, and dwells at much greater length upon the admirably contrived stables of Mr. Milton S. Latham. It is not that Mr. Lester possesses a mind more sensible to the charms of horseflesh than of scenery. His very silence impresses us with the belief that he really enjoyed the sight of waterfalls and cliffs; but he evidently feels that it is easier to find adequate language for the description of stables inlaid with polished wood and resembling a drawing-room rather than a provision for the comfort of ordinary horses. If we feel a certain negative gratitude to Mr. Lester for resisting the ordinary temptation to fine writing, we are almost equally grateful to him for not indulging in small facetiousness. American humour is at times really amusing; but the inferior article supplied under that name is apt to have a depressing effect upon the spirits. That Mr. Lester would hardly be qualified to succeed in the vein of Bret Harte or of Mark Twain may be inferred from the two or three instances in which he condescends to be funny. There is a simplicity about his notion of a joke which is almost touching. He records, for example, the smart saying of a passenger on the Pacific Railway, whose wife had provided a luncheon-basket in which were a devilled chicken and other similar delicacies. Tired with carrying it about, this wag at length exclaimed, "Wife, I wish all these devilled things were at 'the devil'!" We presume that a long railway journey becomes after a time so depressing that the passengers are amused by jokes which would hardly pass muster in the Tichborne trial. We cannot think of a stronger comparison to express utter inanity. We may set by the side of this gem a brilliant remark of the lady who writes under the name of Grace Greenwood. The Californian mountains, it seems, have a great abundance of brightly coloured flowers, many of which are yellow. When this phenomenon was brought under her notice, Grace Greenwood "prettily said" that it was to let us know that there was yellow gold under them. We have the misfortune not to be acquainted with this lady's writings; but we venture to hope that this is not a fair specimen of her talent. Perhaps it is rather a proof that when literary lions, even of a moderate variety, are travelling in a remote country, they must expect to have their smallest sayings diligently collected and repeated for the benefit of an admiring world.

However, it is time to say that the book has its merits. Mr. Lester very rarely indulges in those little outbursts of wit and humour; and, on the other hand, he gives us a plain, sensible, and straightforward account of the best method of reaching the wonders of California. The railway across the Continent has already brought the country within easy reach of the Eastern States, and even a traveller from England might get there without much trouble in three weeks. Mr. Lester is anxious that the trip should become popular. The expense of a tour from Boston and back, including visits to various parts in Nevada, Colorado, and Utah, is put by him at about one thousand two hundred dollars. Adding the expense of two transits of the Atlantic, we may suppose that an Englishman could visit California for some three hundred pounds. The expense is enough to deter the great bulk of tourists, but it is certainly not extravagant, considering the distance to be traversed. Mr. Lester points out that the trip has for Americans and Englishmen the great advantage of requiring

* *The Atlantic to the Pacific*. By John Erastus Lester. London: Longmans & Co. 1873.

no knowledge of language; and he thinks that Americans at least would be "far better pleased and much more instructed" by visiting their own country than by going abroad. It is not for us to say what would most please them. As for instruction, we admit that the ordinary American tourist who comes to Europe with a total incapacity for putting together even two words of French probably receives as little intellectual improvement as if he had stayed at home. Perhaps, indeed, it is as well that Americans should sometimes prefer a trip which teaches them that other countries are tolerable to a trip which chiefly impresses them with the extraordinary size of their own country, an impression which is not unfrequently superfluous.

It is impossible, however, to lay down any general rule in such matters. Some people travel for repose, and others because they enjoy constant bustle and motion; some like art, and others prefer scenery; and each variety has something to say for itself. We have no doubt, however, that many tastes may be gratified by a visit to California. In many respects, as everybody knows, it is amongst the most characteristic and interesting of the States. The climate, the population, and the natural features of the scenery have all marked peculiarities which may attract an intelligent observer. The attraction, however, upon which Mr. Lester dwells at greatest length is the wonderful Yosemite Valley. It is creditable to the United States Government that this and two or three other districts have been set apart as public parks, and are thus to be preserved in their natural wildness for the benefit of future generations. The Yellowstone Valley, which is another of these parks, seems to be destined to outshine even the Yosemite. There is one water-fall three hundred and fifty feet high, and there are other rapids and cascades equal to those of Niagara. There is a lake twenty-five miles in length, at a height of over eight thousand feet above the sea, which is so warmed by the hot springs that it does not freeze in winter. Then there are innumerable geysers of all shapes and sizes which entirely eclipse our old friends in Iceland. At present, unfortunately, this "place of public resort and recreation," as it is called in the Act of Congress, is only accessible to people prepared to encounter the hardships of a rough frontier life. Doubtless it will be in time a superb place of recreation; and the descendants of the present generation of Americans may be thankful to their forefathers for having looked so far into the future for the security of the public interests. Mr. Lester did not visit this extraordinary region, but he gives us a full account of the most familiar wonders of the Yosemite. The name, we may observe in passing, is said to be properly *Yo-ham-e-ta*, which means "grizzly bear" in the language of the former inhabitants. We accept the etymology, though our faith in Mr. Lester's authority is slightly diminished when he tells us that the name of Calistoga is obviously derived from "*calis*, 'hot,' and *toga*, 'a garment,' on account of its sulphur springs. Why a place should be called hot garment—assuming that to have been the meaning of the gentleman who invented the name—because it possessed sulphur springs we do not precisely see. To return, however, to the Yosemite, it is news to us to find that it was discovered by white men in the course of some Indian warfare so early as 1850. Excursions began in 1856, and there are now several hotels, on the merits of which Mr. Lester discourses as naturally as though the country had been settled in the days of Columbus. Most of them, we are glad to say, appear to be tolerably good, and the difficulties of a visit, which are daily diminishing, are insufficient to repel any tolerably active lady or gentleman.

The wonders of this district, the big trees, the perpendicular cliffs, and the extraordinary falls have become notorious; the Alpine Club will be glad to hear that there is still a peak in this region which is pronounced to be "perfectly inaccessible to man," though we regret to add that it is little more than eight thousand feet above the sea; and, in short, the Yosemite Valley will soon be one of those wonders which no man has a right to die without having visited. One curious testimony to its merits is given by the history of Mr. J. O. Lanmont. He was engaged in mining in 1859, and, being drawn to the place by the wonderful accounts which he heard, found it so charming that he built a house there within the next year or two, and has never since quitted the place. For several years he passed the winter there in absolute solitude, and declared that the scenery was so grand and everchanging that he never found it dull. For two years he had the occasional company of another hermit, one James Wilmer, who had been driven from New York by domestic troubles, and found a tolerably secure refuge in the wilderness. Unluckily Wilmer was not even then beyond the reach of the post, and when letters came from his friends he would grow very low-spirited. Finally he seems to have drowned himself, a victim to family troubles or to the perfection of the American postal system. Still another inhabitant of a similar kind is John Muir, "the scholar and enthusiast." He, too, was so much struck with the grandeur of the place that he went home, closed his business, and returned to take up his permanent residence in the valley, where he has now "been reading the book of nature for three years." Mr. Muir is a geologist, and apparently maintains the doctrine, which has still rather a startling sound, that the tremendous gorge of the Yosemite was ploughed out by a glacier. Not to dwell upon this, however, it is certainly curious to find so strong a proof of the influence of this wonderful scenery.

We must confess that the accounts which we have generally read of this district have impressed us rather with a sense of

strangeness than of beauty. Perhaps this is simply the fault of the describers; and indeed we have remarked a similar peculiarity in the descriptions of Niagara. It is so much easier to say how many tons of water fall for how many feet than to describe a poetical impression, that the really exquisite beauty of the great waterfall is generally passed over to give a merely engineering account of its magnitude. Perhaps, on the same principle, the height and the strange formation of the Yosemite cliffs have blinded people to their true charm. Something, too, must be allowed for that uncomfortable sense of rawness which of necessity pervades even the wilder scenery of a new country. In the Alps we admire savage rock and ice; but then we are always conscious of human life in the background. Nobody can say how much the charm of Mont Blanc and the Jungfrau would be destroyed were it not for the chalets and the villages which cluster around their feet, and the network of paths which everywhere speak of human industry. The mountains are, so to speak, clothed with a web of associations which could not be stripped off without making their savagery too stern for æsthetic pleasure. Now in America the civilization which breaks the painful sense of solitude has not yet had time to harmonize itself with the scenery. It is plain from Mr. Lester's account that the hotels which receive travellers in the Yosemite Valley are merely repetitions on a small scale of the type of inn which prevails from New York to San Francisco. The true mountaineer does not exist; though a certain number of prosaic Yankees manage to force the mountains into their service. And all this leaves rather a blank impression upon the imagination, as though that quarter of the world were still imperfectly finished, and the mountains themselves more or less in the condition of Hundred-and-First Street in an American chessboard town. We should almost expect to find that lichens had not yet had time to grow upon the rocks, and, were it not for the giant trees, that the slopes of the hills were still unplanted. Of course this is more or less a fallacious view, and is perhaps connected with the fact that as yet California is more connected in our minds with florid oaths and strange miners' slang than with any indigenous literature. In the last respect it is beginning to show a few growths of some promise; and in time we feel that the country will be properly aired, and the mountain ranges fitted to cradle a poetical imagination. Meanwhile we receive much consolation from the cases of Messrs. Lamont and Muir. A Yankee hermit, and a hermit from a pure love of natural beauty, is rather a new idea to us; though Mr. Emerson's friend Thoreau may be said to be a case in point. But the valley which has exercised so magnetic an influence over these two enthusiasts must be a distinguished valley in its way; and we do not know that such a testimony to its merits is not even more conclusive than the death of a dozen tourists in the attempt to scale the inaccessible peak.

PILLARS OF THE HOUSE.*

SINCE the days when one man sat down to write the lives of the Seven Champions of Christendom, and to write them all in one book, we doubt whether there has been any writer whose daring equals that of the accomplished author of the *Heir of Redclyffe*. Nay, she is bolder even than that great ecclesiastical historian, who must be a man so much after her own heart; for he kept the life of each of his saintly heroes quite distinct, while she blends all her lives together. He moreover knew but of seven heroes, while she sings of a baker's dozen. We should find perhaps an apter comparison if we likened her rather to some great whip who, as he drove a long and restless team, could yet keep them all well in hand and each in his own place, or to an Esquimaux driving his pack of a dozen dogs, who, in spite of all their varied tricks, could yet keep them and their harness from getting into the least tangle. She does indeed now and then get a little confused with the numbers she has in hand, as, for instance, early in the first volume, when she says there "were perched numbers 4, 6, 7, and 8, to wit, Edgar, Clement, Fulbert, and Lancelot, all three (*sic*) handsome, blue-eyed, fair-faced lads"; and again, later on, where she says that "the five (*sic*) moved off—Polix and Alice, Angel in Wilmet's hand, and Lance's and Robina's tongues wagging so fast," &c. Can it be that she has fallen into somewhat the same confusion about the volumes of her novel as she has on these occasions about the number of the children, and that she fancies that she has written only three volumes and not four? She is aware that her reader, as well as herself, is likely to get puzzled with her thirteen heroes and heroines, and the corresponding heroines and heroes with whom they are bound to fall in love, and so she is considerate enough early in the story to give the following extract from the family Bible:—

Edward Fulbert Underwood married August 1st, 1837—Mary Wilmet Underwood.

Felix Chester	born July 3rd, 1838.
Wilmet Ursula	" Aug. 11th, 1839.
Aida Mary	" Oct. 6th, 1840.
Thomas Edgar	" Oct. 25th, 1841.
Geraldine	" Nov. 23rd, 1842.
Edward Clement	" Jan. 9th, 1844.
Fulbert James	" May 16, 1846.
Lancelot Oswald	" Feb. 20, 1848.
Robina Elizabeth	" Sept. 27th, 1851.
Angela Margaret	" Dec. 1st, 1852.
Bernard	" Jan. 6th, 1854.
Stella Eulora	"
Theodore Benjamin	"

* *The Pillars of the House; or, Under Woods, Under Rocks.* By Charlotte M. Yonge, Author of the "*Heir of Redclyffe*," &c. 4 vols. London: Macmillan & Co. 1873.

Our readers will observe with satisfaction that the twins are born so late that, though Stella Eudora might by this time have gone through a good deal of love-making and even got married, yet Master Theodora Benjamin, if he is still alive, may reasonably be expected to be still at college, trying rather to win a jumping-match than a lady's hand. We cannot speak with certainty, however, on these matters; for, to make a clean breast of it, we have never been able to get within even a long distance of the end of the work. Every one knows the old story of the child who by the use of some words of magic set the little porridge-pot boiling, but who could not stop it when it had boiled as much as she wanted. The porridge flowed on and on, filling first the room and then the house, till at last it spread out into the street, a stream *in omne volubilis ævum*, or at all events till it was choked by words as magical as those which gave it its start. Will Miss Yonge forgive us if we state that, as we met her staid and even flow of wholesome words, of which we could see no end, we began to think that we must have much the same feelings as those who had to meet the no less steady and even flow of porridge? We had this advantage over them, to be sure, that our reason taught us that our imagination was wrong when it pictured to us that of this flood there was no end. We knew that there were four volumes, and not five, and a 1220th but not a 1221st page. We knew that, though each page was closely printed, there were not so many as 47,000 lines in the whole book; and that, though each page was broad, our eye would fall short of travelling along three miles of type by some furlong or two. We knew that these four volumes did not contain more words than about one hundred Low Church, one hundred and fifty Broad Church, or two hundred High Church sermons; and yet we could not have anything more than a cold, unpractical faith that we should ever reach the last word of the last page. When we sat down before the four volumes we felt as bewildered as the countryman who in the squire's kitchen had the whole cheese set before him, and felt that he was in duty bound to get all through it. His appetite was good, and so we hope was ours, for the course of novel-reading which had of late been forced upon us was such as to render a change to simple and moral food a most agreeable one. But then a whole cheese for one countryman, and 1,220 pages for one reviewer! We remember in our college days how on a degree day, if a man was unpunctual and so left scant time for reading aloud the whole of the Thirty-nine Articles, our good-natured Dean would set him on to read the first at his utmost speed, then, just as his breath had failed, take up the second himself with all the vigour of a fresh pair of lungs. The two would thus get through the whole Thirty-nine with ease and comfort to themselves, as well as with great rapidity, just as two travellers got over a long road on what is called the ride-and-tie method. We should have done wisely if we had gone through the story before us on some such principle. We should have called in the aid of some brother reviewer, and, while one read, the other should have enjoyed that peaceful sleep which is so often the reward and the accompaniment of good reading. He who read should read holding the book in his hands, so that as he fell asleep the fall of the book might rouse up his friend from the long nap that he had enjoyed. It might, at first thought, seem that the same noise would awake both; but on experience it has been found that it takes a much louder noise to rouse a man at the beginning than towards the close of a sleep that is the result of virtue. We did not, however, think of this ingenious plan till it was too late to put it into execution, and what we have read we have read alone and unaided.

The Pillars of the House who give the title to Miss Yonge's story are some of the children with the strange names which are given in the first page of the family Bible. Whether by the end of the story all the children have grown up into being pillars, or whether some that were pillars have become but broken columns, we do not know. The two chief pillars of the first part of the work are Felix and Wilmet. Wilmet is an admirable girl, though whether more admirable than if she had been christened Mary or Jane or some other familiar name we do not know. (Charles Lamb, on the death of the last of his friends who knew him as a boy, sadly wrote, "There is no one left to call me Charlie now.") There will in another generation or two be no one left to be called Charlie; for no parent who has a proper regard to his children's interests will expose them to constant vexation, if not to ruin, by giving them those common names which have done so well up to the present day. By the early death of both their parents Felix and Wilmet have thrown upon them the care of Alda, Edgar, Geraldine, Clement, Fulbert, Lancelot, Robina, Angela, Bernard, Stella, and Theodore. It was a case surely in which the protection of the Court of Chancery should have been claimed. The children should have at once been made wards, and a decree should have been issued that Alda, Edgar, Clement, Fulbert, Robina, Angela, and Theodore should henceforth be known under their second names as Molly, Tom, Ned, Jim, Betty, Maggie, and Ben. Felix, Wilmet, Geraldine, Bernard, and Stella were beyond all help, as they either had no second names, or else the second names they had were as romantic as the first. They, however, might have been made to die that devotional death in which the author of the *Heir of Redclyffe* so much excels, at convenient intervals through the four volumes, while their commonplace brothers and sisters might have made or married fortunes. We must do Miss Yonge, however, the justice to admit that, so far as we have read—and we read for many long hours—all the children were alive, though two were in that delicate state of health which makes the reader almost as anxious as the doctor or the parent. Felix and Wilmet are at first aided in their care of the younger children by Mr.

Audley, a High Church curate. When we left him he was a missionary in the Southern Seas. If Miss Yonge has been able to resist the temptation of making a martyr of him, he has doubtless returned long ago, and married one of the baker's dozen. They have also a rich uncle with an only daughter. We have very soon a presentiment that Felix will inherit from him all the ancestral estates of the Underwoods, though how it is to be brought about we do not know, for they are entailed, and he is in love, but not with the heiress. She is far too strong and with far too much common sense to be killed off in a consumption, and she is not interesting enough to become a Sister of Mercy. She is, however, fond of riding, and so perhaps she breaks her neck. But of the plot, as we know next to nothing, so we must not venture to speak. When thirteen children have each to be described at length, and each moved up year by year, a plot does not advance very rapidly. Miss Yonge's paintings of child-life have certainly great merits, but to our mind as certainly great faults. If, as we fear is the case, children with such high-wrought feelings as she describes, really exist, she should hold them up as examples of a most mistaken and mischievous training. Mr. Caxton, in Lord Lytton's novel, sends his son to school to be made a fool of. Some of these saint-like children almost need to be sent somewhere to be made little sinners of. Not that Miss Yonge by any means paints thirteen saints; on the contrary, many of the children have faults enough; but about their penitence over their failings there is an exaggeration at times which we do not like. With the strange morbid restlessness which is so strong a mark of the present time, we would rather bring up children on the stories written in days when men were less self-conscious than on those which are now written for them.

We much regret, moreover, that Miss Yonge should bring so much of the slang of schoolboys into her books. In the systematic education of our children we leave English almost altogether to take care of itself; and, not content with thus neglecting it, in the story-books we place in their hands we too often do our best to teach them the silliest English possible. Miss Yonge's pages have a good deal of this schoolboy slang, and very dull it tends to make them. Our English writers would not do amiss if they were to take example from one of the South African tribes whom the missionaries have gone forth to convert. Livingstone in his *Travels* says of them, "Their language both rich and poor speak correctly; there is no vulgar style, but children have a patois of their own, using many words in their play which men would scorn to repeat." We have something to learn even from the unconverted and untutored mind of the savage. When Miss Yonge introduces into her book such expressions as "I'm glad you are going to get shut of me," or "Isn't it a horrid sell," or "They'll be as jolly dirty again directly," and the rest, does she not run some risk, through that strange association of ideas on which Mr. Shandy had so much to say, of making those admirable religious precepts which she constantly inculcates always raise up in the mind, when they are inculcated afresh, a notion of bad English? There would be this further advantage to her works in keeping slang out—that, unless something came in to fill up its place, they would be all the shorter. Nothing is wanted but a judicious Sanson among these "Pillars of the House" to make them most interesting. They would be greatly improved by a good deal of pulling down. We would undertake with no more literary appliances than a good stock of Indian-ink and a paint-brush to make Miss Yonge's story a very good book indeed. We would not put in a single word of our own, but we would daub out at least three-fourths of what she has written. We doubt, however, whether we would turn Herod and begin by a massacre of the babes; for after all Miss Yonge is true to nature when she makes a poor curate the father of thirteen. It would be sufficient to cut out such passages as the following, with all their potty details, which, with the equally petty talk, go so far to swell out this story to its vast size:—

Meantime Wilmet conducted the toilette of the two little children, and gave the assistance that Cherry needed, as well as discharging some of the lighter tasks of the housemaid; leaving the heavier ones to Sibby and Martha, a stout, willing, strong young woman, whom Sister Constance had happily found for them, and who was disqualified, by a loutish manner and horrible squint, from the places to which her capabilities might have raised her.

Then Wilmet helped her sister downstairs, and a visit was paid to the mother and the twins, who were Sibby's charge for the night. Mrs. Underwood was still in the same state. It was indeed possible to rouse her, but at the expense of much suffering and excitement; and in general, she was merely tender, placid, and content, mechanically busied about her babies, and responding to what was said, but entirely incapable of any exertion of body, and as inactive in mind as in limb. Wilmet attended to her while Sibby went to her breakfast, returning with that of her mistress in time to send Wilmet down to provide at the family meal, a genuine Irish dish of strab-out—for which all had inherited a taste from their father's Irish mother. Only Cherry was too delicate for such food, and was rather ashamed of her cup of tea and slice of bread.

Miss Yonge has done a great deal of good literary work. We are not sure, however, that she could find a better occupation for the rest of her life than to set about steadily compressing all that she has written. If it is too much to ask her to give up what is called original composition altogether, might she not devote each Lent to a ruthless cutting down of her old stories? The exercise, unlike many other exercises of mortification, would not only be beneficial to herself, but also to countless others. The paper manufacturers alone would have reason to complain, and possibly also the dealers in waste paper, for both would look upon such a penance as an act in restraint of trade. On the other hand, she would earn the gratitude of every one else, from the child whom she hopes to please to the critic whom she rarely fails to weary.

ARCHBISHOP TRENCH'S PLUTARCH.*

THERE is no depreciated ancient who more deserves rehabilitating than Plutarch; and there could scarcely be a modern scholar more fitted for the task than Archbishop Trench. Both are optimists in the tone of their writings. The characteristic of the old biographer and sage of Chæroneia was to "hope all things," and to see the good and noble amidst the congeries of mixed elements in a worn-out Paganism. The kindly student-prelate of our own age is too charitable to overlook in Plutarch the glimpses of truth which may have made him, in spite of himself, an unconscious pioneer of the Gospel; and he does full justice to a philosophy so right-aiming, and so far in advance of Pagan philosophies in general, that

Si Pergama dextrâ
Defendi possent, etiam hac defensa fuissent.

The Archbishop has also realized the fact that, though Plutarch's name is a household word with us as the model of biographers, inasmuch that (to give a single example) a collection of biographies of Welsh worthies is called the "Cambrian Plutarch"; though his *Parallel Lives* are called by Madame Roland "la pâture des grandes âmes," and Montaigne could say of them "It is our breviary"; though, too, his "Morals" have supplied hints for the Christian pulpit from the days of Basil the Great to those of Jeremy Taylor, still Plutarch has fallen from his pedestal in the present age. At the causes of this he does not hint, though they do not seem to us far to seek. The multiplication of books militates against the deliberate mastering of a voluminous author such as Plutarch; and those who supply the mince-meat pabulum which suffices for modern tastes easily find material of more manageable dimensions. The *Parallel Lives* are, indeed, if we except the Teubner text, to be found in their least bulky form in the four octavo volumes of Sintenis; and the reader of English translations has to choose between the tomes of the Langhorne and the racy old English folio of Sir Thomas North, which is itself a distillation of the French of Amyot. As good a taste of these *Lives* as can be got in a handy form is to be found in the little volumes which George Long translated for Charles Knight's series. The "Morals" are even of more cumbersome dimensions, Wytenbach's incomplete edition filling eight quarto or fifteen octavo volumes, and Didot's modern and comparatively handy edition two bulky crown octavos of the *Scriptorum Græcorum Bibliotheca* series. Separate treatises have been, no doubt, translated at various times; but it is obvious that the quantity of ground to be got over has stood in the way of modern familiarity with Plutarch's "Morals"; though, when books were less plentiful than at present, it is quite conceivable that Philemon Holland's folio translation was as delightful reading, or nearly so, as North's *Parallel Lives* which appeared a quarter of a century earlier. Under these circumstances it is perhaps hardly to be expected that students should have at their fingers' ends even the title of so vast an amount of matter, especially as there is no call for it in the University examinations; yet not the less would such an acquisition be of great value to the writer of biography or to the moral philosopher, for the hints it affords as to the kind of matter and manner likeliest to be popular in all time. We are not without a hope that Dr. Trench's delightful pilot volume, which seems as if it were an "Ancient Classic for English readers" that had slipt its moorings, will call back many whose Greek is not rusty to the Plutarch who is slumbering on their shelves, and many more who are more at home in the pure well of English undefiled to the choice volumes of North and Holland, wherein, as the Archbishop points out, there is both the intrinsic merit of good translation and the more extrinsic charm of curiosity of style and language.

The little that can be gleaned from Plutarch's gossiping references to himself and his surroundings in his "Symposiaca," or "Table-Talk," and elsewhere, has served the purpose of an autobiography without its tediousness, and this little has been gathered up and commented on by the Archbishop of Dublin. He sets down Plutarch's birth at about 50 A.D., and shows how a student life in his early years, under Ammonius at Athens, and two subsequent visits to Rome on political and philosophical errands, varied the monotony and enlarged the experience of a life begun in Chæroneia, a sleepy little Boeotian town in Plutarch's day, though once and again in former times "the dancing-plot of Mars." At Rome in Vespasian's day, and again in that of Domitian, Plutarch mixed with the most cultivated and literary Romans; and, under the last-named Emperor, whose malignant star does not seem to have fatally influenced either society or literature, he counted among his intimates Fundanus and Senecio, two of the correspondents of the younger Pliny. A curious fact brought out by the Archbishop is that, in spite of this intimacy—in spite, too, of a close connexion as a philosophical lecturer with the best Romans of the period—Plutarch never so much as alludes to any Roman poet, except once to Horace, and does not seem to have any further acquaintance with Cicero's philosophic writings, though these were in his line, than might have been got from Tiro's life of his master. The fact is, his Latin, acquired late in life, was of the scantiest, and there was the less need that it should be otherwise, because Greek, in which he revised and expanded his ethical treatises from notes of lectures, was a very much more familiar language to every educated Roman in his day than Latin is now to nine-tenths of the students at

an English University. In like manner Plutarch seems to have been utterly ignorant of the name of Christianity as a sect, though, as Dr. Trench says, it was "everywhere in the air," and he must have come across its churches in Greece, Macedonia, and Asia Minor, as well as at Rome. The supposed recognition of it in his "precepts on wedlock," where a wife is enjoined to honour her husband's gods, "shutting the door to all superfluous worships and foreign superstitions" (ἵναὶ δὲ δεισιμασιῶν), appears—especially when we remember St. Paul's use of *διδασκαλιστῆρος* to the Athenians—to apply to added heathen rites and worships rather than to Christianity, even though as seen by Pagan eyes. Probably he counted it, if he had any slight inkling of its existence, as only an unimportant phase of Judaism; and his incuriousness is of a piece, it seems to us, with his indifference to a mastery of Latin, and argues a steadfast concentration of his mind on his main life-purpose—the inculcation of high-toned yet practical ethics, and of a philosophy teaching by examples. Of the period which Plutarch and his fellow-workers redeemed from its darkness Dr. Trench eloquently writes:—

The ancient virtues were not wholly dead. The old religion could still wake up a passionate devotion in the hearts of its votaries. Philosophy could still make good her claims to assist those who submitted to her teaching in the right ordering of their lives. There went forth everywhere the teachers of a morality larger and purer than the heathen world had yet produced, Greek literature itself partaking in the revival, and enjoying in Plutarch and Lucian, the several representatives of faith and unbelief, in Arrian, in Epictetus, in Musonius, and in Dio Chrysostom a kind of later and Maritimus summer of its own.

It is, however, in private and social life that Plutarch shines especially, and that we most begrudge him to the Paganism which he adorned. His cheerful fulfilment of petty municipal offices, as being a citizen's duty; his family life graced by fraternal affection, and ennobled by a deep sense of the sanctity of marriage; his refreshing tours to this or that quarter of his fatherland, to realize the scenery of his famous dramas of biography; his pleasant gatherings of friends like-minded with himself for table-talk at home or at the sea-side, and his declining years sustained by heavenly hope and high humility, afford a charming portrait of a heathen at his very best; and we can but echo the Archbishop's astonishment that more has not been made of the "Symposiaca," where these characteristics are chiefly discoverable, in depicting the social life of Greece and Rome at that particular period. They would repay, withal, a closer search for the bons-mots and repartees to which no age is indifferent; such as that of Vespasian, when, to pay off Mestrius Florus, a consular archæologist, for admonishing him not to say "plostra," but "plaustra," he greeted him next day as Mestrius Flauros, "πλαῖρος" being an Attic form of *πλοῦτος*, i.e. good-for-nothing. It deserves to be known that it is Plutarch who enables us to trace to Philip of Macedonia the authorship of that circumlocution for "downrightness of speech" which has experienced a modern revival—"calling a spade a spade"; and we may add that among Plutarch's "Morals" are no small contributions to the lore of adage, apophthegm, and anecdote which we inherit from the ancients.

Very interesting is the key which Dr. Trench supplies to the aim and object of Plutarch in the work for which he is most famous. At the same time that he sought benefit to himself from the task as it grew upon his hands, his chief purpose was a patriotic desire to show what living Greece had been in its prime, and how well entitled it was to match with the best of Rome's later breed; and this, too, without partiality in his comparisons. He may have hoped by such parallelism to raise the sadly degraded tone of his contemporary compatriots, and to revive the race of Greeks which had degenerated into Grecklings; and it must be ever borne in mind, in the perusal of these *Lives*, that vivid moral portraiture, the ethical rather than the political aspect of the men he pits against each other, is the scope and purpose of his parallels. The chief faults laid at Plutarch's door are explicable and excusable, if this purpose is borne in mind. He was not critical, like Thucydides or Polybius—still less so if tried by the standard of modern writers of history—but his inaccuracies are comparatively unimportant if this ethical purpose is sufficiently recognized; and it is seldom that he can be convicted of such doubtless undesigned injustice as Mr. Grote brings home to him, touching the imputation of corruption and a vicious appetite for popularity to Pericles. The charge is disproved by the language of Thucydides, a contemporary (Thuc. II. 65, cf. Grote, *H. G.* vi. pp. 234-7). And even in this case we have an answer to another of the charges brought against Plutarch, that his summings-up are generally in favour of his own nation—an accusation which, had it been deserved, would have shown that at least he did not curry favour with the dominant race, but which is disproved by the fairness with which in the main he holds the balance. He deserves in truth the verdict of Dean Merivale, that in his fair and friendly comparison there is "no word of subservience or flattery, of scorn or vanity, of humiliation or triumph, to mark the position of the writer in the face of his Roman rulers." A minor charge of his traducers is that he was too ready to gloss over and half condone the faults of his heroes, but we think the only sense in which this is true is that charity dictated his judgments. As a moralist who saw how mixed a character man is, he made the best of what was good, and passed the worse part over lightly, "in reverent shame to the mere frailty of man's nature, which cannot bring forth a man of such virtue and perfection but there is ever some imperfection in him" (*Cimon*, 2).

The citation of these last words from North's Plutarch

* *Plutarch; his Life, his Lives, and his Morals. Four Lectures.* By Richard Chenevix Trench, D.D., Archbishop of Dublin. London: Macmillan & Co. 1873.

leads us to glance, though it must be briefly, at Shakespeare's indebtedness to that sound old English translator. This is most clearly defined by Dr. Trench. Not only did our great dramatist, here and there, as in the transference of Cleopatra's death to his play, rest content with adding nothing to the grand account of Plutarch as he found it in North—a contentment which is most notable in almost the whole of *Julius Cæsar*—but elsewhere, as in the funeral oration by Mark Antony (see Dr. Trench, p. 55), he expands a graphic touch of the biographer into a piece of dramatic pleading; and in all his loans from Plutarch or his translator he displays tact and appreciativeness of the very rarest kind. A signal instance of this is the fine passage beginning with "Towards die many times before their deaths," if we compare it with the hint of Plutarch in his *Life of Julius Cæsar*, out of which it grew. We are not concerned to examine Archbishop Trench's canon about plagiarism, which might be taken to justify one law for the rich and another for the poor in literary power and gifts; but it is beyond a doubt that, "had not Plutarch written," the *Lives of Coriolanus, Cæsar, and Antony*, Shakespeare's three great Roman plays "would never have existed, or would have existed in forms altogether different from those in which they now appear." Dr. Trench shows in the latter part of his second lecture that Milton too is indebted, probably directly, to Plutarch; and that our contemporary Mr. Browning has borrowed the framework of *Balanian* from the *Nicias* of Plutarch. On the general question of Plutarch's often-cavassed biographies we cannot cite a fairer criticism than that of the veteran George Long, who, in the *Dictionary of Greek and Roman Biography*, thus writes:—"The reflections of Plutarch are neither important nor trifling; his sound good sense is always there; his honest purpose is transparent; his love of humanity warms the whole. His work is and will remain, in spite of plodding collectors of facts and small critics, the book of those who can nobly think, and dare, and do. It is the book of all ages, for the same reason that good portraiture is the painting of all time; for the human face and the human character are over the same. It is a mirror in which all men may look at themselves."

Little space remains for noticing how much Archbishop Trench has done in these lectures in illustration of Plutarch's less known but not less important "ethical works"; which, as he puts it, set forth the accomplishments of the ancient world in the field of thought, just as the "*Lives*," from ideal points of view, exhibit what it accomplished in the world of action. These are to be read in English chiefly in the rare folio of *Philemon Holland*, as to the interest of which we had rather err with Southey than be right with Pope. Dr. Trench admirably explains the *raison d'être* of these moral treatises—namely, the craving for spiritual direction in Plutarch's day, which the lecture-room had to satisfy in the absence of the pulpit. A practical rather than a creative or abstract thinker, a philosopher who had little bias towards speculative refinements, and who, while he ridiculed the absurdities of the Stoic Porch, could not tolerate the Epicurean pessimism and inaction and belief in the Divine indifference, Plutarch was indeed, as far as his light allowed, a striver after truth, and a manful worker in the field of duty. As such he is exhibited by the internal evidence of many of his treatises, which inculcate the soundest and wisest lessons on "resistance of small temptations," on "discriminating flattery from friendship," on "holding fast the mean between superstition and atheism," on "the certainty of a Divine retribution sooner or later," and other equally vital questions. In some of these he touches on difficulties and suggests solutions which are familiar, as the Archbishop notes, to our own age. To depreciation of the Oracles on the ground of the faulty verses which could never have originated with Apollo, the god of music and song,

Plutarch, or one who evidently expresses his sentiments, replies very much as at this day it is replied, that the enthusiasm, though most truly a divine afflatus and influence, yet has human souls for the sphere of its operation, and will take much of its outward form and fashion from these; that the agitation of the spirit is divine, but that much after this is human, and is the result of the varying condition of different souls, or of the same at different times.

We have left a great part of the Archbishop's interesting reflections on Plutarch and his works unnoticed; but we hope we have done somewhat to draw to them such attention on the part of the reading public as cannot fail to revive the intelligent study of Plutarch, either in the Greek or through translations.

MR. HUBERT SMITH'S TENT LIFE IN NORWAY.*

MR. HUBERT SMITH has certainly found an attractive title for his book, for there should be much to interest in life with the gipsies anywhere, and especially in Norway. We have not been in the way of associating these somewhat senuous nomads with the fjelds and the fjords, with the short summers and tremendous winters of the frozen North, and a Scandinavian Borrow who should bring his novel experiences home to England would be almost certain of a great success. Unfortunately Mr. Smith has nothing to tell us of Norwegian gipsies at all; he did not travel with them, nor did he even light upon any, although he assures us that they do exist, and although their discovery formed one of the chief objects of his ex-

pedition. His gipsies are of English breeding, and he took them over with him. Still, although his title led us to hope for more, we should have quickly forgotten our first disappointment had his gipsy party proved more interesting or entertaining. Unfortunately, as it seems to us, the three recruits he picked up in the lanes of Gloucestershire are of very commonplace types indeed, and differ from the average English tramp only in using a sprinkling of Romany words and phrases. There are a couple of brothers bearing the Scriptural names of Noah and Zachariah, with a sister who had been called, if not christened, *Emeralda*. They are all young, and the sister, although scarcely so attractive as the heroine of Victor Hugo's romance, is by no means deficient in charms, while her morals are unimpeachable. To borrow the language of Mr. Smith, there was much that was impulsive and original, much that was impassioned and sensitive in the powers of appreciation of this wild flower of nomadic life; and as it is comparatively easy to put yourself in all honour on a familiar footing with an inferior of the opposite sex, we can understand her temporary master finding her society an acquisition. But it passes our powers of conception to understand how he succeeded in making his tour tolerable, not to say enjoyable, living on the terms he did with such loutish hobbledoys as her brothers. We have heard of adventurous travellers daring or suffering a great deal for an intelligible purpose. M. Arminius Vambéry travelled in the disguise of a filthy Moslem fanatic across the burning deserts of Central Asia; and the "Amateur Casual," having previously been immersed in fetid water, passed a miserable night in a workhouse ward with the foulest company. One and the other had their rewards, as they were doubtless supported by the hope of them. But Mr. Smith, who evidently is a man of education and refinement, deliberately chooses a couple of rough undressed gipsy cubs to share his board and become his intimate companions. They appear to have nothing of the native good breeding which you often find in respectable savages, as you do in Scotch gamekeepers or Swiss guides. On the contrary, they are loud and boisterous and vulgar; they vent the exuberance of their animal spirits in all manner of uncouth grimaces and contortions; and they pour out floods of what Mr. Smith calls "chaff" on the Norwegians who are attracted by the extraordinary spectacle of a gentleman going about in such very queer company.

There are forms of roughing it which most men naturally shrink from, however "hard" they may show themselves on occasions—such, for example, as dispensing with the morning bath. We can quite understand Mr. Smith finding positive enjoyment in his rough commons, his quarters under his gipsy tent, and even the sense of endurance under the attacks of bloodthirsty mosquitoes. But we cannot comprehend his caring to mess every day with those gipsy retainers of his; the mess-tent when the weather was wet being a blanket stretched upon hoops. Setting vulgar speech and coarse manners aside altogether, we think he mentions incidentally that Noah and Zachariah had each but a single suit of clothes, while we remember that they went long marches day after day in weather alternately wet and warm. There is no accounting for taste, it is true, and it is certain Mr. Smith himself seems to have had a very happy time of it. Yet we suspect that his must be a somewhat exceptional character; we doubt whether many of his countrymen will be tempted to follow his example, and we are sure that most of them will repent if they do. He seems blessed with a bright nature and easy temper, and a knack of making the very best of everything; while at the same time he plainly delights in being the centre of admiring groups, and is incapable of imagining that anything can make him ridiculous. It was a bold thing to start for Norway in such eccentric company, carrying his camp and its contents upon asses—a quaint species of animal that is altogether unknown there. In doing this he took the most effectual means of assuring his being stared at wherever he went, and, as a matter of fact, he was more or less mobbed in the most secluded districts he visited. It would seem a doubtful pleasure at best to come in after a hard march to perform your ablutions, toilet, and cookery, and subsequently to sit down to your *al fresco* meal under the curious eyes of a little crowd of profoundly interested peasants. But to stimulate the general interests of the country and to make quite sure that the popular excitement should never flag, the party resolved itself into an ambulant Philharmonic Company. They gave concerts wherever they stopped in the evening, and often at the midday halt as well. Mr. Smith favoured the public nightly with his favourite song of the "Mocking Bird," while even on the line of march the indefatigable Zachariah beguiled the way with the strains of a flute on which he was no great proficient. Most men would have felt that their having no means of communicating with their visitors and admirers added to the awkwardness of what was in any case a trying situation. Mr. Smith seems to have been conscious of no embarrassment of the kind, although he was master of barely a dozen words of Norwegian; and, thanks to his imperturbable good humour and that of his guests, his *soirées* went off very satisfactorily. His gipsies, as we have said, were lively and talkative enough, and their grimaces and gestures were sufficiently expressive, although fortunately the Norwegians understood nothing of their speech. Mr. Smith, however, could check their spirits at the wildest—a convincing proof that he had many of the qualities of a leader. Yet when we read of his breaking off from a romp with them, or of his asking Noah, "as he woke up rather wild," what he would take for his shirt-front of dirty paper, we cannot help thinking that master and followers were in a somewhat false position; and we

* *Tent Life with English Gipsies in Norway.* By Hubert Smith, Member of the English Alpine Club, &c. Henry S. King & Co. London: 1873.

do not wonder that occasionally he had to back up his words with a blow. Mr. Smith will object that we are pigs and unfitted to appreciate the pleasures of a gipsy life. Yet we can hardly sympathize with that stern rule of his small camp which forbade altogether the use of tobacco, or of stimulants, except as medicine. As to the stimulants we say nothing, although it must have been painfully tantalizing to the unlucky gipsies to see their master offering the brandy he denied them to every stranger who visited the camp. But we think it says much for Noah that he did not break out into open mutiny when his tobacco was stopped of a sudden without the semblance of a reason while he was living a life of exposure in the open air, and had neither his master's macintosh nor changes of raiment. The more so that Mr. Smith seems to be a smoker himself when he lives in cities; at all events, he carried cigars about with him, and was as hospitably liberal of them as of cognac. There is another point on which Mr. Smith stands upon the proprieties in a manner that is oddly at variance with his way of travelling and the easy freedom of his camp life. He is so deeply penetrated with a sense of the dignity of authorship that he invariably speaks of himself in that plural number which custom and convenience compel the journalist to assume. The practice sometimes becomes ludicrous, as when he writes of being asked whether "We" had brought our wife with us, as if he and his party had been members of that Indian tribe where woman is indulged with a plurality of husbands.

Mr. Smith's method of travel was this. He slept in a tent made of a couple of blankets stitched together, stretched over a stout ridge pole supported on pilant hoops. Dispensing with a regular bed, he lay on a waterproof and under a blanket. His table-service was naturally of the simplest; a kettle slung from an iron prop played the chief part in his *batterie de cuisine*. His travelling commissariat comprised Australian and other potted meats, hams, cheeses, rice, flour, biscuits, &c., and, above all, tea. For the rest the party depended on the trout which the gipsies caught occasionally, on a purchase of fresh or salted meat at rare intervals, and on the milk, eggs, and *fladbrød* which they could procure almost everywhere at the farmhouses. We cannot say that they lived well, and we are painfully impressed with the monotony of the *menus* that are recorded with such conscientious fidelity. A squatter in the Australian bush may content himself day after day with the eternal mutton, tea, and damper, for obvious reasons. But we cannot, for our part, see why Mr. Smith should have wasted a fine appetite on a diet that was almost as little varied, when he might often have sat down to an excellent meal at the very station-house where he bought his bread. No doubt his plan of life had its advantages and its pleasures. There was a sense of great independence, although that of privacy was wanting; you could stop very much where you pleased, for you had seldom to wander long in search of eligible camping ground; you had never to trouble yourself about *forbuds*, higgie over fresh horses for your carriages, or scramble for beds at the night quarters. But the absence of these worries was perfectly compatible with the enjoyment of the blessings which Providence throw in your way, and nothing but unusual consistency of principle could have enabled Mr. Smith to stick to his tent and his gipsies through the long wet days when there were rooms with roofs and windows to be hired anywhere in the neighbourhood. He does not even convince us that the life his party led was a particularly healthy one, although he never ceases to affirm it with the assurance of complete conviction. "Bronzed by exposure to the hot Norwegian sun," he exclaims enthusiastically, "hardened by rough, spare diet, and continual travel through all weather, ours was indeed a life of health, freedom, and pleasure." As for the health, in spite of citric acid served out as a substitute for vegetables and other anti-scorbutics, the spare diet brought the skins of the gipsies into such fearful condition that they could hardly have suffered more severely from mosquitoes had their blood been poisoned on the West Coast of Africa; and poor Emeralda in particular was always lamentably bilious if ever a day went by without its ordinary exercise. The pleasure, too, appears to have been often somewhat problematical. We may quote an example of that unflinching optimism of Mr. Smith's which set disagreeable realities at defiance, and steadily resolved to find enjoyment in everything:—"Notwithstanding our tent was pitched on the only available spot, consisting of loose angular stones, in spite of midges and mosquitoes, we were soon sound asleep. The English gipsies in Norway were long past that deplorable state of modern effeminacy when you are unable to sleep comfortably on a gorse bush with a bundle of thorns for a pillow." We are inclined to envy and admire the effects of a month's training, but envy and admiration vanish alike as we read in the very next sentence, "It had thundered and lightened and rained heavily in the night. We were all fearfully bitten with mosquitoes. Noah had been unable to sleep. Emeralda not much better. Mephistopheles (Zachariah) slept the best."

The most interesting part of the bulky volume is that which relates to their return southwards from Vehlunsmoes, the extreme point of their northern journey. It describes the ascent of the Galdhøppigen, the loftiest mountain in Norway, and a route by lofty fields which are but little frequented, along paths which would often have been perilous to any but good mountaineers. As it was, it was no light matter to force the donkeys across the frail wooden bridges fenced with light hand-rails that are often swung across ugly-looking chasms. The animals would hang back, even when they had been disencumbered of their loads, and hauling them over by ropes of bark ingeniously ad-

justed so as to secure the maximum strength of draught could hardly have been either safe or easy. Thanks, however, to pluck and cheerfulness, and the assistance and advice of an excellent Norwegian guide, man and beast arrived in safety at their destination. All this would have made the book more agreeable reading than it is, had it not been for a want of literary art and an absence of all sense of proportion. Mr. Smith makes just as much of such thrilling incidents as dropping a halter on the road or presenting a friendly peasant with an empty sardine tin, as he does of crossing the glacier of the Galdhøppigen or admiring the fall of the Morkia from the brink of a slippery slope with a rope tied round his middle. Indeed his diary gives us the idea of having been reprinted very much as it was written, and of each day's portion having been written as if it alone might possibly survive. Not only is the daily life that repeated itself with such regularity conscientiously chronicled, down to the minutest details of the meal, but time after time moral, ethnological, and psychological reflections are repeated in almost identical language, as if they had just occurred to the author, and must be entirely new to the reader. Yet with all its sins of omission in regard to that gipsy life which, as we fondly believed, was to give it its special interest, and with all those reiterations with which we could so well dispense, there is something about the volume that makes it very readable after all. Mr. Smith is so frank with us that we cannot help liking him; and his perfect frankness, with his fondness for detailed description, gives an individuality to the other members of his party that makes us follow their fortunes, commonplace as they are, with a certain interest. He might have imparted all the information he gives us in a tenth part of the space; and yet, had he done so, we doubt whether we should have liked his book the better, and we are sure we should have missed much that has amused us. Nor can we take leave of it without remarking that the sketches with which its pages are profusely illustrated are all lifelike, and many of them extremely spirited.

A VAGABOND HEROINE.*

MRS. EDWARDES made a good hit with *Archie Lovell*. An innocent Bohemian, horribly unconventional but not immoral, a tomboy with the potentialities of a charming womanhood when the time came for development, made a fresh kind of character that told well; but *A Vagabond Heroine* simply repeats and exaggerates this original idea, and spoils it. Belinda O'Shea, the vagabond in question, has none of the naive charm that belonged to her prototype, and is infinitely more disreputable. She is over-drawn on more points than one, and it seems to us that, to be true to nature, she should have been made either a trifle less uncivilized or more corrupt. She is a young girl of seventeen, who "knocks about the world" practically alone and unguarded, save for the not too sufficient defence of an old Spanish hound, and the care of a so-called governess, a strong-minded woman who neglects her duties while she fulfils her Mission, and accepts money for undertaking a charge which she abandons. Consequently Belinda passes most of her time in the streets, playing paume with a lot of boys, her "chums," from whom she learns the accomplishments of whistling like one of themselves, and how to garnish her talk with the choicest slang in four languages. Further than this, she dances the bolero like a real *lascu* peasant, among "three couples of men and girls, all of the lowest order of the people; not a shoe or stocking between them"—her own stockings, by the way, are in holes and of different colours, and her shoes are worn-out sandals of the country, "linen slippers roughly embroidered in scarlet, and bound high above the instep with worsted braid." But besides "all the originality of gesture, the supple strength, the staying power of the peasant," which she "possesses to the full," "she possesses something more, poor child! the graces born of mind as well as matter, the delicate, exquisite alternations of fire and languor, which are the very poetry of true dancing, and of whose seductive charm she is only too profoundly ignorant." To which last clause we rather demur. As still further indications of the character and acquirements of this Bohemian granddaughter of an Irish earl, it may be mentioned that she adores bull-fights as much as she adores paume and the bolero, knows all the improper stories and highly-flavoured scandal of the doubtful people who come to St. Jean de Luz, is insolent and bitter-tongued, absolutely disorderly, ignorant, and unthrifty, and more facile and direct in her love affair than a savage. This does not seem a very choice groundwork on which to embroider a flourish of womanly graces and seductive possibilities; but Mrs. Edwardes has not been afraid of her difficulties. If she has made her Frankenstein, she has kept it neatly in hand, and Belinda comes right in the end, though she does set out so queerly in the beginning.

The creatures who compose the world that has its being in *A Vagabond Heroine* are singularly unsatisfactory; and to people who have a lingering prejudice in favour of womanly sweetness and manly honour, the characters generally elaborated by Mrs. Edwardes seem scarcely worth the powder and shot wasted on them. Cornelius O'Shea, a weak reproduction of the famous Oostigan, and Rose his wife, an incarnation of vanity, folly, and heartlessness, as he is the incarnation of debt, tippling, and false sentiment, are the father and stepmother respectively of the

* *A Vagabond Heroine*. By Mrs. Edwardes, Author of "Ought We to Visit Her?" &c. London: Bentley & Son. 1873.

"Vagabond" whose fortunes are the mainstay of the story. The former she loves, the latter she despises; but the one is not worthy of her affection, and the other is almost too silly for her hate. But though Rose is such a worthless little fool, better men than Cornelius O'Shea find her admirable. It may seem natural that such men as he should feel for her the passion which it pleases them to call love, but it is surely odd that the hero, Roger Temple, should not have been keener-eyed as to her real character, or that, being so infatuated with her person, he should have been so profoundly weary of her society. We think Mrs. Edwardes has missed her way here, and has got entangled in contradictions when she designed only to weave subtleties. Again, how about Roger and Belinda? A man loves or he does not love. If he loves, and is anything better than a mere sensualist, he does not, on the eve of his marriage with one woman, fall headlong into a sudden passionate attachment for her stepdaughter. The dangerous moment was when he returned from India, bringing his ideal in his memory—the young married woman with whom he, as a boy of eighteen, had fallen in love, had had "scenes" and "passages," followed by the tender correspondence of years, and the preservation of faded flowers. That ideal was young, fair, modest, simple, silly always, and heartless always, but with a "sweet" manner that hid the real nature underneath as effectively as plating hides the baser metal. He comes back to find the reality a painted, dyed, simpering, middle-aged woman of fashion, of the most childish vanity and the most tiresome silliness. It was "Flora" as the outcome of "Dora"; but if his old love survived the first shock, and he loved Rose well enough to wish to marry her, and to be actually engaged to her, he would hardly have suffered himself to drift into such questionable relations as those he entered into with his future stepdaughter-in-law. The episode of Lagrimas is in the worst possible taste, and uncomfortably suggestive. Had he been other than the man of high honour and integrity we are told he was, it would not have been so strange. Men of loose morality do odd things, especially in ladies' novels; but being what he is, we do not think Mrs. Edwardes has treated him fairly; to make her virtuous hero, who is a gentleman, act so very like a scoundrel, is surely a piece of literary immorality deserving of censure. We do not say so much about the passionate episode of the past, because it is not much dwelt on; and Roger Temple was then but a boy, although Mrs. Shelmadene at six-and-twenty ought to have known better. Also, as we are made expressly to understand, the thing never came to real guilt, and was only a boy's passion and a young woman's light-headed coquetry. We can only say that Mrs. Edwardes has chosen a disagreeable line quite unnecessarily, and that she might have devised many other reasons why Rose and Roger should have been separated in their youth, rather than the primary fact of Mr. Shelmadene, and the secondary fact of Cornelius O'Shea. Mrs. Edwardes, like some of her sisters, has, we suspect, an idea that she can touch pitch and not be defiled, and play with questionable subjects innocently.

Besides these three persons—Major O'Shea, who marries two women, the one for her birth and the other for her fortune, breaks the heart of the one and dissipates the fortune of the other, and sinks into a dirty, dissipated, gin-drinking old insolvent; Rose, his wife, who has three ideas in her head, and only three—her dress, her beauty, and her lovers; and Captain Temple, who falls in love with the stepdaughter while engaged to the stepmother—there are two others, Miss Burke, Belinda's governess, and Augustus Jones, her lover. We scarcely know which of these two is the more objectionable. Perhaps the former is, on the whole, the more thoroughly disagreeable:—

Ten, fifteen years ago, say the traditions of Eastern travellers, Miss Lydia Burke used to haunt the hotels of Egypt and Palestine. She was a prettyish woman then; prettyish, unprotected, and, though not a girl, young enough to be regarded with suspicion by ladies travelling under the legitimate wing of husbands or brothers. Perhaps there were no really queer stories about her—I mean, perhaps none of the queer stories about her had real foundation. That she was in the habit of borrowing money from any man who would lend her money is matter of fact. But in those days, it must be remembered, Miss Lydia Burke had projects of founding ragged Jew schools in the Levant? Later on, she frequented the Alps; unprotected still; still short of money; an indomitable climber; Bloomerish in dress; rather less shunned by ladies than formerly—(alas, her prettiness was fading!) feared exceedingly by bachelor parties of young men, on whom, under various pretexts, she was wont to fasten with a cruel and leech-like tenacity. After this—well, after this, Miss Burke wrote a book *My Experiences*. Then, a little more Bloomerish, a little more faded, financial resources at a lower ebb than ever, turned up in London.

The book, a hash of doubtful Oriental narrative, and still more doubtful Exeter Hall piety, was simply below criticism; but, by one of those outside chances, occasionally to be met with in the world of writing as of men, it sold. It sold, and Miss Burke straightway manufactured a three-volume novel, carefully flavoured with the same kind of spice as before, but with the piety omitted, which did not sell. And then she became Earnest for life; shortened her skirts, had her jackets cut after the fashion of men's coats, wringed her way, ere long, upon platforms, I think made a speech or two about female suffrage, and began in common conversation to speak of women as Woman. And it was just when she had reached this melancholy turning-point in the downward road that the advertisement in the *Times* brought Belinda O'Shea into her hands.

Augustus Jones is simply a well-to-do snob, who drops his h's, and desiring to match his money with birth, thinks this ragged, unconventional, paume-playing Belinda O'Shea will do as well as any other, and so offers himself as the butt of her insolence and the mark for her satire, till he finally sees that the thing is impossible, and goes back to Clapham wrathful and disgusted. But, just as it is hard to reconcile Roger Temple's actions with the high sense of honour attributed to him, so is it hard to reconcile Belinda's

quasi-engagement to Augustus Jones with her fearlessness, her Bohemianism, and her truth. If the womanly instinct which expresses itself in the love of dress and jewelry was already awakened in her so far that she could gravely reflect on how life would look as Mrs. Augustus Jones, with money to spend in diamonds and lace, and loathing to suppress for the man who gave them, it was odd that she should have consented to go about in the "unwomanly rags" and unlovely fashions so minutely described by Mrs. Edwardes in the second chapter. She had enough money to buy herself a pair of stockings of the same colour, and a pair of new slippers, or she might have demanded them from Miss Burke. As for the theory that a radical change in habits and manners is brought about all at once by falling in love, we deny it as untrue psychology and contrary to experience. The change may be one of quick growth, but there must be some kind of growth. No girl leaps at a bound from such a questionable tom-boy as Belinda is, from being a mere *gamin* in a torn frock instead of a torn blouse, into a neatly-dressed, ladylike, well-conducted young person, conscious of her deficiencies, and prepared to accept not a trifling amount of martyrdom to remedy them. The change is too hurried, and the rapidity of the whole action becomes almost grotesque.

We wish our lady writers would leave off drawing these queer, unlikely, and unlovable heroines. Murderesses and *gamins*, idiots and adventuresses, seraphs bred in the mire and angels fashioned out of the dirtiest clay—we are tired of them all. They are fantastic caricatures of human nature rather than sober and life-like portraits; creatures that have no hold on our imagination or our sympathies; made-up specimens to which names are given, but which awaken no associations and give no pleasure. Cabinets of "curios" are all very well, but we prefer statues of natural proportions to odd-looking monsters. And all these unnatural and impossible heroines are as little like the real women of real life as are the six-handed or three-headed goddesses who may serve as emblems, but are absurd as artistic representations.

AMERICAN LITERATURE.

MR. SEWARD'S "Travels Round the World,"* narrated by his adopted daughter, Miss Olive Risley Seward, will of course be found to possess considerable interest, even though the distinguished traveller followed a tract which is by this time almost as well-worn as the once popular Grand Tour itself, and though neither himself nor his companions appear to have made any effective use of their peculiar opportunities of observation. They journeyed, as Americans mostly do, in a hurry; and though the rank and reputation of Mr. Seward commanded for them access to scenes which ordinary visitors would be debarred from entering, and to the very highest sources of political information in every country, they seem to have made less use of these advantages than we could possibly have expected. They appear to have been less anxious to obtain information respecting those secrets of Eastern policy and government which are of so much interest and importance to nations connected with the East by commercial and political relations, like England and America, and which have acquired new significance from the great revolution still in progress in the most vigorous and, till lately, the most exclusive of Oriental States, than to enjoy personal interviews with princes and formal communications with Ministers of a nature gratifying no doubt to the curiosity of the party—and especially of the ladies—as displaying the peculiarities of Oriental ceremony and political costume, but not affording any insight into the real politics of China and Japan. We should certainly have expected that a veteran statesman like Mr. Seward would not have visited the latter of these Empires without making earnest attempts to understand the extraordinary events of the last few years. But perhaps to him those events seemed little more than the natural effect of the contact of an intelligent race with European enlightenment and civilization, and Anglo-Saxon power and freedom. As an American Mr. Seward probably shared the belief of the majority of his countrymen that American ideas and institutions must perforce recommend themselves to all who come in contact with them; and that a feudal Empire like the Japanese must go to pieces of itself when touched by the all-penetrating spear of the democratic Ithuriel. As an Abolitionist, he had systematically undervalued those innate distinctions of race which our Indian experience has rendered familiar to Englishmen; and consequently the Japanese revolution may not have been to him—and certainly is not to the lady who records his experiences and conversations—the striking phenomenon that it appears to us. In China the point on which he dwells with most interest is the fact that America had peaceably obtained full participation in all that Europe had extorted by cannon and bayonets; from which, at least in his public utterances, he draws the absurd conclusion that everything that has been obtained by war would have been conceded to pacific methods. In Java he failed to perceive, or the recorder of his remarks fails to note, the existence of the only substitute for slavery that has ever proved effective with a tropical race imposed to voluntary labour—a system by which the State is the universal master, and directs the labours of the subject race to the profit, not of indi-

* William H. Seward's *Travels Round the World*. Edited by Olive Risley Seward. With numerous illustrations. New York: Appleton & Co. London: Sampson Low & Co. 1872.

vidual employers, but of the master-community. In Europe the chief interest of the travellers seems to have centred in the French Republic and in M. Thiers as its President; but there is not a remark recorded which indicates on Mr. Seward's part the slightest appreciation of the peculiar difficulties or exceptional conditions of the situation—of the reasons why Republicanism is so hateful to the better minds of France, and is associated in their thoughts with ideas the most repugnant to the Republicans of America. What is really interesting in the volume is the description of life and scenery, which we might meet in the work of any ordinary traveller; what is peculiar is the advantage Miss Seward has enjoyed of seeing for herself, or hearing described by her adoptive father, when fresh from the interview, the leading men of different countries, and the lifelike pictures she gives of their bearing and manners. She saw only what may be called the outside of life in all the countries she visited—scenery, ceremonial, and the best society on its best behaviour; but of all she saw she is a graphic portrayer. The illustrations which show us Japanese, Chinese, and Batavian buildings, dwellings, temples, and offices, and some of the portraits, are striking, if not very novel; the accounts of the few interiors she was permitted to visit are clear and real; and if we had expected less from the book we should probably have considered it a favourable specimen of American books of travel. We may notice that the writer is free from prejudice against England, and, coming on the English Empire on its Eastern side, where it is the representative of order, civilization, and commerce, she is disposed rather to admire and sympathize than to criticize and attack. Altogether the work is very pleasant reading, if not of the very highest order.

Father Thébaud, of the Society of Jesus, has written such an account of the Irish race * as might be looked for from a foreigner and a Jesuit. It would be extraordinary if any learned Roman Catholic, writing on such a subject, did anything like justice to the English conquerors of a race which has for many generations been a principal object of Catholic sympathies, or even recognized the fact that when first invaded they were regarded by Rome as something between heathens and rebels, whom the Norman conquerors were to reclaim to Rome and civilization. It would be yet more extraordinary if a priest could speak candidly of a policy whose primary object, indeed, was to extirpate barbarism and civil anarchy, but which was governed by the belief that anarchy and barbarism were in Ireland inseparably connected with Popery. Least of all can we expect a Jesuit to speak fairly of a Government which treated Jesuits as wolves in human shape, and showed them as little justice or mercy as they, when victorious, have shown to their enemies. Still Father Thébaud is a little wider in his assertions, and a little more reckless in his partiality, than can fairly be pardoned to his prepossessions and his profession. He ignores the fact that from a very early period the King of England was not only by title, but by repeated acknowledgment of the Irish chiefs, "dominus Hibernie," Sovereign Lord of Ireland; and he denies that the repeated outbreaks of the O'Neils and O'Connors were rebellions punishable by death and forfeiture. Nay, even the Geraldines, whose Norman name and English title of Earl testify to their English allegiance, he treats as victims and martyrs, not as ten times pardoned and ten times relapsing traitors. Of his representation of the rebellion of 1641 and of the subsequent retribution it is needless to say more than that it is what it might have been if the original documents had never been sifted and the story never told by English writers. A very important part of the history of the seventeenth century is missing from the copy sent to us; so we fail to follow him through the history of that famous Act of Attainder which combined nearly every form of injustice, treachery, and bloodthirstiness that could be embodied in a single Act of Parliament. But we may notice that he repeats that ridiculous misrepresentation of the Treaty of Limerick, so conclusively refuted by Lord Macaulay, which insists that Ginkell, who had just peremptorily refused to admit Catholics to municipal offices, engaged to admit them to Parliament; and he further states, in contradiction to other historians, and without quoting authority for the assertion, that a number of Catholics were returned to the first Parliament of William, and expelled by special measures adopted for the purpose. Of the future of Ireland Father Thébaud is of course hopeful. The Catholics are to recover their supremacy, and the right of parading the emblems of their religion through the streets under the eyes of Protestants; and of course the Protestants are to be severely punished if they dare to commemorate by similar processions the victories which saved their fathers from the tender mercies of the Catholic Ambassador who proposed suddenly and treacherously to massacre every Protestant in the island, and of the Catholic General who swept in thousands of women and children, many of them having the written protection of the King he served, to perish under the walls of Derry. But the reverend writer evidently regards with grave dislike the Irish emigration, and tacitly confirms the report that the Irishman, in quitting Munster or Connaught for America, escapes not only the imaginary yoke of the Saxon, but the much more real authority and ascendancy of the priest.

The Fourth Annual Report of the Massachusetts Bureau of the Statistics of Labour † reveals the existence of a sharp controversy

* *The Irish Race in the Past and the Present.* By the Rev. Aug. J. Thébaud, S.J. New York: Appleton & Co. London: Trübner & Co. 1873.

† *Fourth Annual Report of the Bureau of Statistics of Labour* embracing the Account of its Operations and Statistics from March 1, 1872, to March 1, 1873. Boston: Wright & Potter. London: Trübner & Co. 1873.

respecting the truth of the statements published on some former occasions by the same authority. The object of the Bureau is apparently to prove that in New England, as in the mother-country, the wages received by the lower class of skilled artisans and by unskilled labourers are not sufficient for the support of their families in decency and comfort. This they establish by setting against each other the average earnings of such a labourer and what they assert to be the average expenditure of a family in that rank—i.e. about seven hundred dollars a year. A careful examination of their statements will, we think, satisfy the English reader that the truth, according to his notions of decency and comfort, does not lie quite where the Bureau would place it. It is true that the cost of living in America has risen greatly since the war, and that wages have not risen in the same proportion; but then wages before the war were such as to afford a considerable margin. It is true that we cannot ascertain accurately the amount of deposits or the number of depositors in the savings banks belonging to the working class; but it is evident that the depositors must be numerous and their total savings very considerable. When we look at the accounts of expenditure furnished by the Bureau, we see that families represented to be so ill paid that they can hardly get on are spending from twenty to a hundred dollars on newspapers, books, "recreations," and the like. Wages, even for farm-labour, are confessedly about a dollar and a half per day on the average of the year; and the rate of city wages is still higher. Now in the country food is as cheap as it is here, or cheaper; and in the cities we find working-men complaining of a standard which would satisfy many middle-class families here. We find carpenters earning wages of three and a half dollars a day, and grumbling because they have to work in a draught. We find no distinct account of the present cost of any of the principal articles of food; but hints are given here and there of the quantity and quality consumed which would suggest the idea of luxurious indulgence to too many English labourers. Again, though rents are high, we find families occupying "four or five small rooms," who in London would have to be content with two. Taking all the facts together, we can hardly doubt that the actual reward of the labourer, in clothes, food, and shelter, is higher in Massachusetts than in Lancashire. If it were not, seeing that regions of ample work and abundant wages lie ten days nearer to Boston than to Manchester, we should have to suppose that American labourers were even more unadventurous and stay-at-home than our own.

Old New England Traits * is a little volume professedly of reminiscences of social life and manners, of domestic habits and ideas, in the States of the North-East in the first half of the present century; when the simplicity of colonial life still prevailed in the country districts, and the traditions of a time when nearly all the community consisted of comfortable yeomen, with no want and few superfluities, still lingered in the mouths and influenced the manners of the people. It contains plenty of characteristic anecdotes, and is flavoured strongly by the Puritan humour which Massachusetts inherits from those Pilgrim-Fathers who, having been the introducers of tyranny and persecution in the New World, are revered as the champions and martyrs of religious liberty in the Old. In like manner *Men and Memories of Francisco* † recalls the rough wild life, the fierce excitement of the days when the gold fever raged, and in a few weeks peopled California with the most enterprising and the most lawless spirits, with all the scoundrels and adventurers of the world. Such a time could not but furnish an observant spectator with many striking scenes, many memorable incidents, many strange characters, well worthy of being preserved for the entertainment or astonishment of later generations. We are bound to say that Messrs. Barry and Patton have somewhat disappointed us; there is far less of originality and force either in their selected subjects or in their style of treatment than might have been expected from men who had lived through that unprecedented time and in the midst of those strange scenes, and had shared the fierce excitement of the universal fever. The book is, in fact, tame and flimsy; savouring more of the forced humour of the professional jester than of the mingled comedy and tragedy, both so intensely real, which are revealed to us by glimpses in all true pictures, however slight, of that strange social anarchy.

The *History of the American Stage* ‡ is nothing more than a biographical dictionary of those who at different periods have figured as ornaments of various American theatres; it is a work whose very arrangement deprives it of any other value or interest than such as attaches to a mere book of reference. *An Essay towards an Indian Bibliography* § is something of the same kind; a list, as perfect as the author can make it, of every work in which the character, history, or fortunes of the native races of America are dealt with, accompanied by fairly sufficient accounts of the

contents, purport, and tendencies of the more important or less familiar publications on the subject.

Another addition * to the innumerable list of commentators on Shakespeare reminds us that our great dramatist is almost, if not quite, as much the heritage and the boast of the English beyond the Atlantic as of the English at home. When Shakespeare wrote, their forefathers were still living in their ancient homes, many of them probably ignorant, save by vague rumours, of the character and extent of the newly discovered continent of which Spain claimed exclusive possession; few or none of them had dreamt of visiting it in any other capacity than that of buccaneers; and his fame was rising above all rivalry, if not yet established on its present pinnacle of supremacy, when the Pilgrim Fathers established a colony from which plays, playwrights, and play actors were banished as things scarcely less abominable than Quakers or Papists. Of all our common inheritance of great traditions and glorious memories, nothing is now so familiar or so dear to Americans as Shakespeare's name; no monument of English antiquity so sacred in their eyes as his birthplace and his grave. And neither England nor Germany has furnished more eager or acute inquirers into his meaning and analysts of his genius than the United States. Mr. Hudson treats his subject in a four-fold aspect; he deals with the earlier history of the English stage, so necessarily connected with any just or rational appreciation of its noblest ornament; with the scanty memorials, records, and traditions of Shakespeare's life; with the scope of his art and the character of his genius; and, finally, with the sources of his plays, their purport, and the meaning of the principal figures therein, as conceived by the poet himself. It might seem venturesome to recommend any new work on a subject which, if not inexhaustible, would have been long ago exhausted; but as new commentators on Shakespeare still find readers, we may fairly set down Mr. Hudson's work as worthy of a high place among them.

Mr. Herron professes to have written his *Thoughts on Life and Character*† at by-moments, noting them down rather than elaborating them, and never working upon them as most men work at that which they intend for the public. We can well believe him when we compare his essays with those of more laborious, more modest, and perhaps more ambitious students. Perhaps if he had worked hard at them they might have been polished into more attractive form, and sifted so as to bring their value into some proportion to their bulk. As it is, they seem to us to form no exception to the general rule that an author has no right to offer to the public that which has not cost him the best work of which he is capable; and that, if he does, the public is likely to requite him as he deserves.

Mr. Stafford's memoir of James Fisk‡, is written, printed, and finished in a style worthy of the subject, and we can say no more. It is a book which many people may like to read, and which almost anybody might be ashamed of reading—except a critic, who must perforce read very many less lively, and some more offensive works.

Mr. J. Harris, not the "seer who lives at Poughkeepsie," undertakes an elaborate essay on Centrifugal Force and Gravitation§, to get rid of Kepler's laws, demolish the Newtonian system, and establish a new Theory of the Tides. Unhappily Mr. De Morgan's *Budget of Paradoxes* is closed for ever; and few living men have at once the taste to deal with the like topics and the skill to render them at once intelligible and interesting.

Miss (or Mrs.?) Phelps's *What to Wear?*|| is a criticism on some of the most glaring and anti-hygienic absurdities of female apparel in its present and recent fashions; a protest sensible and salutary, but likely, we fear, to be about as effectual as the thousand previous remonstrances put forth through the press, and the million expostulations daily uttered by fathers of families, without abating by one hair the weight of the chignon, or by one line the length of the dragging skirt.

Of three American schoolbooks on our table, one is a *Youth's Speaker*¶, or selection of pieces for declamation in prose and verse; a second is a child's (and childish) abridgment of American history**; and the third is a "Short Course of Astronomy"††,

* *Shakespeare: his Life, Art, and Characters. With an Historical Sketch of the Origin and Growth of the Drama in England.* By the Rev. H. N. Hudson. Boston: Grim Brothers. London: Sampson Low & Co. 1872.

† *Thoughts on Life and Character.* By S. P. Herron. Philadelphia: Lippincott & Co. London: Trübner & Co. 1873.

‡ *The Life of James Fisk, Junior.* A Full and Accurate Narrative of his Career, his Great Enterprises, and his Assassination. By Marshall P. Stafford. Published by the Author. New York: Polhemus & Pearson. London: Trübner & Co. 1872.

§ *Centrifugal Force and Gravitation.* A Lecture. By John Harris. Manchester: John Lovell. London: Trübner & Co. 1873.

|| *What to Wear?* By Elizabeth Stuart Phelps, author of "The Gates Ajar." Boston: Osgood & Co. London: Trübner & Co. 1873.

¶ *Cathcart's Youth's Speaker.* Selections in Prose, Poetry, and Dialogues, for Declamation and Recitation; suited to the Capacities of Youth, and intended for the Exhibition Day Requirements of Common Schools and Academies. Illustrated. By George R. Cathcart, A.M. New York and Chicago: Ivison, Blakeman, Taylor, & Co. London: Trübner & Co. 1872.

** *Sweden's Primary United States: First Lessons in Our Country's History, bringing out its Salient Points, and aiming to combine Simplicity with Sense.* By William Swinton, A.M., author of "Condensed History of the United States," "Word Analyst," &c. &c. With numerous Illustrations. New York and Chicago: Ivison, Blakeman, Taylor, & Co. London: Trübner & Co. 1872.

†† *A Short Course in Astronomy and the Use of the Globes.* By Henry Kiddle, A.M., Superintendent of Schools, New York, author of "New Manual of the Elements of Astronomy." New York: Ivison, Blakeman, Taylor, & Co. London: Trübner & Co. 1872.

which alone of the three seems suited to the purposes of real and effective instruction, or gives us a favourable idea of the teaching to which such works can be adapted.

The *Lynx Hunters** introduces to us once more that group of boy adventurers whose experiences in the woods, and on the waters we have already more than once heartily commended to the attention of English lads and the choice of English parents. The "Scintillations"† are a series of passages, chiefly short, from the prose writings of Heine, and, despite the double disadvantage of selection and translation, may well be enjoyed by those to whom the original is inaccessible.

Two works of a scientific character deserve more notice than we can give them here. Major-General Barnard's "Problems of Rotary Motion"‡ come forth under the voucher of the Smithsonian Institution as a highly valuable "contribution to knowledge," accessible only to thorough mathematicians. Mr. E. C. Seaman's "Views of Nature"§ would require from the critic who should attempt to deal with them a close investigation of some very eccentric views, and a refutation of some notions of "nature" utterly contrary to facts supposed by the general body of recognized naturalists to have been clearly and finally ascertained.

* *The Camping Out Series.* Vol. IV. *Lynx Hunting.* From Notes by the Author of "Camping Out." Edited by C. A. Stephens. Illustrated. Boston: Osgood & Co. London: Trübner & Co. 1873.

† *Leisure Hour Series.* *Scintillations from the Prose Works of Heinrich Heine.* I. Florentine Nights. II. Excerpts. Translated from the German by Simon Adler Stern. New York: Holt & Williams. London: Sampson Low & Co. 1873.

‡ *Smithsonian Contribution to Knowledge: Problems of Rotary Motion presented by the Gyroscope, the Precession of the Equinoxes, and the Pendulum.* By Brevet Major-General J. G. Barnard, Colonel of Engineers, U.S.A., &c. &c. Washington: published by the Smithsonian Institution. London: Trübner & Co. 1873.

§ *Views of Nature and of the Elements; Zones and Phenomena of Nature and of Mind.* By Ezra C. Seaman, author of "Essays on the Progress of Nations," and of a Work on the American System of Government. New York: Scribner, Armstrong, & Co. London: Trübner & Co. 1873.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

The SATURDAY REVIEW is duly registered for transmission abroad.

Nearly all the back Numbers of the SATURDAY REVIEW may be obtained through any Bookseller, or of the Publisher, at the Office, 38 Southampton Street, Strand, W.C., to whom all Communications relating to Advertisements should likewise be addressed.

THE SATURDAY REVIEW

POLITICS, LITERATURE, SCIENCE, AND ART.

Price 6d.

CONTENTS OF No. 935, SEPTEMBER 27, 1873:

Victor Emmanuel at Vienna and Berlin.
The Dover Election. The Civil Wars in Spain.
The Canadian Scandal. The Royalists and the Count of Chambord.
Legislation in Over-Doses. Professor Bullivant's Appointment.
Mr. Forster on Capital and Labour.

The British Association.
The Pleasures of a Moor. The Polish Expedition.
Agricultural Unions and the Clergy. The Old Catholic Congress at Constance.
Confederated Home. The Battle of Newport.
The Theatres.

Golkin's Religious History of Ireland.
Blackwall's Researches in Zoology. The Atlantic to the Pacific.
Pillars of the House. Archbishop Trench's Pintarch.
Mr. Hubert Smith's Tent Life in Norway. A Vagabond Heroine.
American Literature.

CONTENTS OF No. 934, SEPTEMBER 20, 1873:

The Ashantee War—The Count of Chambord and Marshal MacMahon—Income-Tax
Fallacies—The Dover Election—Progress of India—The Speaker and his
Labourers—Home Rule and the Irish Priests—Descriptive Reporting.
Commercial Morality—The Old and the New Era of Schools—Dual Government in
the French Army—Opposition Horrors—A New Way to Pay Small Debts—
Gentlemen Emigrants—Archbishop Manning's Pastoral—The Game-Laws in
Scotland—Art at the Vienna Exhibition—Racing at Doncaster.
Symond's Studies of the Greek Poets—The Pearl of the Antilles—Alfred's Gregory—
Miranda—Politics for Poor Pilgrims—Aftermath—Taylor's Sound and Music—
Tegetmeier's Poetry Book—The Wrong Man—German Literature.

London: Published at 38 SOUTHAMPTON STREET, STRAND, W.C.

ADVERTISEMENTS.

CRYSTAL PALACE.—Saturday Concerts and Afternoon Promenade Series of the SATURDAY CONCERTS will COME ON at Crystal Palace on October 4. There will be Twenty-five Concerts. Between twelve and fourteen after-orchestras. The Band and Chorus will be of the same strength as during the season. Conductor, Mr. HANNA. Transmissible Receipts for the Twenty-five Concerts. Two Guineas each. Certificate of Admission to the Palace, will be ready for issue at the Ticket Office from this day.

THE ELECTIONS.

THE return of Captain HAYTER for Bath has taken both the friends and the adversaries of the Government by surprise. Three elections have now been held at Bath within six months, and in the first the Conservatives had a decisive, and in the second a smaller, but still a clear majority. Now a Liberal has been returned by as great a majority as that by which the Conservative candidate was defeated at the last general election. It is a long time since the Ministry has had any crumb of comfort so satisfactory, for the Bath election has checked the tide of Conservative successes; it has shown that the divided Liberal party is once more capable of union, and it justifies to a considerable degree the resolution of the Government not to dissolve Parliament at present. Success is also always doubly pleasant to those who win when it happens to be peculiarly mortifying to those who lose; and the result of the Bath election has been made peculiarly unpleasant to the Conservatives by the fact that their triumph at Bath seemed to them so certain that it was taken by their leader as the theme of a party manifesto. Mr. DISRAELI has owed much of the success of his extraordinary career to his prudence, his patience, and his reticence. But for once he seems to have been unable to resist the feelings of elation with which the recent victories of his party have filled him, and in an evil hour he penned a letter to Lord GREY, the sitting Conservative member, which was as injudicious as it was possible that such a letter could be. It assumed a Conservative victory to be so absolutely certain that it characterized Bath as leading and sustaining public opinion, so that defeat was made at least as significant as success. It then went on to describe the career of the Ministry in a series of reckless epigrams, and ended by inventing what was intended to be the happy and stinging phrase of "plundering and blundering" as the special characteristics of Mr. GLADSTONE's policy. It would have been impossible to devise any phrase better suited to determine the action of Liberal waverers. The two great measures of plundering to which it may be presumed Mr. DISRAELI referred are the Irish Church and Land Acts. Now, whether these Acts were bad or good in themselves, it is at any rate unmistakable that they were passed with the hearty support of the Liberal party. The whole party fought for them, believed in them, and carried them, and to speak of them now as examples of plundering was to stir the memories and awaken the indignation of all those who had taken the winning side in the fierce contest of five years ago. Blundering, as a term applied to the recent conduct of the Ministry, is not one with which most candid Liberals have any fault to find. It is the fatal series of blunders into which the Government has been betrayed that has more than anything else alienated from it the support of Liberal constituencies, and the Conservatives naturally received the benefit of the hope that, if they were in office, they might do better. But if "blundering" is a reproach to the leaders of a party, what greater instance of blundering could be wished for than the composition of Mr. DISRAELI's letter? If the Opposition are led by a politician who at a critical moment shows himself ready to sacrifice fairness and moderation to the pleasure of packing together sonorous epigrams, there seems little use in looking to the installation of the Opposition in office as a means of guarding the country against the danger of Ministerial blunders.

The vicissitudes of local politics are hard for strangers to understand, and it is very possible that Captain HAYTER might have won even if Mr. DISRAELI had not come to his

assistance. But just now, when the country is in an undecided and critical state, the effect of Mr. DISRAELI's letter will tell much beyond Bath, and will discredit his party even more than their failure to carry an election which they proclaimed to be won before a voter went to the poll. And it so happened that on the same day when Mr. DISRAELI's letter was published, Mr. BRIGHT also addressed the public through the electors of Birmingham, and his address was as judicious and sensible as Mr. DISRAELI's letter was injudicious and blundering. Beforehand, most people would have calculated that Mr. DISRAELI was sure to keep quiet and avoid any gross mistake, while Mr. BRIGHT might probably write something that would commit the Ministry and alarm the constituencies. Exactly the reverse has happened. While Mr. DISRAELI has done his best to damage himself and his party, Mr. BRIGHT has published an address dignified, moderate, and perfectly unobjectionable. He has steered clear of all dangerous matter. He has not gone over the grounds of the past services of the Ministry with which we are all so painfully familiar, and he has not made any indiscreet revelation of the intentions of the Ministry for the future. As it is because he has accepted office that he has to seek re-election, he has confined himself to explaining why he has accepted office, and his explanation is simply that he thinks he can do more good as a Minister than as a private member of Parliament. The main objection to a man of independent character and position accepting office is that he may chance to lose his independence; and Mr. BRIGHT meets this objection by saying that, if he finds any likelihood of this danger befalling him, he will immediately resign the office he has accepted. It is, as he justly puts it, a mere question of confidence between him and his constituents. They know what are his political principles, and he asks them to trust his judgment when he says that he can do good as a Minister, and his honesty when he says that he will only hold office while office costs him no sacrifice of principle. There is nothing wonderful or meritorious in a Minister using language which is so natural and even commonplace; but there are moments when to say nothing but what is natural and commonplace is the best means of winning public confidence and sympathy, and if "blundering" is to be the talk of the day, a Minister who can show himself capable of avoiding the slightest approach to a blunder may be rendering a conspicuous service to his party.

The fate of the SOLICITOR-GENERAL is to be decided early next week, and it is possible that the Liberal success at Bath may do somewhat to produce a similar result at Taunton. At any rate Mr. JAMES speaks very hopefully of his chances, although he seems to be greatly vexed and harassed by the proceedings of certain females who agitate in favour of suffrage for women, and who have adopted the pernicious habit of calling on the wives of Taunton voters while their husbands are away, and informing them that they are slaves. Mr. JAMES is known to have very decided opinions against giving the suffrage to women, and he has done perhaps more than any one to render the project ridiculous in the eyes of the present House of Commons. He is therefore an object of peculiar detestation to these female agitators, and they are doing their very utmost to secure his defeat. He is well aware of their animosity, and knows that not only at Taunton, but everywhere else, they will work to keep him out of Parliament. But he has the proper courage and spirit to defy them, and to declare that he would rather lose ten elections than lend any countenance to a proposal which he considers dangerous and absurd. Nor is he at all afraid of openly challeng-

ing his enemies; and he had the boldness to describe them as women who, because they had been social failures, aspire to be political successes. We can only hope that his courage may be imitated by other Liberal candidates. At Hull Mr. REED, of Admiralty fame, has come forward as the Liberal candidate, but he does not seem to speak with much assurance of success. There is a local man who is terribly strong, and who wants to get into Parliament; and Mr. REED evidently thinks that the local magnate will win. On the score of courage there is little to complain of in Mr. REED. He will have nothing to do with the Permissive Bill, and although he thinks that the Nonconformists are in some way injured by the working of the Education Act, yet he is a zealous friend of the Church, for the benefit of which he has indeed in his pocket a private scheme of reform, the result of which is to be that all meritorious clergymen will rise to the top of the tree. Mr. REED appears to be in that elementary stage of political knowledge and thought in which there is a natural belief that every evil can be met with a prompt and easy remedy. Wise and good clergymen often remain unnoticed, and so Mr. REED immediately thinks that a plan may be devised to give them all the preferment they deserve to have. Mr. REED wishes to see the Income-tax abolished, but only on condition that it is replaced by a tax falling on exactly the same classes, and free from the objections to which the Income-tax is exposed; and he treats the discovery of this tax as the easiest thing in the world. He is also troubled by the thought of the sufferings and inconveniences caused by the high price of coal, but he thinks that the whole difficulty may be easily surmounted by the State buying up all the coal-mines and selling coals cheap. We must own that this is the kind of political talk that we have been accustomed to look for from the lips of those whom female agitators call "slaves," and we should not have thought that it was of a sufficiently masculine cast to make much impression on the electors of Hull. Mr. REED seems scarcely the candidate whom a party puts forward which expects to win; but then if, after all, he succeeds in defeating the great local Conservative, so much the more brilliant will be the Liberal success.

M. THIERS AND THE FUSION.

M. THIERS has at last assumed the leadership of the Republican party, and his letter to the Mayor of NANCY is his first move in the campaign against the Fusion. A single stinging sentence gives his estimate of the moral value of the Monarchical movement:—"Without any mandate, without any powers, without the presence of the Assembly, a few people are treating of the entire future of France—a future which it is proposed to decide almost without discussion, and above all without an appeal to the country, the party principally interested, and the sole legitimate sovereign." The Ministry and the Fusionist leaders are alike open to M. THIERS's censure; but they are open to it for different reasons. The latter may plead that they have no wish to anticipate the action of the Assembly, and that it was merely by an accident that the visit of the Count of PARIS to Frohsdorf took place in the recess and not in the Session. But the Executive cannot clear themselves of the charge of endeavouring to influence the decision of the Assembly unfairly. They allow agitation in favour of a throne not yet in being, but they repress agitation in favour of the existing Republic. Royalists may say and write what they please, but the newspapers which report a speech of M. GAMBETTA are forbidden to be sold in the streets, and the Republican journals are suppressed without mercy in the departments in which elections are approaching. The charge of wishing to decide the future of France without an appeal to the country holds good against the whole Monarchical party. Indeed, to state it in this way is to state it mildly. The Royalists are not simply bent upon dispensing with an appeal to the country; they are bent upon it because they know too well what the answer to the appeal would be. But for this conviction, they would naturally welcome a dissolution. If they could bring themselves to do this, they would at once shut the mouths of their adversaries. Not a word could be said against the projected Restoration if its promoters were willing to take the opinion of the constituencies, and to abide by the result of a general election. There can be no question that, if they

were not afraid of the verdict, they would willingly submit to this trial. Nor can there be much doubt that their unwillingness rests on well-grounded conviction. If they were only a Parliamentary party, having no special relations with the Executive, it might be set down to mere timidity. But though the Government of the Duke of BROGLIE is avowedly aiming at a Restoration, it is sufficiently associated with those who have this object in view to put all its information at their disposal. If the Prefects had reported favourably of the dispositions of the constituencies towards the Count of CHAMBOEN, we may be sure that the Royalist agitators would have heard of the fact. The real motive of the Royalist dislike of a dissolution is further shown by the unwillingness of the Conservative candidates for the four vacant seats which are to be filled up on the 12th of this month to declare themselves Monarchists. There is no reason to suppose that these four constituencies are specially Republican; on the contrary, the Royalists express themselves sanguine of success in every one of them. If a Restoration is popular in France, it is strange that no Conservative candidate should try to make capital for himself by frankly putting it forward as the end to which, if returned, all his efforts will be directed. Instead of this, their addresses are filled with the vague phrases about order, property, and resistance to Radicalism which were in fashion before the Conservative coalition of the 24th of May had developed into the Royalist Fusion. This strange abstinence from the one subject which occupies the thoughts of the nation is pretty significant of the estimate which the candidates and their backers have formed of the views of the constituencies whose confidence they solicit. The determination of the Royalists not to consult the country before revolutionizing the form of government supplies of itself sufficient justification for M. THIERS's assertion that the Republican party will soon be called upon to defend "not only the Republic, but all the rights of France." It is idle to apply the term Liberal or Constitutional to a Monarchy set up by an Assembly which dares not face those who elected it. What M. THIERS says of the Tricolour is equally true of Parliamentary forms. If they remain only to mask the counter-revolution, they "would be the most odious and revolting of lies."

Happily for France, the conditions of the approaching contest between the Republicans and the Monarchists are determined by the character and position of Marshal MACMAGON. So long as he is President of the Republic the struggle will be fought out in the Parliamentary arena. The view which he takes of his duty to his country may be unduly narrow, but at all events it is thoroughly honest. A larger and more accurate conception of that duty might lead him to withhold his recognition from any change in the form of government which the Assembly may make until that change had been ratified by the electors. It is probable, however, that Marshal MACMAGON will not regard the competence of the Assembly as a matter which it is open to him to question. If the Assembly votes a Restoration, he may be expected to give effect to that vote just as he would give effect to any other. On the other hand, he may be trusted not to accept any Restoration which does not bear the stamp of the Assembly on its front. Consequently the decision rests upon the vote which to all appearance will certainly be taken early in November. Though it would be far more advantageous for the Republicans if the issue had to be decided in a new Assembly rather than in the present one, it is still a gain to them that it should be decided by the Assembly rather than in some less regular fashion. Outside the Assembly an unscrupulous Executive has virtually uncontrolled power; but, however resolved the Ministry may be to use their authority in the interest of the Monarchical conspiracy, they cannot exclude the Republican deputies from the tribune, nor, unless they are prepared to go to yet untried lengths in the direction of repression, can they prevent their speeches from being circulated through the country. In this way the electors will be kept informed of what is going on at Versailles, and, if they have reason to distrust the vote of their representatives, they will be able to bring timely pressure to bear upon them. There must be a good many members of the Assembly who would have no objection to a Restoration if they thought that it would not cause any decrease in their own importance. They probably foresee that one natural effect of the re-establishment of a legitimate and hereditary monarchy will be the reconstitution of a legitimate and hereditary aristocracy, and, if they are to hold their own in the presence of this

revival, it can only be by remaining members of the popular branch of the Legislature. If the fact that they voted for a Restoration is to be produced against them with fatal effect whenever they have next to face their constituents, it may turn out that they have played a losing game for themselves; and the fear of eventually making this discovery may have a decisive influence on their action in the division.

It is an immense gain to a Parliamentary party that it should be led by M. THIERS. His appearance as the leader of the Republicans will tend to influence the result of the contest, directly and indirectly. If parties should prove to be at all equally balanced, its direct influence may be very considerable. There are sure to be some genuine waverers in the Assembly; men who are honestly in doubt as to which way the interests of France require them to vote. France, they say to themselves, stands in urgent need of order and tranquillity, and the secure enjoyment of property; and these are exactly the good things which the Conservatives tell them must inevitably accompany a Restoration. When they listen to M. THIERS on this point, they will listen to a man who has actually given France order and tranquillity and the secure enjoyment of property, under circumstances which seemed to threaten the loss of all three. A statesman who has done this has earned the right to be heard on the question how these blessings can best be secured for the future. When he declares, as he does in his letter to the Mayor of NANCY, that the Republic is the only form of government capable of rallying widely divided political parties, and of speaking authoritatively to the democracy, and when he appeals, in proof of its power to do this, to similar triumphs already won under his guidance, he uses language that will come home to many moderate Conservatives. When these same views are expounded in the Assembly with that Parliamentary eloquence of which M. THIERS is almost the only master left in France, they may possibly win sufficient votes to turn the scale in favour of the Republic. The rumour that M. THIERS will use his great Parliamentary influence to support Marshal MACMAHON'S continuance in office is probably true. We pointed out at the time of M. THIERS'S resignation that there was great reason to suppose that he intended his abandonment of the office of President to be final. In his hands the post was an anomalous compound. M. THIERS was half a Constitutional King and half a Parliamentary Minister. The feeling of the Conservative party was against his sinking the former character in the latter, while his own feeling was still more decidedly against sinking the latter character in the former. Supposing that the Republic comes out victorious from the coming battle, the Duke of BROGLIE and his colleagues can hardly continue in office, and a Government in which Marshal MACMAHON remained President, and M. THIERS became Prime Minister, would go far to realize the ideal of a Conservative Republic.

THE ASHANTEE EXPEDITION.

THE innumerable warnings and remonstrances which are every day evoked by the Ashantee expedition probably convey to those who are charged with the preparations some useful suggestions; but the general tone of the one-sided controversy is in the highest degree discouraging. In all practical and theoretical matters special knowledge, though it may be useful or even necessary, is neither sufficient nor exhaustive. After all the details which have been published, it may safely be taken for granted that the enterprise is not impracticable. In all ages of the world greater undertakings have been accomplished, for the most part with less abundant means. It would have been easy to have foreseen that the retreat of the Ten Thousand or the conquest of Mexico was impossible, especially as both enterprises commenced without a commissariat in an utterly unknown country. In the present instance the Government and the military authorities seem to display commendable prudence and foresight in providing all material supplies with a liberality which is probably the soundest economy. There is no reason to believe that the preservation of the health of the troops, even on the coast of Africa, is beyond the reach of medical and sanitary science; and the force which will be collected at the seat of war will undoubtedly be more than a match for any number of barbarians. There never was a more absurd, or probably a less sincere, demand than the appeal to the

Government to hold an autumnal Session for the discussion of the war. In some cases it might be proper to consult Parliament on the expediency of a political rupture or of an aggressive campaign; but if the Government is fit to discharge the simplest duty, it is competent to determine that an attack on the national territory in any part of the world shall be effectively repelled. The House of Commons would properly avow its own incompetence to regulate the military and naval preparations which may be required; nor would even the Opposition speakers who affect to desire the convocation of Parliament commit the absurdity of superseding the responsibility of the proper administrative departments. A resolution that it was expedient to leave the Ashantes in the peaceable enjoyment of their recent conquests would scarcely receive the support even of the members who voted for Mr. RICHARD'S motion in favour of arbitration. The Peace Society, which has naturally taken the opportunity of advertising its own continued existence, proposes no mode of dealing with a difficulty of which the existence can scarcely be denied.

If the unwelcome necessity of a war has arisen from errors of policy or administration, inquiry, and perhaps censure, would be strictly consistent with constitutional theory. Parliament, indeed, allowed the Dutch Treaty of Cession to be ratified without any expression of disapproval; but if the Government which negotiated the arrangement committed any mistake which has subsequently been discovered, it is right that those who alone were familiar with the details of the subject should, even after a formal sanction, be held responsible for their conduct. At present there is no proof that any proper precaution was omitted. The English Government refused to accept the transfer until the Dutch title was shown to be free from incumbrance. The King of ASHANTEE received formal notice that Elmina would be held by England in full sovereignty, and that the relations which might be implied by the payment of tribute could not be allowed to exist; but at the same time he was offered an annuity of double the amount which he had received from the Dutch authorities, and he was informed that his subjects would at all times be allowed free access to the coast. It was right that the condition of the tribes of the interior should not be injuriously affected by a territorial arrangement which suited the convenience of two European Governments; but it would be intolerable that a savage potentate should be allowed a veto on a proposed treaty between England and the Netherlands. That any change should cause irritation, or perhaps be thought to afford a safe opportunity for aggression, is perfectly intelligible. It is unlucky that the King of ASHANTEE'S caprice or calculation should involve the English nation in trouble, risk, and expense; but it is a hasty conclusion that the more intelligent and more peaceable of two combatants must necessarily be in the wrong. The charges of cruelty and of other evil practices and propensities which are advanced by indignant partisans of the Government against the King of ASHANTEE are in the highest degree irrelevant to the merits of the quarrel; yet a potentate who, unless he is libelled, murders his subjects in large numbers on frivolous pretexts, may be supposed to have lax notions on questions of international law. It is only occasionally and indirectly the duty of civilized Powers to interfere by force for the correction and improvement of the manners of barbarians; but there is no reason for protesting against any moral lesson which may be incidentally administered during the process of asserting the right of self-defence.

It is premature to decide on the expediency of reducing the offending ruler to a condition of political dependence. As might be expected, the steady votaries of complacency are already shocked at the possibility that victory might result in the establishment of a protectorate. It may be admitted that, as a general rule, it is not desirable to undertake fresh liabilities, but Indian experience has shown that it is sometimes necessary or politic to convert enemies into subjects. If all the princes of India were at the present moment theoretically and practically independent, the country would never be free from war. The *Roman Peace*, which conferred vast benefits on the world, is necessarily imitated by all Imperial nations. The confusion which now prevails in the Feejee Islands illustrates the difficulty of dealing with outlying subjects who have brought themselves into contact with turbulent savages. Notwithstanding the reluctance of the English Government for many years past to extend the national dominions, it is becoming more and more difficult to tolerate the anarchy which will apparently only be terminated by an assumption

of sovereignty. In spite of Peace Societies, and of constitutional pedantry, English traders and adventurers continue to find their way to every unoccupied portion of the world; and in their dealings with indigenous tribes they constantly inflict and suffer wrong. Their own Government is at last unwillingly compelled to discharge the corresponding functions of protection and coercion; and unless the backwardness of England makes room for the interference of the United States, the islands will within a few years almost certainly become a part of the Colonial Empire. The traders on the Gold Coast have an older and a stronger claim to the good offices of the English Government; and even if the settlements were abandoned in consequence of the Ashantee invasion, the same traders or their successors would in a short time renew their demand for protection. The commercial capabilities of the coast, whether or not they are worth the expense of occasional wars, are found by experience sufficient to tempt commercial adventure. The question of defending English interests cannot be decided by a mere calculation of loss and gain.

In one sense it may be considered an advantage that the campaign will necessarily be short. The English troops must leave the country early in the spring, before the hotter season commences. By that time it may be hoped that a decisive blow will have been struck, and the organization of native levies will probably be complete. It is not yet known whether the Government intends to despatch any force from India, where there are some irregular native troops which possess a special aptitude for fighting in the bush. It is but too certain that, with or without a successful result, the expedition will be costly. All modern improvements in the art of warfare tend to increase expense, while they greatly add to the superiority of civilized nations over savages. The Russians, who possess an enormous army, thought it prudent, notwithstanding the comparative scantiness of their financial resources, to make the most elaborate preparations of all kinds for the invasion of Khiva. The complete accomplishment of their enterprise at the first attempt was abundant compensation for the preliminary outlay. The House of Commons has never refused or grudging supplies which are required for the maintenance of the national honour; but any waste which may have been committed will be properly criticized when it becomes necessary to provide for the expenses of the war. If Parliament had been consulted beforehand, the Government would have been enjoined to take every precaution for the health and comfort of the troops. It is now fully understood that since, of all stores and munitions of war, the most expensive as well as the most valuable is the soldier himself, economy of life is the best exercise of frugality. There are indeed satisfactory indications that anxiety for the preservation of life has not become more prevalent in the army itself than in former times. The troops which have been selected for the expedition are probably glad to vary the monotony of peace, and if all the officers employed had suddenly been disabled, there would have been no difficulty in supplying their places ten times over with eager volunteers. The war is a disagreeable accident; but there is at present no reason to regard it in a lugubrious or desponding spirit. Since the check which they first received the Ashantees have ventured on no further attack, although they might have been encouraged by the unfortunate incident on the Prah.

THE TRIAL OF MARSHAL BAZAINE.

AFTER a lapse of nearly three years from the surrender of Metz, the trial of Marshal BAZAINE has at last begun. It is an event of extreme importance, both in the history and the politics of France. From the first day when the news of the surrender reached those who were engaged in organizing the war of defence, the cry of treachery was heard. That an army of upwards of a hundred and fifty thousand men, comprising the flower of the French troops, should have been shut up in a fortress for two months without making any serious attempt to escape was said to be perfectly unaccountable, except on the supposition that the General to whom its destinies had been confided had proved unfaithful to his trust. But, as every French General was immediately accused of treachery as soon as he had undergone a reverse, no great attention was paid outside France to the imputations cast on the honour of Marshal BAZAINE. If it was difficult to account for his inactivity,

it was still more difficult to believe that he had sacrificed his country to any unworthy motives. There was, however, ample ground for making an inquiry into his conduct, apart from any suspicions of his fidelity; and the Government of M. THIERS was acting strictly within the line of its duty when it ordered such an inquiry to be made. A Commission was appointed to receive and report on all the evidence that could be discovered, either in condemnation or defence of the Marshal. The Report at which the Commission arrived is in the highest degree unfavourable to the accused. Marshal BAZAINE is stated, in the first place, to have never made any serious use of the means at his command to get his army away from Metz before the investment began. In the next place, he is accused of having refused to associate himself with the efforts of those who were devoting themselves to carrying on the war, because he preferred to arrange with the enemy a scheme for an Imperial restoration. Lastly, it is alleged that he capitulated on terms needlessly humiliating, and without any thought for the honour of his troops and his country. These are most serious accusations, made as they are after deliberate inquiry, by the mouth of a general officer; and it is obvious that, if the assertion contained in the Report that, had it not been for BAZAINE, Lorraine might still be French, is shown to be justified by satisfactory evidence, the taunt which has recently proceeded so frequently from the lips of Monarchical partisans, that the war was prolonged blindly and without hope, will henceforth lose almost all its sting.

BAZAINE was made Commander-in-Chief on the 12th of August, and in accordance with the views of the EMPEROR and the Imperial Ministry he proceeded to make the necessary arrangements for transporting his army to Châlons in order to cover Paris. He failed, and the causes of his failure are, according to the Report, to be found in his extreme incapacity, and in his having conceived a secret design not to quit Metz at all. As instances of his incapacity, it is stated that he took no adequate measures to transport his army over the Moselle; that, after the battle of the 16th, he failed to push on towards Verdun, because, as he then said, his men were without provisions, whereas he now owns that there were provisions enough if they had been properly distributed; that he sacrificed CANROBERT on the 18th by leaving him without support in presence of superior numbers, and that in the great battle of the 18th he entirely neglected his duty, and scarcely went near the field of battle at all. With regard to these charges of incapacity, it may be remarked that they will be very hard to prove, and that, even if they were established, all that would be shown would be that BAZAINE was about on a level with the other French commanders in the war. The charge of his having all along intended to stay at Metz, and of having purposely deceived the EMPEROR and MACMAHON, and thus led indirectly to the disaster of Sedan, is a much more serious one; but it is not very easy to understand either the precise nature of the design attributed to him, or the means which it is supposed he took to carry it out. The Report seems to suggest that BAZAINE intrigued through his wife for the supreme command, and that then, when he had attained the position he desired, he wished to use it so as to make himself independent alike of the EMPEROR and the Government, and to be able to decide alone as to the mode in which the war should be carried on. The Report also states, in a tone of very positive assertion, that he endeavoured to conceal and carry out this design by withholding necessary information, by ignoring despatches which he received, by treacherously intercepting his own despatches before they reached MACMAHON, and by trying to create a belief, which was totally unfounded in fact, that it was impossible for the bearers of despatches to get to him at Metz. It is true that he obtained in the last days of August the assent of a Council of War which he called together to his resolution to remain for the moment under the shelter of Metz; but it is stated in the Report that he concealed from this Council his knowledge of the important fact that MACMAHON had already started on the dangerous expedition which it was hoped would end in the junction of the two armies. We must own that this part of the Report, apart from the evidence by which it was to be substantiated, is not very convincing; it reads like all French indictments, as if it were drawn on the principle that, if there is good reason for suspecting a man of a crime, the proper thing in order to present the case fairly to a tribunal is to portray him as having been engaged from his earliest years in

a steady career of the blackest villainy. The story of BAZAINE's doings during the month of August seems quite as compatible with the theory that his errors were those of a second-rate man blundering and purposeless in face of extraordinary difficulties, as with the suggestion that he was a dark and mysterious schemer, having selfish purposes of his own, and sacrificing every one in order to attain the end he proposed.

The real gist of the accusation against BAZAINE lies, however, not in what he did before Sedan, but in what he did after Sedan had led to the downfall of the Empire, and to the substitution of a Government which he distrusted and despised. He did not, it is alleged, in any way co-operate with those who were carrying on the war; he gave them no information as to his position, he suggested no general scheme of attack or defence. He remained, in fact, in a state of complete isolation and complete inactivity. For these consequences that thence ensued the Report holds him exclusively and absolutely responsible. It is alleged that, as several examples show, it was perfectly easy to get in and out of Metz; and it is even said that the Marshal might have got now stores of provisions if he would but have condescended to use the aid of the Republican Government in procuring them. The old vexed question as to the possibility of effectual sorties being made is once more raised, and is of course decided against the Marshal. The view of the Report is simply that he did not get out because he wished to stay in; and this brings us to the really important charge which, if proved, will justly subject him to severe punishment and condemn his name to perpetual infamy; but which, if disproved, will render the substantiation of other charges against him comparatively unimportant. The precise accusation against him is, that he purposely deprived France of the services of its one remaining army, in order that, in concert with the enemy, he might make this army the means of crushing the opponents of the Empire, resuscitating the Imperial Government, and thus providing the Germans with the means of readily negotiating the terms of peace. In other words, it is alleged that BAZAINE wished to close a foreign war at the cost of any humiliation, in order that he might carry a civil war to the issue which he fancied would best suit him.

There is no doubt that the mysterious M. REGNIER was, with the concurrence or connivance of the Germans, entrusted by BAZAINE with a mission, the object of which was to learn how far the EMPRESS would countenance some project of negotiating terms independently of the Republican Government, and that the scheme fell through as soon as it was found she would have nothing to do with it. But it must make much difference in the mode in which BAZAINE's conduct is to be regarded whether it is true or false that he had no means of knowing what steps were being taken in other parts of France to prolong the war, and whether he honestly believed an effective sortie to be possible, or whether, with a perfect power of getting out when he pleased, he only pretended to make sorties in order to conceal the treachery he was meditating. It may be suspected that it will be very difficult to establish to the satisfaction of military judges that a successful sortie on a scale sufficient to release the bulk of BAZAINE's army could have been made after the lines of investment had once been formed. Before that date BAZAINE might perhaps have cut his way out with a large sacrifice of men and material; but the truth probably is that both BAZAINE and his army were too much disheartened by finding how great was the numerical superiority of the enemy to be fit for any great effort soon after the exhausting battle of the 18th. After he had given up all hope of success in his negotiations and in his attempts to escape, BAZAINE turned his thoughts to the melancholy necessity of capitulating, and the third head of the charges against him is that which refers to the time and the mode of his capitulation. What is principally urged against him is, that he did not destroy the materials of war in the place, and that, instead of burning the flags, he allowed a large number of them to pass into the hands of the enemy. It is clear from the manner in which the part of the Report dealing with these matters is drawn, that, with regard to the details of the capitulation, a great amount of evidence adverse to the Marshal will be forthcoming; but although, according to the rules of the service, neglect of duty in regard to the terms of capitulation may render a commander liable to

punishment, every one will know that in the great trial of Marshal BAZAINE questions as to his inactivity in August, and his neglect to destroy guns and flags when he was capitulating, are merely subsidiary, and that the real issue to be tried is whether the Marshal left the Republican armies to perish in order that, with the assistance of the foreigner, he might bring home in triumph the dynasty of NAPOLEON.

HOME RULE.

THE revival of the clamour for Repeal, under the name of Home Rule, is likely to be not less troublesome than the original agitation. Mr. BUTT is a less formidable and less crafty demagogue than O'CONNELL; but he has the advantage of living in a generation which is tolerant, through familiarity, of every kind of seditious innovation. Although the Liberal party was, before and after the passing of the Emancipation Act, closely allied with the Irish Catholics, no English candidate thought in those days that his interests would be promoted by an avowal of his readiness to submit to the disruption of the Empire. It is true that before the establishment of household suffrage Irish voters in Dewsbury and other Northern boroughs were few in number; but there is reason to believe that political laxity has become more common in the course of forty years. It was never exactly known whether O'CONNELL was in earnest; and Mr. BUTT's real aspirations are not less doubtful; but English politicians in the days which followed the first Reform Bill never professed to make the existence of the United Kingdom an open question. As one of the rank and file of the Ministerial majority, Serjeant SIMON probably indicates the tendencies of some of his colleagues; and the section of Conservatives which bids for popularity against the Government by adopting the doctrine of household suffrage in counties would not be incapable of applying similar tactics to the agitation for Home Rule. It is difficult to convince factious partisans that narrow cunning is for the most part incompatible, not only with wisdom, but with selfish prudence. When Home Rule becomes a prominent question, there can happily be no doubt of the popular feeling which will prevail in England and Scotland. Mr. BUTT is too sanguine if he believes that the English democracy will sympathize with his demands. If the working class should hereafter acquire the control of national policy, its representatives will not be in a hurry to proclaim that they are less patriotic than their predecessors. In the Northern manufacturing towns the Irish are, with or without fault of their own, not regarded with general favour; and candidates who bid high for their votes will run the risk of alienating the majority. There is indeed no absurder paradox than the proposal of Mr. BUTT and his fellow-agitators that English elections should be decided by Irish voters for the purpose of promoting total or partial separation of the two parts of the kingdom. The constant migration from Ireland to England would alone justify the maintenance of the Union.

The Roman Catholic hierarchy has, for sufficient reasons, hitherto abstained from identifying itself with the movement for Home Rule. At the last general election some bishops and priests gave active, and even scandalous, aid to Repeal candidates; but their motives were apparently accidental or local; and it was not known that they were acting under the direction of any central authority. The fact that the conduct of the agitation has been hitherto entrusted to a Protestant sufficiently proves that it has not yet assumed a clerical character. The most fulsome compliments will never induce bishops and cardinals to repose confidence in a heretic who cannot even affect to admit the validity of their pretensions. The late declaration of the Bishop and clergy of Cloyne seems to imply that the Roman Catholic priests think that it will be more to their interest to adopt the demand for Home Rule than to risk the loss of their popularity. The ambiguous and commonplace letter of Archbishop MACHALE is less significant because the aged prelate has always been a Repealer of the school of O'CONNELL. His national passions and prejudices have always deprived him of the perfect confidence of Rome; and he may probably have resented the preference of a rival who had been trained in Italy for the service of the Holy See. The decision of the hierarchy will remain doubtful until Cardinal Cullen has spoken; but it is scarcely probable that the Bishop of Cloyne would have acted without his sanction. The policy of the

Roman Catholic Church will be determined by a calculation of the chances of the coming election. The Bullot has greatly weakened the power of the clergy; and if it is thought that Home Rule candidates are likely to succeed, it may be thought prudent to anticipate and avoid defeat by conforming beforehand to the opinion of the constituencies. If Cardinal Cullen and those with whom he takes counsel were entirely free agents, they would scarcely plunge into the uncertainty which would result from separation. At present they enjoy both the protection of the Imperial Government and the popularity which is earned by ostensible resistance to English supremacy. In an Irish Republic, which would be the only possible result of Repeal, the clergy might be exposed to the fate of their order in Spain. Modern Irish agitators are more likely to look to America or to revolutionary France for precedents than to acknowledge the paramount claim of the Church to political obedience.

It is possible that the more prudent leaders of the clergy may foresee a double danger in a policy which they nevertheless prefer on a calculation of the balance of expediency. If their alliance were to ensure the success of the movement for Home Rule, the victory might perhaps prove to be suicidal; and, on the other hand, the accession of the clergy to the agitation will render it more than ever unpopular in England, by connecting the demand for separation with claims of ecclesiastical supremacy. The secular agitators already betray uneasiness at the prospect of merging their organization in a new confederation. Mr. Burt asserts that he has always regarded the efforts of the Home Rule Association as preparatory and provisional, and that he gladly accepts the assistance of a revered and national hierarchy. Some of his associates express more candidly their distrust of a body of allies which has never in any part of Catholic Christendom heartily devoted itself to any object unconnected with its own separate aggrandizement. The Repeal party under O'Connell was avowedly Catholic, and the leader was sufficiently powerful to influence the clergy in his turn while he enjoyed their unbounded confidence. Mr. Burt will necessarily be superseded if the bishops obtain the control of the movement, nor will they continue to promote it if their predominance is disputed. One consequence of their adhesion will be the inevitable abandonment of all attempts to effect a compromise with the Irish Protestants. The Orangemen, as well as the more moderate Protestants, have, greatly to their credit, hitherto refused to countenance projects of separation. Their repugnance to Home Rule will become still stronger if they have reason to regard it as a preparation for Roman Catholic supremacy. Mr. Burt's English democracy is much more likely to entertain an exaggerated prejudice against a cause advocated by the priests than to listen to the blandishments of Home Rule agitators. The demagogues are at present in an embarrassing dilemma. Without the aid of the clergy they can scarcely claim to represent popular opinion; and nevertheless they know that the priests dislike them, and profoundly distrust their designs. The two factions which are in unequal degrees hostile to English rule have no other motive or purpose in common.

Proposals to buy off Irish disaffection by petty concessions are as childish as Lord Russell's proposal for the establishment of four little Parliaments in the respective provinces. The Home Rule agitators have used as a plausible argument for their scheme the alleged cost and inconvenience to railway promoters of attending before Committees of Parliament in London. Only the simplest of mankind can believe that they would be in any degree conciliated by the adoption of a project for the consideration of private Bills by Committees of Irish peers and members in Dublin. The expense might perhaps be slightly diminished, while the risk of jobs would be greatly aggravated; but if such an arrangement were really desired by those whom it would practically concern, it would not be worth while to object to the experiment, if it could be tried at a fitter season. In the present state of things it is evident that the institution of a Parliamentary Committee in Ireland would be represented by the demagogues both as the admission of a grievance and as a proof that indigenous legislation was harmless and practicable. It would scarcely be a compliment to Mr. Burt to accept seriously his declarations that simple Repeal, or the establishment of an Irish Parliament for local purposes, would satisfy the wishes of those whom he professes to represent. The numerical force on which he relies for success at the next election consists not of Home Rulers, but of Fenians, who

would be as hostile to the Imperial connexion after the repeal of the Union as before they had a Parliament of their own which might seem to render the existence of a common Legislature superfluous. The independence of Ireland as it existed for only sixteen or seventeen years during the whole course of history ended in a disastrous rebellion. A federal constitution, even if it were endurable in itself, would only stimulate the demand for total disruption. Even if it were possible that separation could be peaceably effected, oppressed parties would soon appeal to England for protection, and not without success. It is much better that the Union should be preserved than that it should be re-established by force.

TENANT-RIGHT FALLACIES.

THE Social Science Association was nearly tempted into a deviation from its proper functions when one of its Sections engaged in a discussion on tenant right. According to the theory of the Association as interpreted by its practice, social science includes only those subjects which are from their nature not susceptible of scientific inquiry; yet some of Mr. Howard's propositions are so demonstrably fallacious that they almost rise to the rank of scientific errors. He is perfectly justified in citing as authorities in support of his opinions the Chambers of Agriculture in which tenant-farmers always form the majority. It would be strange if any class objected to proposals of legislation in its own favour. It might perhaps be possible to extend without violation of the rights of property the security which is in almost all parts of the country afforded to the outgoing tenant by local custom. Unexhausted manures, drains constructed by the occupier and left in working order, and other investments of capital which might be easily enumerated, as they equitably belong to the tenant, ought not to be appropriated without compensation by the owner. The cases in which injustice of this kind is committed are few; and, where a reasonable custom of the country forms a part of the contract between landlord and tenant, sufficient security against wrong is already provided. There are large districts in which the landlord executes the minutest repairs, as well as the more permanent improvements, and where the use of artificial manures is exceptional. Soon after the last general election some farmers in Wales attempted an agitation for fixity of tenure which was certainly not justified by their habits of investing capital in the land. Unless the right to compensation at the determination of tenancies were strictly defined, it would become an instrument of intolerable oppression. None of the speakers at Norwich, except Mr. Heron, who represented the extreme Irish view of tenant right, openly advocated fixity of tenure or a right of compensation for mere disturbance; but the same object would be indirectly attained if a change of tenancy were rendered so burdensome and perilous to the landowner that he would be habitually deterred from exercising his right.

It would be unreasonable as well as discourteous to doubt Mr. Howard's assertion that he demands legislative interference for the public good rather than for the benefit of the tenant, or for the sake of injury or advantage to the landlord; but, in dissociating himself from his natural clients, he infringes the fundamental principles of political economy. It is not the business of Parliament to direct, if it were possible, the application of capital to the improvement of land; and if the experiment were legitimate, Mr. Howard's anticipations seem to be extravagant and chimerical. If, according to Mr. Howard, the whole country were brought up to the standard of a model farm in Norfolk, the produce of meat in Great Britain would amount to 150,000,000*l.* a year. In another calculation Mr. Howard estimates the possible increase of agricultural products at 100,000,000*l.* a year. Large figures are always suspicious; and it is equally impossible to admit or to deny the accuracy of a conjectural estimate, though it is absurd to suppose that by the most unbounded outlay the sands of Surrey or the hills of Wales could be made as fertile as the best soils of the Eastern counties. It is well known that high farming answers best on the richest land; and that consequently an enterprising tenant would, if he had the choice, prefer land worth 4*l.* an acre to ordinary arable or pasture. Mr. Howard himself produces on his farms a net return from the sale of meat of 5*l.* per acre; and it may be presumed that his skill and judgment enable him to farm at a

reasonable profit. On barren soils a similar production would cost much more than it would be worth. To realize Mr. HOWARD's hundred millions a year, it would be necessary to divert from other occupations at least a thousand millions of capital; and it is not self-evident that the transfer would be advantageous either to capitalists or to the community. If twenty per cent. can be made by spinning cotton, and only ten per cent. by putting artificial manures on land, self-interest coincides with public utility in preferring the more abundant return. It must be remembered that Mr. HOWARD's imaginary increase of fertility is to be obtained exclusively by the application of new capital to the land; and it is notorious that the rate of profit decreases as cultivation becomes more and more artificial, and especially as it affects less fertile soils. There can be no doubt that the land might be rendered more productive by the extension of drainage; but in general the process would cost more than 10*l.* per acre, so that the improvement would be unprofitable unless it added at least 10*s.* to the renting value. The author of the Report of the Select Committee of the House of Lords enumerated, with a kind of sarcastic humour, the numerous exceptions to the proposition that drains improve the land. Mr. HOWARD seems to assume that in every case every outlay of capital is both conducive to fertility and adequately remunerative.

To establish the necessity of legislation, it must be proved not that crops or stock might possibly be increased in amount, but that artificial obstacles to profitable cultivation are at present interposed by the law of land tenure. There are a few small districts in Northern Europe where the gross produce of land is greater than in England; but there is no part of the world, which can be fairly compared to England in soil and climate, where the proportion of agricultural produce to the labour employed is nearly as large. The spade will in general produce larger crops than the plough; but on the whole horses are cheaper than men, and steam is, under favourable conditions, cheaper than horses. Mr. HOWARD, who both preaches and practises scientific farming, is not likely to prefer the cottier tenancies of Ireland or of Flanders, or the petty freeholds of France, to the great manufactories of grain and stock which thrive in Norfolk, in Lincolnshire, and in Northumberland; but if he persists in judging of the system of land tenure by the difference between the actual gross produce of the soil and the crops which might possibly be raised, he will find it difficult to resist the revolutionary schemes of Mr. ARCH and his associates. It is necessary to his contention to devise some argument against freedom of contract, and consequently he remarks that applicants for farms are not on equal terms with landowners who possess a monopoly of the soil. The man who wants to hire a farm "has only" "the freedom of refusing the farm of which, after great efforts, he may have succeeded in obtaining the offer, and" "which perhaps a score of his neighbours stand ready to" "take, no matter what may be the conditions imposed, if the" "rent is not too exorbitant." If the usual conditions of tenancy are unjust to the occupier, it is strange that there should be an eager competition for the opportunity of engaging in a losing business. Mr. HOWARD, in fact, underestimates the eagerness to obtain farms in the best districts, as, for instance, in Norfolk, where it is not unusual to have eighty or a hundred applicants for a vacant farm. The struggle proves that there is a valuable property which may be called a monopoly, and which would still be the subject of bargain and sale if the rights of the actual owners were transferred to new possessors or limited by operation of law. Mr. READ, in the course of the discussion, justly denounced "the silly custom of payment for good-will," or of tenant-right as it prevails in Ulster. If tenant-farmers were to receive a gratuitous boon from the Legislature at the expense of their landlords, they would deal with it as with any other kind of property. The concession of Mr. HOWARD's demands, as far as they are reasonable, would produce an insignificant result; but if he proposes to abolish monopoly, or, in other words, landed property, it is not easy to estimate the magnitude or to determine the tendency of the change. It is improbable that Mr. HOWARD's expectation of a great increase of production would be confirmed by the result. Tenant-farmers who support his proposals of legislative interference are more solicitous to enlarge their own interests in the land than to add hundreds of millions on their own risk to the supply of food for the nation. Their enthusiasm for new experiments is not unlikely to be checked by the formidable agitation which has

lately been promoted among their own labourers. Demands for Parliamentary meddling with the relations of capital and labour have caused well-founded alarm. There is not the smallest reason for believing in the existence of the dukes and lords who are supposed to have told Mr. ARCH that they would combine for hostile purposes against the labourers. The farmers have much more to fear from the Unions than from their landlords.

MILK AND COALS.

THERE is an extension of the co-operative principle which has long been urgently required, and which, in the present exasperated temper of the public, has perhaps some chance of being carried out. A co-operative association for the purpose of prosecuting fraudulent tradesmen would evidently have a large field open to it. Numerous Acts of Parliament of all sorts are passed from time to time for the protection of the public; but experience has shown that Acts of Parliament are of very little value, unless the public is ready to employ them in its own defence. The statute-book supplies a fine armoury of weapons; but unfortunately there is seldom anybody willing to make use of them, and so they rust on the rack. It would appear that people must be very ill-used indeed before they will stir a finger on their own behalf; and of course the cheats are encouraged by the impunity with which they are practically enabled to perpetrate their robberies. Just now the public, worried beyond endurance, has fairly turned at bay, and is tossing milkmen and goring coal-dealers in all directions. The fit of revenge is a very wholesome one, but it is to be feared that it will soon exhaust itself. What is wanted is the systematic prosecution of all fraudulent retailers in cold blood from day to day. A great co-operative prosecuting association, with ample funds and a good staff of standing counsel, attorneys, and analysts, would be of service not merely by securing the actual punishment of offenders, but by the general terror which it would inspire. Nothing would be so likely to keep down this sort of knavery as to have always a rogue on the spit for the edification of his fellows.

In the meanwhile we are glad to observe that people are at length being stirred up to take care of themselves. All the depredations of the ordinary criminal classes who pick pockets, break into houses, and steal and rob in other ways, are, measured by money, a mere flea-bite compared with the constant, steady, business-like spoliation practised by fraudulent tradesmen. On Wednesday there were no fewer than seven charges against milk-sellers in the police-courts; and the magistrates inflicted fines varying from 8*s.* to 10*l.* (in each instance with costs) according to the extent of the adulterations. In the worst case the so-called milk contained 80 per cent. of water; in other cases the water was 40, 50, and 67 per cent. of the whole quantity. One of the milk-sellers pleaded, through his solicitor, that the milk was adulterated by his men without his knowledge, that it was adulterated in the country before it came to him, and that it was notorious that pure milk could not be sold for fourpence a quart; but this ingenious variety of pleas did not save him. An official trade circular which has just been issued explains that many milkmen have hitherto been acting on the principle that they could obtain a larger profit "by the dilution or" "abstraction of cream than by charging an advance which" "was sometimes resisted"; and asks the public whether they will "hold out a premium to fraud and dishonesty" "by paying an insufficient price for an article which" "deceives them and disgraces the trade." It might be observed that it is rather difficult to say what is a sufficient price for a deceptive and disgraceful article; but we are more concerned to note the admission that this is the sort of article which has hitherto been sold, and for which the dairy-men now profess to be anxious to substitute genuine milk, if their customers will only agree to the increase of price. As one of them said at a recent meeting, "the public surely" "would not begrudge an extra penny per quart if they got" "good milk in return." The question, however, is not what is a fair price for milk—as to that the dairy-men are clearly entitled to form, and as far as they can to enforce, their own opinion—but whether dairy-men have a right to sell under the name of milk anything which is not milk. The recent Adulteration Act and the prosecutions arising out of it have settled this question, and the dairy-men may be left to seek redress in their own way. As long as they supply real milk, they have a perfect right to

charge their own price for it, and economical housewives who resent the higher price can easily adjust the balance for themselves by watering down the milk to its former level.

There is a significant similarity in the arguments by which the dairymen and the coal-dealers seek to justify their dishonest practices. Their plea is simply this—that, if they cannot afford to sell a genuine article at a particular price, they are entitled to sell anything else that comes to hand in place of the genuine article. The purchaser is supposed to be bound to know what is a fair price for pure milk or real coals, and if he buys anything under that price he has no right to complain, though it should turn out to be water or slates. One of the police-magistrates was weak enough to be misled by this argument, and told a man who complained that what had been sold to him as Wallsend coal was worthless rubbish which would hardly burn at all, that he could not expect to get Wallsend coal at the price he paid, and had no right to redress. The man might have replied that he had at least a right to expect something that would burn, whether Wallsend or not. We are happy to see that other magistrates have steered clear of this dangerous ground. In the first place, it is difficult, and in some cases impossible, for the purchaser who knows nothing professionally about coals to say what is a fair price for a particular quality; and, in the second place, it is not part of the duty of a police-magistrate in these days to fix the price of coal or of anything else. His task is of a more simple nature. He has only to look at the terms of the offer made by the seller, and at the article actually supplied, and to decide how far they agree. This is the common-sense view of the matter which has been taken by Mr. NEWTON in the case of Mr. W. E. BATLEY, of the Newcastle Colliery Owners' Coal Company, Great Portland Street. This gentleman is an advertising coal-dealer, and he has now been advertised as much as he could desire. Mr. BATLEY inserted in the newspapers an announcement that "The Newcastle Colliery Owners are selling their celebrated Wallsend at 28s., which are the best burning coals in the world. Weight and quality guaranteed." Mr. H. BARTLETT, a consulting analyst, bought a ton and a half of these coals on the faith of this advertisement; but his servant complained of them, and on examination he found that they were of very inferior quality. The magistrate therefore ordered Mr. BATLEY to pay a fine of 10*l.* and costs. This is the second fine which Mr. BATLEY has had to pay. In a former case it was pleaded on his behalf that he had done "only what other tradesmen did," but Mr. NEWTON remarked that this had nothing to do with the question, which was simply whether he had sold bad coals for good. He added that from letters and other communications he had ascertained that the defendant had plundered the public for a long time, but he hoped they would now know what remedy they had. If Mr. BATLEY has been doing a good trade in this class of coals, and if many of his customers appeal to Mr. NEWTON, his transactions will hardly turn out very profitable. In a case before Sir R. CARDEN at Guildhall it was shown that Messrs. RICHARD SMITH and Co.—a firm carefully to be distinguished from RICKETT, SMITH and Co.—advertised that "the cheapest coal the world produces is the New Main Wallsend at 30s.; no ash or slates." A City police-constable bought some of them, and stated that there were about six sacks of dust and slag to about four of coal, and that the fuel burned with a slaty white ash. It was acknowledged that the coals were bad, but it was urged that it was not Messrs. SMITH's fault, as the coals were sent from another wharf and they never saw them. Sir R. CARDEN said the advertisement contained a series of falsehoods, and imposed a fine of 5*l.*, or one month's imprisonment.

It cannot be said that in regard to frauds of this class the Legislature has neglected to make proper provision for the protection of the public. Transactions between coal-dealers and their customers are placed under statutory regulations which are quite as minute and specific as those relating to cabs. The carman who delivers the coals is required, before he begins to unload, to give the purchaser a ticket "describing the quantity, and, if any particular sort is ordered or contracted for, the sort, of the coals sent by the seller." He is bound to carry scales and weights, and to weigh coals on the demand of the receiver. If he refuses to do so, or obstructs the weighing, he is liable to a fine not exceeding twenty pounds. It is impossible to

imagine anything more which could be done by legislative enactment to prevent people who buy coals from being cheated by the dealers, short of sending round a Government officer with every cart to compel the householder to put in force the provisions of the law for his own protection. The coal-dealer is bound to render an invoice containing full particulars, which may afterwards be used against him, and he is also bound to satisfy his customers that he is giving good measure. He is liable to a heavy fine if he neglects to send a weighing-machine with each coal-waggon; and if there is any deficiency in quantity or quality the customer can either refuse to receive the coals or seek redress at the police-court. Yet how often is any use made of these regulations? As a rule, the customer is content to send one of his servants to count the empty sacks, and if the number is all right he is satisfied; but it is a common trick among knavish carmen, with or without the connivance of their employers, to bring one or two empty sacks with them which are slipped into the heap when nobody is looking. If people object to be cheated, they should make a rule of always counting the full sacks in the waggon, or having one or two sacks weighed, and of appointing some one to see that the contents of each sack are duly discharged into the coal-cellar. All this of course involves trouble, and there are people silly enough to think that it looks mean; but people who will not take a little trouble on their own account, and who are afraid to be thought mean because they insist upon getting what they have paid for, must just make up their minds to be plundered, and deserve no pity. The same observations apply to the sale of milk. Nothing can be simpler than to measure the quantity supplied by pouring it into a jug of known capacity when it is delivered, nor is there any difficulty in testing the quality of the milk. The addition of water changes not only the taste but the colour of the liquid, and its density also supplies an indication of dilution. Under the Adulteration Act, application can be made to special officers to test the quality of suspected milk; and the magistrates have shown, in the case both of the dairymen and of the coal-dealers, that they are quite ready to deal sharply with all tradesmen who are convicted of fraud. There can be no doubt that the laziness and carelessness of the public are mainly responsible for the large amount of dishonesty which is constantly practised. If people would only make up their minds to insist upon receiving good quality, and fair quantity, and would avail themselves of the means of protection furnished by law, it would lead to a vast saving of money, as well as to an improvement in the standard of commercial morality.

THE CLERGY AND STRIKES.

IT is natural that the clergy, as they have been attacked so bitterly for not espousing the cause of the agricultural labourer against the farmer in the recent strikes, should wish to be heard in their own defence. The Bishop of OXFORD stated the case with great clearness and moderation at the meeting of the Church Congress at Bath. He thinks it rather hard that he should be called an "Episcopal scoundrel," and accused of crimes which "the *Newgate Calendar* cannot equal," merely because he does not see his way to interpose between a farmer and his men when they happen to quarrel about wages. And he gives several obvious reasons why the clergy had better not attempt to arbitrate in these disputes—in the first place, because they have not the requisite knowledge; next, because neither farmers nor labourers have consented to abide by their decision; and, thirdly, because interference of this kind does not lie within the proper functions of the Church. Bishop MACKENZIE holds that in such a case a strict impartiality is the clergyman's wisest, indeed his only, course. The business of the Church, he says, is not to help agricultural labourers to better wages, or farmers to larger profits, but to remind each side that their duties to one another are not bounded by a mere question of so much wages for so much work, and to preach kindness, charity, and the Christian doctrine of mutual dependence and reciprocal obligation. The Bishop frankly acknowledges that the clergy have not always done as much as they should have done in these respects. More systematic efforts should have been made to civilize and elevate the labourer, on the one hand, and, on the other, to teach his social superiors humility and consideration for those below them. Impartial and reasonable people will, we

should think, be disposed to agree with the Bishop in his view of the manner in which the clergy can deal most usefully with these disputes. It is unfortunate that masters and men cannot come to terms without flying into a violent passion with each other, and assuming that there must be wickedness in not looking at the question exactly from their particular point of view. It is obvious, however, that if the clergy were to take to preaching sermons for or against an increase of wages or reduction of the hours of labour, they would only be adding fuel to the flame. On the other hand, if they can only moderate the passions which have been aroused, and impress on each side that the other side has something to say for itself, they may help materially to bring about a satisfactory agreement. The Bishop, however, has not been so fortunate as to please the *Daily Telegraph*. That journal is shocked at this "astonishing conception" of the duty of a Christian Church, and can hardly refrain from "an exclamation of 'absolute horror.'" It denounces the Bishop's remarks as so much idle wind, and feels bound to "say bluntly" that, if a Bishop can say nothing more to the purpose than that farmers and labourers ought to be good Christians, he had better not speak at all. To tell a man to be a good Christian has apparently no meaning for the *Daily Telegraph*; and it may perhaps be conjectured that the demands of Christmas and Good Friday on the conductors of that journal are so exhausting that they have very little Christianity left for the rest of the year. Why, it is asked, do the priesthood of Ireland exercise an immeasurably greater influence than the clergy of England? It is "because the Irish priests are the social and political leaders of the people, and have given their flock all-powerful aid in their battles with the rich and with the Government." The suggestion is certainly instructive. The Roman Catholic priesthood has undoubtedly fostered the tenant's delusion that the land ought to be transferred from his landlord to himself, and they are now taking a prominent part in the Home Rule agitation. The clergy of the Church of England are therefore warned that, unless they are ready to take up a similar position in England, they must expect to sacrifice what little influence they possess. The English clergy would probably reply that they have no ambition to exercise the functions of Socialist firebrands or revolutionary demagogues.

It will be observed that by insinuation, if not openly, the clergy are accused, not so much of taking up a neutral position between the farmers and their men, as of taking sides with the masters. Even Mr. LLEWELYN DAVIES, who read a paper at Bath, asked whether it was possible by any stretch of imagination to conceive of St. JAMES or St. PAUL taking the side of the upper classes against the lower. And then he spoke of the Church having favoured the abolition of slavery and the emancipation of the serfs, and declared that it would be degenerate and disloyal if it were to commit itself to the policy of keeping down the labourer. The suggestion here is, of course, that the agricultural labourers are slaves or serfs, and that the clergy have committed, or seem to be in danger of committing, themselves to the policy of keeping them in slavery. Without discussing the accuracy of this description of the agricultural labourer, it is enough to say that, as far as we have heard, there is no ground for the charge that the clergy have placed themselves either on one side or the other. Some of them have indeed been tempted to blame the personal malice and inflammatory violence with which professional agents of the Unions have conducted their agitation, and have hinted to the labourers that they might perhaps find better friends nearer home; but it is absurd, or something worse, to try to twist this into hostility to working-men. As to the general question, it is undoubtedly sound policy for the clergy to hold aloof from quarrels between farmers and farm-labourers as to wages, not merely because they are not very well qualified to express an opinion, and because there is no reason to suppose that their decision would be respected on either side, but because intervention in this particular series of disputes would at once land them in a bottomless pit of personal and social controversy. It happens that the farmers and agricultural labourers are not the only classes who differ from each other as to what is a fair price for a day's work. There are similar disputes in every other industry in the country. The miners and the coal-owners, the engineers and their employers, the operative builders and the master-builders, and, in short, every class of labourers and artisans and every class of employers are engaged in close and vigorous con-

flikt as to their respective shares in the division of profits. The shopkeepers and their customers are also at war in the same way, and so are the farmers and landlords. The clergy are not stationed exclusively in purely agricultural districts; and even in agricultural districts there are not only labourers and farmers, but farmers and landlords. A clergyman, therefore, who assumed, under the advice of the *Daily Telegraph*, to abandon what that journal calls the vague and idle generalities of the Christian religion, and to offer a specific judgment on the questions at issue between farmers and labourers, would very soon find that he had plunged into an interminable series of disputes. First, he would have to shut himself up for a week or two, in order, with the aid of competent assessors on either side, to settle the claims of the labourers against the farmers. He would next find a deputation of farmers waiting in his parlour to request him to consider their grievances against the landlords of the parish; or perhaps the landlords might have anticipated the farmers in seeking his assistance from the pulpit in reconciling their tenants to a general advance in rent. If he happened to be in a mining district, the pitmen would invoke his aid against the coal-owners, and the coal-owners against the pitmen, while possibly a body of householders would call on him in order to point out that it was his duty to preach against both pitmen and owners, and in favour of cheaper fuel. If there were no mines, there would probably be factories, or some other manufacturing establishments, in the neighbourhood, and here again he would have another set of economical nuts to crack. Even in the smallest villages there are some shops, and shopkeepers and their customers are constantly divided in just the same way as farmer and labourer. Everybody, in fact, is anxious to get as much and to give as little as possible; and a clergyman would have enough to do who undertook to determine authoritatively from the pulpit, on successive Sundays, how much every class of the population had a right to claim in the shape of wages; what should be the ratio between farm profits and labourers' wages on the one hand and rental on the other; whether pitmen should be more highly paid because they were scarce, and bricklayers and carpenters because there were too many of them; what was a fair price for bread, meat, and groceries, and so on. A clerical student who aspired to qualify himself seriously for the discharge of these functions would have to discard theology for political economy; though it is doubtful whether political economy would altogether suit his purpose if he had no other object than to extend his influence with the multitude by echoing their cries and assuring them that they were ill-used and oppressed, and that if they were poor it was only because they were kept out of their rights. The Irish Roman Catholic clergy, whom the *Daily Telegraph* admires so much, get on very well apparently without political economy.

The position of the clergyman of the future will certainly not be a very enviable one if the views which are now prevalent in certain quarters have any chance of being realized. He is expected to be the leading demagogue and principal Trade Unionist agitator of his parish; but, on the other hand, his clerical work will be chiefly done for him by other people. As his pulpit will be open to all and sundry, he will have little opportunity for preaching himself, even if he happens to have any leisure for the enunciation of the "vague principles" of mere Christianity. While, however, all the other occupants of his pulpit will be able to preach what they like, without restriction, his own sermons will be jealously scrutinized by the agents of rival Church Associations, and it will be difficult for him to escape being prosecuted on one side or the other. He will be entertained by the howling of Slakers and the gorgeous rites of the Roman Catholic Church in the churchyard; and his spare moments will have to be devoted to marrying deceased wives' sisters to their lonely brothers-in-law, or amorous uncles to the tender nieces of their lamented wives. At harvest-home a torch-light procession of discontented labourers, led by the parish clergyman waving a flaming brand, will be a curious but appropriate symbol of the times. All this might indeed be described as an astonishing conception of the duties and obligations of clergymen of the Church of England, and might well draw from that unhappy body of men "an exclamation of absolute horror."

THE MODESTY OF GENIUS.

THERE are some little cut-and-dried taunts which lie ready to the hands of controversialists, as cannon-balls are piled upon the ramparts of a fort, to be used irrespectively of their propriety in any given case. Such, for example, is the doctrine that all bullies are cowards. There is no reason for supposing this to be true; some very brave men have bragged intolerably of their prowess, and been tyrannical on the strength of their boasts. But then it is very pleasant when bullying does turn out to be associated with cowardice; and perhaps mankind have a right to suppress so offensive a custom by assuming, without too rigid an inquiry into the facts, that the association is invariable. A similar doctrine is the plausible commonplace about the credulity of sceptics. It is of course true that disbelief of some of our favourite tenets will very frequently accompany the acceptance of some which we decline to accept; and if everybody is sceptical who hesitates to swallow our dogmas whole, and everybody credulous whose dogmas we cannot swallow, credulity and scepticism will constantly go together. But we fear that it cannot be denied that there are a good many people into whose minds any belief on any subject can only be forced by downright violence; and whose rounded and complete scepticism affords no leverage for this comfortable taunt. Another theory of the same class is the supposed modesty of genius. The convenience of this doctrine, if it were well founded, would be undeniable. There is nothing so pleasant to some people as dashing the vanity of their neighbours. It is comfortable to assume that the very fact that a man thinks himself a genius amounts to a demonstrative proof that he is not; for if that doctrine were once well established, our drawing-rooms and parlours would be swept clear of one of the most annoying varieties of civilized human being. It would indeed be satisfactory to have a conclusive reply to the demand for social blackmail incessantly put forward by persons hungrier and thirsting after adulation. Moreover, we have a more amiable motive for wishing the doctrine to be true. There can be no doubt that modesty, if not a condition of genius, at least adds to it an inimitable grace. A man who is really a first-rate authority gains our hearts most rapidly by genuine unwillingness to stand upon his dignity. Few men are free enough from snobishness to resist the flattery of a king who condescends to meet them on equal terms; and it is an even more delicate piece of flattery when a thinker, honoured throughout Europe, condescends to take your opinion as worthy of comparison with his own. The charm, indeed, is so great that we naturally try to attribute it to the great men of old. We contrive to give ourselves a kind of hypothetical flattery by fancying Shakspeare indulging in the give-and-take of ordinary conversation with men in no degree better than ourselves, and perfectly unconscious of his own rightful supremacy. It raises us in our own opinion to think that, if we had lived two or three hundred years ago, we might have been freely admitted to so high a privilege. Now, as the biographers and critics of men of first-rate genius have been generally given to excessive admiration, this grace which ought to have been characteristic, has therefore been represented as actually characteristic, of all the greatest men in the world. The portraits having really been coloured by this belief, they are, according to our ordinary logic, adduced as a conclusive proof that the belief must be a sound one; and moralists have ventured to lay down as a general principle the doctrine that true genius is free from self-consciousness.

If we endeavour to test the doctrine by facts, however, we are very soon brought into difficulty. We may say that modesty, so far as it refers to an intellectual condition, means that a man's estimate of his own talents is not excessive. In this respect the man of genius certainly differs widely from his inferiors. There are, we should say at a random guess, at least a dozen systems of universal philosophy propounded every year with the utmost gravity by men who have really learnt nothing but the art of using long words. The authors are just as pretentious as Hegel or Comte, and fancy that they have found the one key to the everlasting enigma. In nearly all these cases we should be inclined to say that a man's vanity was preposterous, except in so far as his utter ignorance might conceal from him the true nature of his pretensions. In one case, however, in a century, the philosopher, though he has not solved everything, has revolutionized the whole system of thought. If so, we do not call him vain; we simply admire his justifiable self-confidence. The ninety-nine humbugs grossly over-estimated their powers, whereas he was really as great a man, or nearly as great a man, as he supposed. The fact is undeniable; but the argument is not really conclusive. Conceit does not really depend on the relation between a man's true value and his estimate of his value. If so, it would be scarcely possible for some great men to be conceited at all. If Shakspeare, for example, had guessed only one half of the truth about himself, if he had known that the minutest details of his life and writings were to be discussed in all civilized languages, that his influence would revolutionize foreign literatures centuries after his death, and that Ben Jonson and Fletcher would appear to his posterity as mere pignions by his side, he would have been thrown off his balance by sheer astonishment. Such increase would have been too strong for any mortal brain. And in this sense it is almost impossible for any man of genius to be conceited. Nobody, however brilliant his promise, can be confident that he will draw one of the stupendous prizes in the vast lottery of life. A young man who should say, I will be a Shakspeare or a Dante or a Homer, would either be, or be in the way of becoming, a

fool. Genius must so far be unconscious that it can scarcely dare to recognize its own superlative merit, and yet a man may conceivably be overpowered even by a revelation of only a part of his own glory.

In another sense genius must be necessarily more or less unconscious. Newton is supposed to have said that his mathematical excellence was due to nothing but to his having laboured more perseveringly than others. And the theory has been packed into a formula that genius is nothing but an infinite capacity for taking trouble. In spite of the great names which may be adduced in behalf of this doctrine, we venture to think that the source of the fallacy is transparent. We will not dwell upon the fact, which is sufficiently obvious, that a capacity for endurance is just as rare and valuable an endowment as a capacity for immediate insight; and that a man, for example, who can keep his mind fixed upon a mathematical problem for many hours together, as Newton is said to have done, has one of the rarest of powers. But the argument is more vitally defective. Newton saw that, by allowing his mind to dwell upon certain problems, they gradually became clear to him, and that the longer he could attend to them the clearer his mind became. In other words, since his success in mathematical operations varied as the amount of labour bestowed upon them, he assumed that the labour was the one essential element of success. But obviously it does not follow that the same amount of labour from a feeble brain would produce equal effects. The length of time during which a problem was exposed to the action of his intellectual digestion was one condition of his success; but so was the vigour of the digestion for a given time. In short, Newton could compare his own mental operations, and pronounce those to have been most fruitful which were most laborious; but he could not look into the mind of another man, and see by comparison how slow and blundering was his reasoning machinery in comparison with his own. We are all liable to make mistakes of this kind, in one way or the other. We fancy that a man of genius has accomplished success by a lucky hit, because we cannot at all realize the facility with which he can at a given moment command all the resources of his mind. And, in revenge, the man of genius attributes to obstinacy or idleness what is the result of good, plain, honest stupidity. Each of us can only have direct experience of the working of one mind; and we naturally assume, till the contrary has been forced upon us, that all other minds are cast in the same mould. Perhaps it would be as well if, for a brief period of his life, everybody was condemned to be a schoolmaster or a grammar, in order that he might more or less fathom the stupendous abysses of human stupidity. Meanwhile it is easy to understand how a Newton or a Pascal, to whom propositions ordinarily reached by long processes of calculation appear to be self-evident truths, may be unconscious of the difference between himself and his fellows. It does not occur to them that men can be so blind as not to see in broad daylight, and it is easy to imagine that they are wilfully closing their eyes.

Misconceptions, however, of this kind, though perhaps favourable to humility, are certainly compatible even with extravagant vanity. The estimate which we form of our own talents has but an indirect relation to what is really a question of character. A man may be intolerably conceited on the strength of a quality which, even on his own showing, is a trifle. We have known a clergyman, otherwise of apostolic humility, who could not conceal his appreciation of a leg admirably adapted for episcopal costume. Of course he would not have seriously maintained the proposition that good legs give a man a claim to unusual respect, or even to ecclesiastical preferment; but yet his consciousness of their fair proportions enabled him to enter society and even to express opinions on facts, say of dogmatic theology, to which legs have no distinct relation. Perhaps his legs were even more beautiful than he supposed; but that did not justify the extreme complacency which their contemplation imparted to his reflections even upon different topics. If a man's head may be turned by such a trifle, it is not surprising that even a moderate estimate of his intellectual excellence may have a similar effect. A man's poetry may be better than he thinks it; and yet his opinion of it may make him more presumptuous than a knowledge of the truth would justify. A millionaire who only knows of half his own fortune may still be presumptuous. That men of genius are in fact frequently self-conscious does not require proof so much as it would require to be proved that some such men can still escape self-consciousness; and the excuse that they do not exaggerate their own merit is really irrelevant. It would be more judicious to point out in such cases that vanity within certain limits is really an almost essential quality. A disposition at least which for all practical purposes is undistinguishable from vanity is a necessary stimulus to a youth who would do anything great. No young man, for example, however remarkable his talent, could ever have been justified in cold blood "in taking all knowledge to be his province." The chances of a complete failure were so much greater than the chances of even modified success, that a very exuberant confidence in his own powers was implied in the undertaking. A man must be vain enough, according to the old metaphor, to aim at the moon in order that he may get to the top of the tree. In the more active walks of life, it is true, most people have their vanity pretty well knocked out of them. They learn in a few years, and at the price of a good many failures, what it is that they can really do; and then, unless they are fools, they plan their undertakings upon a reasonable estimate of their own abilities. But there are other spheres of activity in which the comforting

influence of a good cheerful vanity is required almost to the end of life. A poet, for example, of original talent may fail to obtain recognition from the older generation brought up under different traditions. The test of his success must be an inward consciousness of merit; and in order to keep up his spirits, it is highly desirable that the consciousness should be somewhat in excess. The process of piping to people who obstinately refuse to dance is so discouraging, that vanity is as necessary a provision to keep up the internal warmth as a supply of oil in the Arctic regions to keep up warmth of a different kind. The oil is not a very nice thing in itself, nor is an unctuous self-satisfaction; but it would be ungrateful to deny that it has its uses.

The dogma, indeed, which we have been considering may be interpreted into a very sound meaning. Every man's eyes should be fixed rather upon his work than upon the reflex results to himself. To take a good aim you should look at the target, instead of being absorbed in the contemplation of your rifle; and a poet or philosopher should rather think of moving his audience than of the verbal apparatus by which he brings himself into communication with them. Yet even so there are intervening moments at which all but the very strongest of men will inevitably think of their own merits, and of the external testimonies to their success. In such moments they will bless the inventor of vanity, as Sancho blessed the inventor of sleep. Whatever be the true moral, the fact can hardly be doubted. Without producing instances, anybody may satisfy himself that a very large number of eminent men have been vain in spite of all aphorisms to the contrary; and if we exempt the greatest names, it is not so much that they are free from the charge as that our hyperboles surpass anything which the most brazen-faced of mankind could utter about himself, whatever might have been his private opinion of his own merits.

TABLES-D'HÔTE AT HOME AND ABROAD.

AS foreigners have been forced to borrow the French word to express the thing, so, do what they will, the table-d'hôte will remain to the end a French institution. It is only by imitation bordering on the servile that more Southern nations have succeeded in acclimatizing it, and we English try to fashion it to a model of our own, and signally fail in consequence. Belgium and the French-speaking Cantons of Switzerland are as much French provinces in their social and gastronomic aspects as Dauphiny or Brittany. *Mutatis mutandis*, with changes in the viands and the wines following the climate and the constituents of the national cookery, it is the Italians perhaps who tread most closely on the heels of their masters. They have plenty to say for themselves, but their talk rather tends to flow in periods when it does not rise into absolute oratory; and it is needless to observe how fatal is elaborate speech to the easy enjoyment of dishes that spoil with the keeping. Slowness and solemnity are still more the vices of the dignified Spaniard, and Castilian stateliness of deportment would be even more misplaced than it is were Spanish dinners better worth eating than they are. But the *puchero* is the only Spanish dish worth dallying with, and the *puchero* keeps its heat for ever, and will wait the leisure of the most long-winded of hidalgos. As for the other dishes, the more you distract your thoughts from them the better; and it is impossible to fire your fancy or set your spirits on the flow by imbibing wines that smack strongly of the pipekin. The Austrians have no tables-d'hôte at all, although, with that light-hearted, good-humoured sociability of theirs, they would perhaps take to them more kindly than many of their neighbours. The *menus* of the Northern Germans are not amiss, although they set rather towards the indigestible, and jumble fruits and pickles and vegetables as if their arrangements had been presided over by the physicians of the various watering-places. But the Germans are essentially a heavy people, even if they did not sit down to dinner when many of us are thinking of breakfast, and at an hour when the labours of the day are still weighing on their consciences. As for the Dutch, they are but Low-Germans, solid to stolidity, born and bred in an atmosphere which is as anti-pathetical to gaiety as it is stimulating to appetite. They betake themselves to their knives and forks with the dogged perseverance with which they have embanked their country and developed its commerce; they act at table on that golden rule of minding one thing at a time which has laid the foundations of their national prosperity; they stow their food away in earnest silence, and postpone their talk till they settle to their tobacco.

Tables-d'hôte at Paris and at Amsterdam are removed far as the poles asunder; and when we refer to those of the former city, we speak of courses of the genuine French dinners that are spread somewhere to the north of the Boulevards or to the south of the Seine, not of the heterogeneous collections of customers who take their meals in company in *casseroles* in the foreign quarter. At the French table-d'hôte everything conspires to assure its success. The people have mastered the art of cookery, and are conscious that they are forced to dine in company. In its simplest shape their dinner has its succession of courses, *hors-d'œuvre* and soup, fish and entrées, rôti, salad, entremets, and dessert. Disposing of it is a work of time and attended by many pauses. The most reserved and phlegmatic of mortals feel a certain awkwardness in sitting out these interludes in silence, and betray it by certain unmistakable signs. To a Frenchman at a Frenchman

this sense of embarrassment would be insupportable, nor can there be any reason why they should submit to it. A thousand nothings are rising to their lips, and they know that their neighbours are ready to listen to their babble. There is no need to do anything so violent as break the ice; they may glide easily over it by the help of the salt-cellar or anything else that is ready to their hand. The very facility with which advances are made and met prevents any advantage being taken of them, and the feeling that no further intimacy is implied enables you to be comparatively free and unreserved in your communications. As every one, no matter what his or her station, can talk more or less, as it is a natural gift and instinct which they have been developing ever since they began to prattle, every one contributes his quota to the general gaiety. In England and most other countries, if you are wise you study your neighbour's countenance before you venture a remark on the weather. There are several contingencies that are worth the weighing; he may consider the remark a liberty and snub you accordingly; he may take advantage of your affability to be vulgarly familiar; or, what is more probable still, it may be more trouble drawing him out than it is worth. None of these things need go for much in your calculations in France, least of all the last one. Thanks to the French being lighter in their natures than we are, almost all of them can meet on the common ground of amusements or frivolities. It may be an abuse of language to speak of a Frenchwoman's toilet as being either frivolous or more matter of amusement; but, class the art of dressing as you will, that is always a safe and fertile theme. An acquaintance of half-a-dozen sentences, if you are deferential in the manner of your approaches, will justify you in freely criticizing the taste of the ladies of the party to the one who happens to be seated by your side; if you find something to abuse judiciously about the best dressed woman at the table, you are sure to win the good graces of your companion for the hour. Then there is the never-failing resource of the stage. Were you to broach the stage as a subject at a table-d'hôte at Liverpool or Glasgow, the subject would drop stillborn at once. One-third of the nation does not approve of it; another third does not appreciate it; and no one in the country knows anything of the latest bit that has been made in town or cares for the last revival of Shakspeare. When a piece has been lunched successfully on the Parisian boards it makes a furore all over the country. It has either been represented in the provincial towns or else it is advertised to be; and people are longing to see and willing to talk about what they have heard so much of.

From such safe topics as toilets or stage plays you can feel your way to more delicate and profitable ones, if your friends show signs of possessing any special information. For although Frenchmen leave the shop or the counting-house outside the door of the salon when they come to dine in mixed company, yet very few of them are above their callings. Should you fancy that the gentleman seated near you at Bordeaux looks like a *commis voyageur* in the trade, and show yourself interested in wines and curious in vintages, he will not be slow to confess his connexions, and will be proud to enlighten you with his superior knowledge. Perhaps that class of *commis voyageurs* illustrates as well as any other the adaptability that makes a French table-d'hôte so agreeable. As a rule, they are perhaps more objectionable than their English counterparts; they must be pushing men to succeed with their employers; they pay in audacity wherever they go, and a vulgar pushing Frenchman is the most vulgar of created beings. Should you be unlucky enough to find yourself in a party of these gentlemen in some provincial inn of which they are the patrons, you will be inclined for the moment to modify your views about French tables-d'hôte, although you will have no reason to complain of an absence of ease and familiarity. But if one of these very men drops into a circle of strangers, ten to one there will be little about him to take exception to, except the loudness of his necktie and his manner of swallowing his soup. So you may take the bagman's counterpart in the other sex; a provincial *modiste* on her way home with patterns from Paris. She sometimes assumes the airs and graces of her most profitable clients, but perhaps she scarcely caricatures the most eccentric of them; and if you treat her frankly for what she pretends to be, her suavity and condescension leave nothing to complain of. In the dressmaker and the commercial gentleman we have selected the extreme types we should most shrink from in England, and you must be unlucky indeed if you are not more fortunate in your company. If the party is not very numerous, and should the conversation chance to have become general, you will find it has grown strangely confidential. As people warm into animation they forget some of the restraints which prudence imposes at first even on a free-spoken French party. The smiles that light up their faces become natural instead of artificial as they really set themselves to please in earnest in place of offering conventional contributions. The man who has made some happy hit which has been approved as good, feels that he has made a reputation for brilliancy which he is bound to sustain; and the others are not to be outdone if they can help it. The ladies try to shine of course, and as they grow conscious of the impression made by their charms, conversational or other, they lay themselves out to be captivating. It is possible the guests may linger at the table even after they have sipped their coffee. They only exchange bows when they separate, yet they bow to each other like old friends, and some impulsive members of the company may have requested permission to serve the hands of others. As nothing is perfect, it is possible that they may have "talked jealous" as the saying drew on, and they were heated by excitement. Some of

them may have become noisier than good manners would permit, and the struggle for the pre-eminence may have overtaken even French politeness. But when you rose to go you were surprised to find the time had passed so quickly, and you went about your business or your pleasure on the best of terms with yourself and the friends you had left.

You may travel through the British islands like the Wandering Jew before you happen upon a dinner party like that. There are tables-d'hôte at watering-places where the guests crumple themselves up in the smallest and straitest seats, and scowl forbiddingly at the knots formed by their neighbours. There are tables-d'hôte in some of the great tourist hotels which answer more entirely to foreign ones, inasmuch as the company is always changing. You may take as a specimen of the latter a dinner on the "Sabbath" on some Scottish tour in the Highlands. The host specially requests you to join it, inasmuch as it spares his servants labour. The prayer is very much of a command, as you find out should you try to insist upon a dinner apart. As far as the food goes, you have no cause to complain of the arrangements at the public table—hodge-podge and cocky-leckie, superb salmon, beef in rounds and sirloins, mutton in haunches and saddles, haggis and sheep's head, poultry, pies, puddings, cheese, and all the rest of it. But the very profusion and the manner of serving it are fatal to geniality. All is brought up in batches and placed on the table to be cut up and distributed. The worst carvers are the most good-natured or officious. How can a gourmand talk pleasantly while he sees the salmon mangled before his eyes, and the fowls torn ruthlessly limb from limb: when he is fobbed off with a hunch of mutton gashed across the grain, while the pope's eye lies on the plate of the unappreciative maiden who is next to him? Constant anxiety of this kind is fatal of course to conversation; even if it were not, you would find it hard to begin to be agreeable. Save for the clatter of knives and plates, a Sabbath stillness reigns in the apartment; and no one is saying anything to anybody else, except some family groups who are softly whispering. The gentleman who breaks out with a solemn "I'll trouble ye, sir, for another spoonful of that haggis," is observed to blush and tremble at the sound of his own voice, although he seems by no means exceedingly impressionable. You steal a glance at the silent guest on your right; he is making the round of all the dishes at a hand gallop, and has no time to spare for social amenities. On your left is a young lady in a green tartan frock, with no collar, who blushes up to the roots of the hair when a waiter accosts her over her shoulder. Full in front of you is a stately dame, whose bangle-covered cap nods like a horse's plume. You fancy she may be cheery enough at home, for her face is pleasant, though red; but she has evidently a rooted suspicion of strangers, and her good-humoured eyes become stern when she intercepts a look of yours at her gawky daughter. Up and down the sides of the long table are stray people with whom you might possibly get on could you pick out a party to adjourn with. But they are all separated, and strongly guarded, like so many prisoners confined on the silent system under the surveillance of unsympathetic turnkeys. This is a fair sample of a British table-d'hôte, nor are matters likely to mend speedily. For it is the pleasantest people who find them most intolerable, and who prefer their own society and a solitary repast to the feast that is spread in such dismal company.

THE ROMANIZING OF INDIA.

LET not earnest Protestants be alarmed. We use the term "Romanizing" in no theological sense, but as denoting a matter of pure worldly interest, and yet of very high importance. We mean the use of the Roman alphabet in India in place of the many varieties of alphabets in use among the natives. Our attention has been forcibly attracted to this subject by the publication of Professor Williams's Sanskrit Dictionary, which, by the free, but not exclusive, use of the Roman alphabet, appears in one stout quarto instead of the three or four which would have been required had the native characters been used for all the Sanskrit words. We have one portable and thoroughly intelligible volume, instead of a cumbrous and far more expensive dictionary in three or four volumes. Labour and expense are economized, and the result is a more practically useful book.

This subject was started in India nearly forty years ago by Sir Charles Trevelyan, and although the value of the proposal was acknowledged by many, it had to contend with old-standing prejudices, and made little progress. Again Sir Charles stirred the question in England some thirteen or fourteen years ago, and for a time it attracted a share of public attention; but, beyond the printing of a Hindustani Grammar and some other books in the Roman character, no success was attained. Nor was it likely to be otherwise, for this latter movement began at the wrong end. It is the native Indian who must be taught and induced to use the Roman character. Masters as we are of India, we are in one respect at least the subjects of our subjects. So long as they speak divers languages and use divers alphabets, we must, if we aspire to rule and hope to administer justice, not only learn to speak those languages, but to read and write them in the characters which the natives themselves employ.

The languages of India are about twenty in number, and the number of alphabets is about the same, although some languages have more than one alphabet; thus the Mahratti has two, and the Hindi also has distinct printed and written forms. With two exceptions, that of the Tamil in the South and the Hindustani in

the North, all these alphabets are only modifications of one type. They are varieties of the Nāgari, or rather of the different forms of the Nāgari in which Sanskrit has been written in different ages. Inscriptions enable us to trace the various forms of the Nāgari in a succession of centuries, and to ascertain pretty nearly the period when the various local languages borrowed their alphabets, and as it were stereotyped their forms. The most remote age to which the alphabet is traceable is that of the Rock Inscriptions, some three or four centuries B.C.; and these inscriptions are considered to afford convincing evidence that the system was no indigenous Indian production, but that it was based upon the alphabet of the Phœnicians. To the best of our knowledge, then, India borrowed her primary alphabet, the foundation of all the rest. Now of all this score of alphabets developed from one original form, and based upon the same system, no two are so alike that they can be read the one for the other. Some approach each other very nearly, but still they are not intelligible without more or less study. It is as if Italian, French, and Spanish were, like the German, all written in different and very divergent varieties of the same alphabet. What a bar would this present to the interchange of thought and the spread of knowledge in Europe, and how still more formidable is the obstruction presented by the diversity of alphabets in India! All the Indian languages have hundreds and thousands of words in common, and yet, these being veiled in unknown characters, it is only here and there that a man possessed of an inquiring mind or placed in exceptional circumstances realizes the similarity and perceives how closely the languages and their speakers are allied to each other.

The Nāgari alphabet is not to be altogether despised; it was based upon a system which has been carefully worked out. But its starting point was wrong. It made the consonants the leading letters, and looked upon the vowels as mere modifying appendages. So the very sounds which give life and tone to language were generally reduced to superscribed or subscribed additions. This degradation of the vowels gave rise to a great difficulty at starting. No consonant could be pronounced without a vowel, so the difficulty was got over by assuming that every consonant had an inherent vowel sound, that of the primary vowel *a* (identical in sound with the *a* in *servant*). But two, and sometimes three, consonants may combine without any interposing vowel, as in the word *strong*. In such words the supposed inherent vowel had to be got rid of, and to effect this the consonants were either broken up and combined in more or less intricate compound characters, or a special mark was suffixed to consonants deprived of vowel sounds. So that in *strong* the *str* and the *ng* were either formed into compounds, or the *s* and *t* had a subscribed mark to show that they were without vowel sounds. The Sanskrit preferred the compounding system, and so large numbers of compound letters were produced, to the great trouble and discouragement of learners. The modern languages admit some compounds, but in theory prefer the devocalizing suffix. But as in ordinary practice this mark is very rarely written, great numbers of words are left of doubtful pronunciation. How immeasurably superior is a system in which every letter, vowel or consonant, is distinctly written! None of the Indian alphabets have any capitals, so that they make no distinction between such words as *Brown* and *brown*, *Bath* and *bath*, although they require to do so much more frequently than is the case in our own language. Though they abound with compound terms, they have no mark like the hyphen—a mark which would be invaluable to learners, as it would enable them to dissect intricate compounds, and would show the true interpretation of such combinations as Sanskrit *sutapa*, which may be read with widely different meanings, as *sula-pa* or *sula-pa*. Again, they have no stops; and although these marks are not quite so requisite in Indian languages as in our own, the absence of them and of capital letters often involves great waste of time and trials of patience in searching for passages required. And to all these defects may be added the fact that the best of these alphabets is far less distinct and legible than the Roman. Take a piece of paper and cover either the upper or lower half of a line of Roman print, still little difficulty will be felt in reading it. But try the same experiment with any Indian alphabet, and failure will be the result. And the reason is, that in the Roman alphabets all the vowels are distinct letters, not mere external appendages as they frequently appear in the Indian languages. The Roman has also the advantage of a greater variety and dissimilarity in the elementary forms of the letters. Lastly, there is the great question of labour and expense. The Roman character can be written at least twice as fast as the best Indian alphabet; page for page it is less expensive to print, and the matter of two or three pages of print in a native character may be brought into one in the Roman character, and yet be equally—nay, more—intelligible. With all these manifest and decided advantages, it does seem strange that the use of the Roman alphabet has not made greater progress.

But before looking at the question from the Indian side, one or two objections raised by Englishmen may be noticed. First comes the allegation that men who can read and thoroughly understand a language in its own letters are unable to do the same when it is presented in Roman letters. Granted. But why is this? Because these men have never taken the very little trouble required to master the system of orthography. Instead of ascertaining the sound which each letter is intended to represent, they assume that they already know it; and so several men may read the same passage in a way neither intelligible to themselves nor to any one else. It is obvious that a fixed regular system must be

adopted, and those who refuse to understand this system are really incapacitated for arguing about it. But it may be said, as it often has been said, "If you must write it in Roman letters, write it as any ordinary Englishman would." This demand is frequently made with all the assurance of its being decisive and unanswerable. But let ten ordinary Englishmen transcribe a passage, each according to his own notions, and the great probability is that no one of the ten will be able to understand any version but his own, and most certainly there will be no unanimous agreement in the accuracy of any one. Those only who have had experience of the unassisted efforts of ordinary Englishmen in transcribing Indian words can form any idea of the perverted ingenuity which has been exhibited. Cases might be quoted of simple words spelt in ten or twelve different ways, many of them as barbarous as the spelling of the alderman who, by writing "kawphy," managed to represent the word "coffee" without using one correct letter. The causes of this variety we shall presently notice.

Another objection alleged is that a change to the Roman system would be destructive of etymology. This, however, has never been proved, and we venture to assert that, so far from destroying etymology, it would have the effect of giving it greater prominence and effect. How strongly might etymology be brought out in books of instruction by the use of varieties of type and of hyphens, and how clearly by these means might the radical be distinguished from its inflectional terminations, its prefixes and suffixes, and its augments. And if this is true as regards the inflected languages of the Aryan stock, it applies equally, and perhaps even more forcibly, to the Semitic languages, in which the radical letters are shifted about by the weaving in of servile letters. Would not a great advantage result from tracing the root through such varieties as the Arabic *malaka*, *mālik*, *namlūk*, *amlūk*, *malik*, *malak*, *malak*, *mulk*, *milk*, *milkāt*, *mamlūk*, &c.? Would it not also be a real gain to have the various vowels represented by distinct letters, instead of by a variety of points, which are often knocked out or shifted by accident, and quite as often omitted or misplaced through inadvertence or ignorance? The difficulty of securing the proper representation of the vowel and other points is so great that they are generally omitted. Hence ability to supply the points accurately is a severe test of scholarship. But were the language written, as it might be, in the Roman character, in a full and distinct manner, no such difficulty would exist, and knowledge would be acquired more speedily and more accurately.

The objections of the natives of India to the introduction of a new system may be readily felt and acknowledged. It is not likely that men who have been educated and have grown up in the use of a particular alphabet will willingly and readily adopt another. But what has occurred once may occur again. It matters little where the original Indian alphabet came from, for it was introduced too long ago to affect the argument; and the most modern forms of the Indian alphabets may well claim to be called old in comparison with our own. But when the Mahomedans conquered India they brought with them their Arabic alphabet; and this alphabet, a most imperfect and unsuitable one, has been made, by dint of many shifts and contrivances, the medium of writing the Hindustani language. A Semitic alphabet has been adapted to an Aryan tongue; for although a vast number of Arabic words have been imported into Hindustani, the language is still essentially Aryan. Here, then, we find an alphabet foreign in its origin and foreign in its relations establishing itself in India, and obtaining currency among millions of people, to express a language for which it is peculiarly unfitted. History tells us of no force having been used, of no law having been promulgated for its introduction, and yet there it is in regular and general use. How then can it be argued that the introduction of the far more perfect Roman system is a chimera? Let a system of orthography be sanctioned by Government, let it be taught in the native schools, and let it be understood that petitions and official communications written in this character will be preferentially received, and the work is half done. The natives of India, both Hindu and Musulman, are keenly alive to the necessity of acquiring some of that knowledge which makes their rulers powerful, and of adapting themselves to the form of government under which they live and prosper. Any means of acquiring knowledge, and any opportunity of adding to their qualifications, are eagerly sought after by thousands of inquiring and aspiring youths. Once let the Romanizing system receive the sanction of Imperial favour, and it will be eagerly examined. Once diffused, and once practically applied, it may be left to fight its own battle, and to secure its own acceptance.

Sir William Jones, the earliest of our Sanskrit scholars, was the first to lay down a regular system for the rendering of Oriental words in Roman characters. His system, with a few modifications, has ever since been used by the learned. It is scientific in principle, and practical in application; it is used in all books of authority, and yet it cannot be said to have ever come into common use. Rival systems like that of Gilchrist, although absurd in principle and worthless in practice, have found supporters; and besides the systematizers, there have been the erratic independent transcribers, who have made a perfect Babel of confusion. The reason of this is not far to seek. In English we have perhaps the worst vowel system in Europe, and we have a constant tendency to tone down the sounds of all our vowels to the primary vowel sound. We use them all in turn to represent this elementary articulation. Thus in the short sentence, "the mother-bird flutters over a myrtle," we have each vowel used to express this one sound; in the second word we have *o* and *e*, in the third *i*, in

the fourth *u* and *e*, in the fifth *e*, in the sixth *e*, and in the seventh *y*. Look also at the varying sounds of *i* in *pin*, *pine*, and *machine*, and of *u* in *but* and *put*, and it must be seen that it is impossible to arrive at anything like precision with such a medium. Sir W. Jones adopted the Italian vowel system, and with one alteration the scheme which he devised continues in use. That bugbear of Englishmen, that sound which we have called the primary vowel sound, is represented by *a*, such as we have it in the word *America* and in a thousand others. The unvarying sound of this letter must be well understood and the rest is easy. There are three short vowels, *a*, *i*, *u*; three long sounds of the same vowels, *ā*, *ī*, *ū*; and four diphthongs, *e*, *ai*, *o*, and *au*. These are sufficient to represent fully and accurately every vowel sound, excepting some vowels peculiar to the Nagari alphabet and too technical to be here noticed. As we have seen that our English vowel system is about the worst, on the other hand our consonantal system is admirably fitted for the object in view. Its *ch* and its *j* exactly correspond with Indian letters for which Germans and Frenchmen are obliged to employ such barbarous combinations as *tsch*, *dach*, &c. &c. But few modifications are needed; *c* is discarded as unnecessary, for *k* represents its guttural power, *s* its sibilant. In the same way *g* always has the hard Saxon sound, and never the *j* sound which we have got from Latin and French. These changes are all that are really needed; but as the letter *c* is disused in its old character, it would certainly be a gain if it were used to represent *ch*, which is in reality a simple letter, not a double one as we write it. There is also one other point in which a great improvement might be effected by a small change. The Indian alphabets abound with aspirated consonants. Every consonant capable of aspiration has a distinct form to represent that aspirate. Thus *b* and its aspirate *bh* are two totally distinct letters, not mere combinations. Now these aspirated letters occur very frequently, so it has been proposed to get rid of the incessant repetition of *h* by adding an accent or a dot to give the aspiration to the simple letter. Both these practices are open to objection. Such a use of the accent is entirely distinct from its ordinary application, and all external marks like dots are liable to be neglected in writing, and knocked off in printing. In English writing *i* is often left without its cross, and still more frequently the *t* is deprived of its dot. Therefore the change, if made at all, must be effected by a slight modification of the letter itself, one that is uniform in its application and easily imitated in writing. It might be accomplished by introducing a spot or an open circle into the outline of the letter; into the loop line of the *b* and *p* for instance. This, however, is a matter of detail which cannot be well discussed without illustration. It is a matter, however, of some importance; for the elimination of the oft-repeated *h* would shorten many long words, and the percentage of pages it would save would be something considerable.

A conference of three or four practical men possessing the requisite knowledge might very quickly decide upon the best system. In fact, the work is all but done, and needs only the sanction of a recognized authority. We are aware that some twenty years ago a Committee of learned men was formed in London to decide upon a system. But the aim of that learned body was not confined to merely Indian languages; their object, like that of Professor Lepsius, was to invent a universal alphabet capable of representing and accurately expressing all the sounds of all the various languages of the world. It failed, as might have been expected, and the scheme may be left among the dreams of the past, as only less improbable of realization than that of "One Universal Language." But what we are advocating is no mere dream; it is a reality which has stood the test of experience. Our only fear is that it may fall under the direction of the theorists, and, with all due respect let it be said, of German theorists. The Germans, having no letter equivalent to our *ch* and *j*, have employed an accented *k* for the *ch*, and an accented *g* for the *j*; and they have endeavoured to persuade us to do the same, on the ground that, as these letters interchange in certain positions, they are related to each other, and should be represented by similar symbols. The theory, however, if good for anything, must be stretched a little further, and include *t* and *d*, which in certain positions are changed to *ch* and *j*. But why need these theoretical niceties be touched upon? The English language, though one of the youngest offshoots of the Aryan stock, has received these two sounds *ch* and *j*, exactly identical with the sounds of similar letters in Sanskrit and the other languages of India, and it would be a decided loss to reject these letters, more especially as no trace of the German refinement is to be found in the Indian alphabets. We English are rulers of India; it is our duty and our interest to bring the natives of that country into the closest possible relations with ourselves, and we shall best effect that object in the matter before us by keeping as close as the circumstances will allow to what is English.

The great diversity in the ordinary modes of spelling, upon which we have above adverted, induced the Government of India a few years since to direct that in all official communications the proper names of places should be written according to a spelling laid down. Action has thus been taken in the matter, and some good effected. What has been above proposed would go much further, and might not for a few years be followed by any great success. But the advantages of the Roman system are so great, and the benefits that would flow from its use both to the people of India and ourselves are so manifest, that an effort ought to be made to give it a fair trial in the education of the rising generation. If it is thus put to the test, and is favoured with the

encouragement that it merits, the result, though it may be tardy, can hardly be doubtful. A reform will be accomplished of more real value and importance to the millions of India than many of the plans which engross the minds of statesmen and occupy the time of senators.

BRIGHTON.

A FRENCH journalist who recently paid a visit to Brighton has given a somewhat disparaging account of it to his countrymen. He did not admire the architecture of the Grand Hotel, or the dresses of the women. He resented the stern demeanour of the waiters who surrounded him at table like so many Grand Inquisitors, watching every morsel he ate, and observing with solemn and, as he imagined, vindictive, curiosity the way in which he handled his knife and fork. Altogether he found Brighton to be a very stupid and tiresome place. We were rather surprised to read this account of Brighton by a Frenchman, and above all by a Parisian, because we should have thought that of all parts of England this is just the part which would have suited him best. Nobody could expect a Parisian to like London. It is too big, too busy; it wants concentration. Paris is a considerable place on the map, and according to statistics of houses and population; but the real Paris consists of only one or two boulevards and half-a-dozen streets. The rest of the city is not Paris, but only a sort of annex, where people go to sleep. And this is what a Parisian likes—to have effects concentrated and brought within easy range. From this point of view Brighton might be favourably judged. The King's Road is its boulevard, and to most of its visitors it represents the town. The streets which stretch up the hills behind merely supply sleeping accommodation for the inhabitants and their guests. The life of Brighton is concentrated on the famous Parade. Altogether there is something strongly Continental in the aspect of Brighton. The white houses and green blinds, the spacious promenade, the procession of gaily-dressed people finding amusement in simply walking up and down, the clearness of the atmosphere, and a certain exhilarating quality of the air, all help to make one think of Paris and its boulevards. The French writer of whom we speak did not discover in Brighton anything answering to his notions of an *établissement*, and probably he missed the open *cafés* and little tables of his native land. The former would of course, in the present state of English society, be a hopeless enterprise. Alasack! if it had survived, would long ago have degenerated into a music-hall, with pipes and beer. But as to the little tables we are disposed to sympathize with our foreign guests. It would appear as if Englishmen could never take refreshments of the lightest kind without retiring into dark and musty seclusion at the back of a confectioner's shop or into the coffee-room of an hotel. Is there anything to be ashamed of in sipping a cup of tea or coffee or eating an ice, or even drinking a glass of sherry, that one must needs hide oneself, as it were, in a cave before committing the enormity? At certain seasons the climate is perhaps to some extent against this sort of outdoor enjoyment, but arrangements could easily be made to provide shelter without blocking out light, air, and the cheerful sight of the people in the street. In contrast with most English places, Brighton has all the brightness and sprightliness of a Continental town, and a spirited Town Council has done as much for it as a lavish Prefect of the Second Empire, with the State Treasury to dip his hand into. No doubt the town is kept up as a commercial speculation, but still it is creditable that it should be kept up with so much care and liberality. From Hove to Kemp Town there is a noble highway, some three miles long, facing the sea. Both the roadway and the broad footpath are well-watered and kept in excellent condition, and there are handsome and comfortable seats at every few paces from one end to the other. The lawn at Cliftonville is always fresh and smooth; and the whole town is kept scrupulously clean. Vast drainage works are being constructed at a heavy expense in order to make the sanitary arrangements as perfect as possible. These may seem prosaic matters, and it is easy to say that they are attended to only because they pay by attracting visitors; but, after all, it is not every town that has sense to understand this, or spirit to carry out the thing thoroughly. It must be admitted that Brighton makes the most of its natural advantages.

It is not very easy to account for the differing social attributes of seaside towns. Brighton is the nearest of any of them to London; it can be reached by railway in an hour or so at a very moderate cost, and during the greater part of the year there are numerous cheap excursion trains. In point of fact, vast numbers of all classes of people visit Brighton; and yet you never see there any of the extraordinary persons who swarm at Margate and Ramsgate. The blatant animal in zephyr coat and sand-shoes, with a field-glass slung over his shoulder and a telescope under his arm, has never been domesticated there, nor the more odious female creature of his kind. At Margate he is at home. There is something in the air that woos him to cast off any artificial reticences which he may have found it necessary to observe in town, and to disport himself freely after his own nature. He can sit at the window in his shirt-sleeves, and smoke a long pipe, and gorge himself with shrimps, while his soul is soothed by a ceaseless serenade of negro melodies. The doctors just now have a maris for Margate, but they scarcely make sufficient allowance for the depressing influence of its intense and corroding vulgarity. Everything there seems to appeal to the lowest tastes and grossest

appetites. The ideal of enjoyment is an uninterrupted course of cheap gluttony and boozing. It is hard to say why people who like this sort of life should go all the way to Margate, and should avoid Brighton, unless it is that they have Margate all to themselves. Brighton is famous for its eccentricities of costume, and there is no local law against shirt-sleeves or sand-shoes; but eccentricities of this kind would be apt to be unpleasantly conspicuous. The fact is, that the respectable element is sufficiently strong to hold its ground, and the prevailing social atmosphere is unfavourable to the gambols of the wild cockney. The vanities of Brighton tend in another direction. The well-known promenade presents a dazzling panorama of the follies of fashion, and of the Simian imitativeness of the human race. The Parade is open to all the world. The benches are free to every one, and for twopenny you can mix with the quality on the Pier. The hackney-coach runs by the side of the dowager's chariot as long as its spavined nag can keep the pace; and the occupants assume for the time of hiring the dignified airs of carriage company. A striking costume is quickly copied; the cut and colour of rich silks and velvets are reproduced in cotton and alpaca, and every class apes its superiors in such materials as it can afford. An old newspaper of the days of the Regent tells us that His Royal Highness walked out one day in a plum-coloured coat and brown hat, accompanied by the Countess of Jersey, elegantly dressed in white, with a gold bandeau on her head, from which was suspended a most beautiful veil. The prevailing dress at this time was, it seems, a gipsy hat, pink, lilac, and white mantles, and brown parasols—perhaps to match the Regent's hat—trimmed with white lace. "Some of the first-rate *dévotes* wore dove-coloured stockings and shoes." A gentleman who dressed from tip to toe in green was thought, however, to have deviated into eccentricity, and this opinion was confirmed when he soon after jumped off the cliff into the sea. The spirit of the royal man-milliner would seem still to pervade his favourite haunt, and the *dévotes* of to-day show no falling off in affectation or extravagance of dress. Simple-minded people from the quiet suburbs of London appear to derive considerable gratification from reading their names in the "Fashionable Visitors' List," where they are inserted free of charge on the chance of a copy or two being thereby sold. It is an historical event for the Bugginses of Peckham (J. Buggins, Esq., and Mrs. Buggins, J. Buggins, Jun., Esq., the Misses Buggins (4), Master Buggins, Clytemnestra House, Gladstone Terrace, Adrianople Road, Peckham, S.E.), to be commemorated in the same type and on the same sheet as marchionesses and earls; and you may be sure several copies are despatched by post to dazzle friends in the country, while another twopenny is spent in procuring one for preservation in the family archives at home. The local newspapers also chronicle, from time to time, in similar fashion the arrival of more interesting visitors in the shape of additions to the Aquarium. The enthusiasm of Brighton for this branch of natural history, especially in conjunction with bath-buns, lemonade, and a brass-band concert, shows as yet no signs of abatement. Apart from the scientific value of this entertainment, it is believed that the contemplation of fishes in their native element (especially by gas-light, and to the airs of Offenbach) has a soothing moral effect. It is said that when Mr. Disraeli visited this exhibition he was very much struck by the resemblance between the busy play of the grasping tentacles of the octopus and the policy of the Government. He apparently forgot to bring this in in his letter to Lord Grey de Wilton, but it will do for another time.

To sentimental admirers of the romantic and picturesque, Brighton is understood to be peculiarly distasteful. There is no country there, they complain, but only a smaller London by the sea. In point of fact, Brighton is, from its situation on a number of hills, almost as many as Rome sits upon, really a very picturesque town, but to appreciate this aspect of it, it should be viewed from some of the higher parts, towards the back. For those who can appreciate the beauty of the Downs, there is also pleasant country within easy reach, and there is plenty of foliage to refresh eyes jaded with the glare of the sea along the valley of the Steyne, and so up to Preston and Hassock's Gate. Even admitting, however, the want of trees, this, as a guide-book points out, is rather an advantage, since "the miasma arising from the decomposition of vegetable substances is, therefore, quite unknown." More would perhaps be thought of other features of Brighton if the sea were less exclusively worshipped. The whole construction of the town has been influenced by this fanatical devotion. The value of a house is estimated, not by its style or accommodation, but by the extent of the view which it gives over the sea. Hence it is that the streets perch themselves at all sorts of queer angles, and the houses twist and strain and sidle to catch even the least little glimpse of the sacred object; if you go up-hill you find the houses grow taller and taller, as if each row were striving to peer over the heads of those below. The Marine Parade is, we suppose, in its whole length quite unequalled in any part of the world, and there is every prospect of its being soon stretched to Portelade and Kingston, if not on the other side towards Rottingdean. One of the peculiarities of Brighton is its diversified character. It consists of five or six different quarters, each with its own peculiar climate. It has also a succession of different seasons—the bathing season, the fashionable season, the season for farming neighbours near at hand, the domestic season, when it makes merry by itself, and the season for the people who are fond of east wind. During the domestic season the disproportion of the sexes is harrowing in the extreme.

The resident population then consists chiefly of widow ladies and their daughters, schoolgirls, and schoolboys. Men come only on flying visits, and the male element at parties has to be supplied by half-a-dozen infants from an academy, under the superintendence of an usher. The social tone of Brighton has been described by its detractors as worldly, not to say fast. Some good people profess to be shocked by its vanities, and in consumptive circles at St. Leonards its gaiety is referred to with a thrill of horror. To show how little foundation there is for these cruel imputations, it may be stated that on Sunday evenings the brass-bands on the two piers and the brass-band in the Aquarium as well as the other half-dozen bands up and down the town all play selections of sacred music. Flirting to accompaniments by Handel may almost be regarded as a devotional exercise.

THE DISTRIBUTION OF POPULATION.

WE suppose we may take it for granted that everybody is by this time tolerably familiar with the general results of the latest Census, but there are one or two points in regard to the distribution of population which deserve special attention, and which are brought out very clearly in Mr. Lewis's useful Digest. That the population of the United Kingdom is, in round numbers, over thirty-one and a half millions, of whom twenty-two and a half are to be found in England and Wales; and that this represents an addition in the course of ten years of two and a half millions, being at the rate of 8.8 per cent., or a daily augmentation of 700, are broad facts which it is easy to remember. The increase has been mainly in England, which has advanced at the rate of 13 per cent., while in Scotland the increase has been only 9.7 per cent., and in Ireland there is, mainly owing to emigration, a positive decrease of 6.7 per cent. In England and Wales the rate of increase during the last decade shows an advance on that of the two previous decades, but it is still below that of the periods between 1811 and 1841. In that memorable decade between 1811 and 1821, which included the general peace, the return of our armies and navies, the reduction of taxes, and the expansion of industry and commerce, the increase of population was over eighteen per cent. In the successive periods down to 1841 the rates of increase were sixteen and fourteen and a half per cent., in 1851 twelve and a half, in 1861 twelve, and now just over thirteen per cent. Between 1851 and 1861 we had not only two great wars, but emigration was particularly active. In the last decade emigration was somewhat checked by the American war, and the number of emigrants from the United Kingdom was four hundred thousand less than in the preceding period. The general prosperity of England is shown, not only by the increase of population, but by the increase of houses. In 1871 there were 4,259,000 houses standing in England, and 37,800 houses were being built—an unprecedented activity. Reckoning houses built and building, there were 5.45 persons to a house in 1811, 5.18 in 1851, 5.08 in 1861, and 4.98 in 1871; so that, while population multiplies, the pressure of overcrowding is somewhat diminishing. Altogether these facts would seem to point to the conclusion that during the ten years between 1861 and 1871 the general condition of the country was thriving and comfortable. The stimulus of active trade and prosperity kept up the natural growth of population; the attractions of emigration were diminished by hopeful prospects at home; and the increase of house accommodation indicates an advance in the conditions of domestic life. The emigration from Ireland is a question that must be taken by itself. The vast exodus which followed the famine naturally tended to unsettle and disturb the remaining population, and to direct their thoughts to the new land to which their friends and relatives had gone. It is known that the Irish in America have sent over enormous sums for the purpose of enabling their friends to join them there, and the emigration of the last decade may be attributed in a large measure to the continuous influence of the first great movement in 1845-6.

When we come to look into the details of the Census returns, we find that the tendency of population to gather in towns is becoming still more marked. There is a constant drain from the country into the towns; but, on the other hand, if we may judge by London as an example, there would seem to be natural limits to the growth of great cities. A city cannot grow in numbers irrespectively of house accommodation, and the supply of houses depends not only on the amount of available building ground, but on the scale of rents, distance from the scene of business, facilities of access to and from, and other considerations. London is still growing, but its growth is slower than it used to be. The rate of increase is diminishing with each decade. Anybody who looks at a map of London in which the different administrative districts are marked will see that it is divided into a series of rings. In the centre—the hernel of the whole—is the City; next comes the Metropolitan Board district; and then the Police limits. In the City depopulation has long been going on at a rapid rate. The resident population of the City is less than it was a couple of centuries ago. Between 1861 and 1871 it has decreased from 112,000 to 75,000. There are many parishes in which the number of inhabited houses is under twenty; in others it is only five or six; in St. Bartholomew-the-Less it is only three. Nor is this process of depopulation observable only in the City. It has also spread to other parts of the capital. Since the last Census there has been a falling off in the population of West-

minster, St. George (Hanover Square), Maylebone, St. Giles, Strand, Holborn, Shoreditch, Whitechapel, and St. George's-in-the-East, as well as London City. The explanation of this state of things is, of course, that the central parts of London are being used more and more for shops, warehouses, and places of business, instead of for habitations. The people who do business there during the day have their homes elsewhere. It is calculated that the City is visited every day by some 700,000 persons, of whom nearly 200,000 are regularly employed there, while the resident population is only 74,892, or 36,700 less than it was in 1631. While the inhabitants of the City are thus decreasing, the inhabitants of the next zone—that of the Metropolitan Board of Works—are, as appears from Mr. Lewis's figures, increasing, but at a decreasing rate; those within the Police limits are steadily increasing, and at a slightly increasing rate; while in the ring between the limits of the Board of Works and the Police limits the increase has been more than fifty per cent. in ten years. The process which is going on is pretty much this—that the heart of the metropolis is gradually being emptied of its resident population, which is thus driven further and further outwards, overflowing into districts beyond the limits of London altogether, and that it is only in the outer rings that there would seem to be any active growth of population. The railways have now appropriated a vast amount of ground in London, and the number of warehouses and places of business is increasing. The tendency to depopulation in the centre of the town will no doubt continue, and in proportion as it does the room that would otherwise be left for new-comers in the external zones will be filled up by Londoners driven from their old homes. There are two causes which may be expected to operate as a check upon the development of London. One is the difficulty of finding houses within a suitable distance of the business parts of the town at a moderate rent, and the other the increasing activity of the provincial towns. It is becoming less worth the while of pushing men to come to London; their chances are almost better in their own districts. Manchester, Birmingham, Hull, and other of the chief towns have grown considerably, but the increase is more remarkable in the case of younger towns. Thus Bradford has risen in ten years from 106,000 to 145,800; Crewe from 8,000 to 17,800; Darlington from 15,700 to 27,700; West Hartlepool from 12,600 to 21,110; Keighley from 15,000 to 19,700; Newcastle from 109,000 to 128,000; Sheffield from 185,000 to 240,000; and so on. Middlesbrough has doubled its population in ten years, and Burrow-in-Furness has risen in a comparatively short period from a little fishing village to be a good-sized town, with splendid docks, steel works, flax and jute works, and branches of almost every important industry.

The most curious results of the Census are those which illustrate the shifting of population. In the London Registration Division, which includes parts of Middlesex, Surrey, and Kent, the actual increase of population exceeded the natural increase by excess of births over deaths by 120,000; and, after allowing for omissions in registration, this would represent the immigration. In the South Midland Division, including Herts, Bucks, Oxfordshire, Northamptonshire, Huntingdonshire, Bedfordshire, and Cambridgeshire, the increase by births is more by 32,000 than the actual increase, and here, of course, we come on traces of emigration to other parts. In the Eastern Division, which comprises Essex, Suffolk, and Norfolk, the actual increase is nearly 70,000 below the natural increase. In Cornwall, notwithstanding an excess of 47,000 births over deaths, population has decreased by 6,500, chiefly in consequence of the departure of miners for other districts and the colonies. The West Midland Division also lost 97,200 of its natural increment in this way, and the North Midland 66,000. In Lancashire, on the other hand, the increase of population was 96,000 over the increase by births. Relatively the increase in Yorkshire is much greater than during the previous decade, and surpasses that of Lancashire. The actual gain of population is 380,000, as against 286,500 by births. The increase of production has been greater than the increase of workers, on account of improved machinery. But it is in the Northern Division, comprising Durham, Northumberland, Cumberland, and Westmorland, that the increase has been greatest. In Northumberland, Cumberland, and Westmorland the excess of births was greater than the actual increase; in Durham the excess of births amounted to less by 82,233 than the actual increase. The immigration was due to the great coal-fields round Newcastle and Durham, the smaller field round Whitehaven and Workington, the iron-smelting, the manufacture of machinery and chemicals, and the ship-building yards. In the Welsh Division the actual increase was 47,000 less than the increase by births, so that the influx of workpeople into the mining districts does not equal the emigration of Welshmen. The county which has made the greatest progress in population since the beginning of the century is Durham, which shows an increase of 359 per cent.; Monmouth ranks second, with 329 per cent.; Lancashire next with 319, and Surrey with 307. Stafford shows an advance of 254 per cent., Middlesex of 210, Warwick 207, Cheshire 192, Kent 175, Sussex 162, Hampshire 148, and Derbyshire 135. Then, at the other end of the list, we have Wilts with an increase in seventy-two years of only 40 per cent., Herefordshire 42, Shropshire 47 per cent., Oxford and Westmorland each 59, Norfolk 60, Bucks 63, and Dorset 71. It will be seen that the decrease is in the purely agricultural districts, and the increase is in or near the industrial centres. The great coal region has drawn towards it a considerable body of population from the rest of the

country, and it is evident that, hitherto at least, the wages of the miners have been sufficient to command an increasing supply of labour. On the whole, the results of the Census exhibit a satisfactory picture of the progress of the country as regards population. If, on the one hand, population is not increasing at the rate which alarmed Mr. Malthus and his followers, on the other hand there are no such symptoms of stagnant and depressed vitality as are to be seen in France, and even—we are of course speaking of the natural increase by births—in some parts of the United States. In England the increase of population is brisk enough to indicate substantial prosperity, and there are also signs of a healthy movement of population from one part of the country to another, in accordance with the course of trade and developments of industry.

THE BRITISH HEBE.

NOT long since some of the daily papers gave a curious account of a contest of barmaids which the managers of one of the metropolitan pleasure-gardens had introduced into their enticing programme. We had not the privilege of witnessing this interesting spectacle, and cannot therefore be quite certain of the precise nature of the contest. We may conjecture however that, since quickness and adroitness are among the chief excellences of this public benefactress, the competition mainly turned on the display of these qualities. Other points ought no doubt to be taken into account in forming a perfect estimate of her qualifications. Thus the possession of a wide originality of mind in respect to novel and piquant toilets would, we suppose, be regarded as an eminent recommendation. Nor would it perhaps be irrelevant, in gauging the relative merits of a number of these candidates, to inquire into their powers of charming, detaining, and conciliating their clients by the graces of smile, gesture, and speech. A rough test of this last qualification might be found in the relative number of distinct smiles per minute executed by a competitor, or, still better, by the number of men attracted and chained to her particular counter.

Our modern English society presents few more curious phenomena than the well-known figure of the barmaid. It may be a disagreeable reflection to worshippers of the past, yet it seems tolerably certain that the pleasant image preserved in our literature of the fresh rustic maid whose rosy cheeks and timorously coy looks lent in the eyes of our travelling forerathers an added charm to the tankard of sparkling ale which she presented to them, is now fast disappearing. Her lineal descendant is the knowing, dashing barmaid of our cities. The rapid progress of communication is fast opening up the most secluded corners of England and Wales, and one may find in inn of some of the quietest and loveliest nooks young women who, from the occasional visits of tourist or commercial traveller, display all the characteristics of the city barmaid. She is without doubt a development of our present style of life. Our closely packed cities and towns, with the rapid and bustling locomotion of their citizens, afford but few opportunities for the pleasant desultory chat in which the bearer of the exhilarating cup was once wont to indulge her idle listeners. She has to confront a vast and fugitive throng of strange faces, and must in a sense be all things to all men. In place of a few confidential acquaintances, she must content herself with a swift succession of momentary intimacies. She has become in a new sense a public functionary, set face to face with the noisy and hasty stream of society which is ever eddying about in our great centres of population.

The qualifications of this new order of public ministrant may all be deduced from this view of her function. Of course the traditional supposition that Hebe's successors ought to possess some of her characteristic graces has still its effect, and it appears to be tacitly recognized that, although properly debarred from more special and tender relations with her clients, the modern bearer of pewter should possess certain personal fascinations. As a public ornament to be simply gazed at, it is desirable to invest her with as much magnificence as possible, and accordingly most kinds of personal attraction, both natural and adventitious, appear to be recommendations. Only in these fascinations for the eye there must be a certain recognition of her sublimely impartial, we were going to say impersonal, service; and while there should be in the arrangement of the hair, style of dress, and jewelry everything of an imposing and dazzling character, anything suggestive of a weak coquetry should be excluded. Beyond these material blandishments, the principal ingredient in the æsthetic fitness of this queenly regaler of the public appears to be a large measure of moral self-restraint, showing itself in a firm and imperturbable self-possession, an apparent exemption from all particular modes of sensibility beyond an inexhaustible spring of complacency, and a certain grandiose address which impresses the beholder with the dignity of its subject, while it sharply rebukes any thought of a frivolous sentimental relation. One great excellence of her art lies in the ability to meet, not with any show of resentment, but with a delightful unconsciousness, all the nascent forms of flirtation with which she is now and again assailed. Accepting as her most certain axiom that the male division of her species are apt to be silly in presence of her sex, and especially so under the insinuating influences of their favourite beverages, she has to set herself to the task of checking yet conciliating, ruling yet never ruffling. Nothing, she well knows, would serve more to impede her good offices to the public than any show of favouritism towards the

recipients of her bounty. Hence one main part of her duty consists in an adroit method of pleasing and flattering every successive comer by a momentary direction of all her powers of fascination towards himself, yet in so beautifully uniform a manner as to leave no room for the depressing sentiment of jealousy in the most sensitive of her fugitive admirers.

Nevertheless this theory, drawn from what the Germans would call the *Wesen und Bestimmung* of a barmaid, does not any more than other *a priori* reasonings strictly accord with the facts. Although it may easily be seen that she ought to be the lofty and impersonal existence we have described, in actual practice she commonly betrays unmistakable signs of an ordinary feminine personality. Possibly the transition from the simplicity and sensibility of the rustic to the perfect self-abnegation of the city official is as yet incomplete. However it may be, one strongly suspects that there are few of the class who do not disclose on narrow observation some of the older and more persistent instincts of the sex. Although there are seasons when she assumes the bearing proper to her exalted mission, such a complete suppression of self-consciousness is no doubt a great mental strain, and we need not wonder if, in her less busy moments, when the fussy miscellaneous crowd no longer besieges her, she looks for a little compensation in the shape of a more private and tender intercourse with a chosen few of her clients.

It must be confessed, too, that the complete obliteration of all common feminine sensibility required by the high functions of the barmaid is rendered exceedingly difficult through the rude importunities of some of her *clients*. There are several well-marked varieties of these trespassers within the sacred boundaries of her hidden personal life. For example, there is the sleek complacent flatterer of the whole sex, who knows so well how to assume the familiar air of an old acquaintance. At a railway buffet or in the snug bar-parlour of an hotel one may find men of this suave bully type. They pride themselves on the number of young women whom they are able to confuse by artful leer or dexterous wink, and are never so well pleased as when they succeed by some skilfully inserted joke in driving the younger and less rigid assistants at a counter to hide their laughter from the eyes of the severe manageress. These deeply versed connoisseurs of the female heart are generally somewhat advanced in years, not seldom indeed verging towards what in other men would be termed old age. They appear as commercial travellers or in other functions to have had singular advantages in studying the characteristics of the sex. Little wonder perhaps if they commonly exert a kind of serpentine fascination on the easily discomfited objects of their wily assaults. Then there is the conceited youth to whom the counter which encloses the barmaid is a fit field for the manoeuvring of his many powers of fascination. He seizes leisurely moments between the trains to engage the eye and ear of some dazzling divinity. He leans gracefully over the counter, and retails his pretty stories of high life with every charm of aristocratic lisp and drawl. He is never weary of swearing by his favourite Pagan deity that his listener's charms surpass anything his wide experience has ever encountered. With such dulcet measures this minstrel practises on the ear and heart of his idle listener, confident that, if he persists long enough, he may produce a tremour of emotional life in what seems to others a passionless being. Once more, the divine calm of a barmaid's impersonal existence may easily be disturbed by the more pathetic kind of adoration paid her by youths generally diffident in the presence of the too dazzling sex, and not widely experienced in the art of entertaining them. It is not difficult to conceive what a halo of glory must invest these nymphs of the aleoholic fountain in the eyes of many a humble and sensitive city clerk. No doubt there are to be found even in the prosaic surroundings of bank or office ardent poetical temperaments to which some richly adorned successor to Hebe's throne would naturally present the stimulus to poetic dream and lyric ecstacy. To such the daily appearance of this magic creature must be as the illumination of their whole firmament by some resplendent orb. Half timorous, they hold themselves awhile at a respectful distance; and it is only after the worshipped one has condescended to smile on them, as on the rest of her public, in dispensing her bounties, that they venture on a nearer approach. To most women, we suspect, this incense from weak and inexperienced youth is very graceful. Hence it is scarcely a matter of surprise that the exalted public functionaries of whom we speak should once and again find themselves entangled in the meshes of a tender half-maternal sort of *limon* with some juvenile frequenter of their establishment.

We think, then, that ample allowance should be made for the feminine weaknesses which are certainly discoverable in these consecrated servants of the public. It cannot be supposed that a young woman fresh from the country will be able at once completely to smother every trace of girlish folly; and, beset as she is with such crafty and powerful corruptors, it is only natural perhaps that even in the midst of her most responsible offices a close observer may detect survivals of her primitive feminine culture. No doubt it would be very much better for the whole of her public if the waitress at our railway restaurants and elsewhere were completely exempt from these characteristics of her sex. It is notorious, for example, that she habitually gives the preference to all male comers, and renders her services to members of her own sex as disagreeable as possible by a certain jaunty air of superiority. One does not well see how this could be otherwise. The barmaid, accustomed to the undisguised admiration of the stronger sex, comes to regard herself as set high above the social position

grudgingly accorded to her by the more refined world, and she is naturally anxious to impress this assurance of moral elevation on her lady clients. Indeed one not unfrequently hears of brilliant achievements of social rank effected by these ambitious persons through the instrumentality of marriage. When a young woman feels that the proud lady she is at this moment serving may next year be below her in the plutocratic scale, it is not to be wondered at that her courtesy is of the scantiest. To the barmaid as to other young women men are possibilities of marriage, and hence have a value and claim a respect not belonging to members of her own sex.

There are one or two curious questions that present themselves in connexion with the life of a barmaid. When, for example, she yields to the fascination of certain youthful admirers, how does she manage to keep the competing suitors from open conflict? It seems not an uncommon thing for the most favoured of the class to have a nice little swarm of gentlemen friends buzzing their dromish music about her counter. Yet we never witnessed any unseemly collision between these rivals. A conflict of males around an elegant buffet, such as Mr. Darwin so quaintly describes as arising among beetles and other tiny animals, would be a very odd, though a somewhat disagreeable, spectacle. How the splendid object of these rival adulations manages to obviate this has always seemed to us a very mysterious matter. Then, too, one would like to know whether any members of the profession are philosophically inclined, and, if so, what their reflections are likely to be upon the male character. Few, if any, women within the precincts of respectable society have better opportunities of studying the characteristics of the opposite sex; and, if disposed to psychological observation, they might, we imagine, be able to acquaint the rest of the world with some curious facts bearing on the moral dignity of man.

DENBIGHSHIRE AND THE VALE OF CLWYD.

THAT which constitutes the attraction of Denbighshire and the Vale of Clwyd to the tourist is the surprise of green meadows and fertilizing streams, yellow cornlands and rich woodland scenery, numerous villages and parish churches—in short, the rural and civilized aspect of the country—coming after the bleak, barren grandeur of Carnarvonshire or Merionethshire. Nor is this surprise rendered less agreeable by an utter absence of the mountain scenery which the traveller in North Wales has learned to expect; for towards the east its hills, among which are Moel Ffenili and Moel Fannau, are as it were a continuous battlement to the plain; there are occasional grand views of the Welsh mountains proper to the west, and on the south the far-stretching Berwyn range above Corwen forms no inconsiderable rampart. It is indeed from Corwen and its railway station, now happily connecting the Vale of Clwyd with West and East, with Bala and Llangollen, that the visitor will do best to enter Denbighshire; for there is really but little to attract in Rhyl, except the sea, which is seldom to be seen, and a promise of accommodation and entertainment, for which a high remuneration is required, and which, so far as our experience goes, is ill fulfilled. Not that much praise can be awarded to the more inland hostleries of the Vale and country, if we except the “Wynnstay,” “Hand,” and “Castle,” at Wrexham, Llangollen, and Ruthin respectively, and an unpretending, but very snug, wayside inn, deserving to be better known, the “Plough” at St. Asaph. If, however, we enter Denbighshire from the south, the features which we referred to at the outset force themselves on the mind and eye. If we cannot say of it all that an old Latin Rhytmist said of a county on the Welsh border,

Unda et silva frequens, femina, lana, seges,

at all events for water, woods, and wool it may hold its own with ease. Without attempting a plenary claim to the Dee, which, rising beyond Bala, enters this county a little to the west of Llangollen, crossing the south angle of it, and as it passes Overton, Bangor Iscoed, and Holt forming the boundary line between it and Cheshire, it asserts the almost entire right to the Clwyd, which from its source almost to its mouth is a Denbighshire river, scarcely identifying itself with Flint till it becomes the Voryd, or tidal portion of the river. The Clwyd washes its two chief historic towns Ruthin and Denbigh, whereas, when it enters Flint, it divides with the Elwy whatever of prestige may arise from the Cathedral of St. Asaph, which indeed gets its Welsh name “Llanelwy” from the latter. The character of the Elwy is as romantic and wild as the mountains towards Llanwrst from which it springs, while the Clwyd is more of the tranquil lowland type. Along the former and the Alod we look not in vain for the cataracts and waterfalls which are more plentiful in Carnarvon and Merioneth; in the course of the latter we come upon the fertile plains of what Drayton calls “Clwyd’s most precious lap,” and the well-to-do heights where men have built their towns and cities to dwell in, by reason of having fruits of the earth to gather in, and wealth gotten therefrom to keep or to lose.

Tokens, by the way, of such wealth and plenty are seen in the Denbighshire churches, old and new, which their founders and restorers have seen meet to adorn with carved roofs and other ornament, not content with the capital red and free stone which the county supplies from its abundances of quarries. We refer not so much to the exceptionally grand churches of Llanwrst on the western, and of Wrexham, Holt, and Grosford on the eastern border of Denbighshire—all remarkable, as may be seen in Mr. Lloyd Williams’s *Churches of Denbighshire*,

for the lavish wealth of stall, screen, and roof-carving which grace the interior of these fine Perpendicular structures—nor yet to that ruined pile, the object of many an archaeologist’s pilgrimage, the Cistercian Abbey of Valle Crucis. The village churches right and left of the railway or of the pedestrian’s path are mostly found to possess some architectural interest, and to enshrine some altar-tomb or rood-loft, or other evidence of the pious munificence of founders and benefactors. Named for the most part from some Welsh saint, Collen, Marchel, Cynhafal, Dyfnog, and the like—for which readers may consult, if they please, the *Lives of the Cambro-British Saints* in the Welsh MSS. Society’s publications—these churches deserve commemoration for their many interesting features, which cannot fail to arrest the attention of the passer-by. Commonly they are found to have a double aisle, the one equal and parallel with the other; often a bell-turret only instead of a tower or spire. But if we take the railway from Corwen to Rhyl, Derwen Church has a handsome rood-loft; Ruthin an elaborate perpendicular oak roof, curiously panelled and ornamented; Llanarmon-in-Yale its monumental effigies of a fourteenth-century knight and of a bishop; Llangynhafal and Llanrhaidr fine chancel roofs and good carving, and the latter a celebrated Jesse window at the east end. When we come to Denbigh itself the Church of St. Hilary within the precincts of the Castle is ugly and barnlike enough, though noticeable for its “squints” or “lychnoscopes” at each side of the chancel arch. But the old parish church of the town, some three-quarters of a mile from the station, variously styled Whitechurch from its white tower, and St. Marcella or Llanfarchall from the female saint to whom it is dedicated, has two parallel aisles divided by centre arches rising from light octagonal pillars; above which is a cornice rich in sculptured detail, and a hammer-beam roof arising from large corbels, and having for bosses a great variety of grotesque animal carving. We might go on to notice divers other old churches, such as Henllan, with its detached and massive square bell-tower, or the beautiful modern church of Trefnant, in a newly constituted district of the same parish, which, second to Bodelwyddan (near Rhyl and St. Asaph), the exquisite memorial church erected by the Dowager Lady Willoughby de Broke, may serve to show that in zeal for church-building modern Denbigh is not a whit behind ancient. Bodelwyddan is something more than an instance of what may be achieved by ungrudging expenditure—a proof of the feasibility of thoroughly harmonized taste in details and as a whole.

But it was only in passing that we meant to speak of the Denbighshire churches, which happily are in a fair way to have their *entree sacer* in the Rev. D. R. Thomas, the Rector of St. Mary’s, Cefn, whose more than half-finished *History of the Diocese of St. Asaph* (published by James Parker and Co.) is very much more in aim and execution than many English dioceses can yet boast, being the work of an excellent scholar and antiquary qualified for his task alike by enthusiasm and research. Connected with the water of the county, as also with its churches, is a characteristic peculiarity of great archaeological interest—the frequent occurrence of “holy wells,” vouchsafed of old by this or that patron saint, and not yet shorn of their healing power in the estimation of the simple rustics. We have noted elsewhere the wells of Cornwall. In the neighbouring county of Flint there is the famous well of St. Winifred, upon which it is not now within our scope to touch. But it is not every tourist who knows that within an easy walk of St. Asaph, or a short drive from Rhyl, in a lovely little valley enclosed by the Cefn rocks on one side, and by overhanging woods skirted by the winding Elwy on the other, there is a sort of twin “Holy well” called Ffynnon-fair, in the township of Wigfair (Mary’s Grove). Out of the cavernous limestone formation a cold pure spring wells up at the rate, it is said, of one hundred gallons a minute, into a basin of hewn stone, with three of its sides formed into salient angles, from each point of which once rose a pier supporting arches and canopied work resembling those at Holywell. Adjoining the well are traces of a chapel anciently connected with St. Asaph, at which it would seem that marriages were solemnized up to 1640. Though, however, this Ffynnonfair long had the credit of healing virtues, and was held in popular veneration, it would appear that the march of civilization tended to the dilapidation of this woodland sanctuary. When the pilgrim’s feet began to seek it less frequently, it offered a temptation to the local cottage-builder. Hence, for the preservation of so interesting an old memorial, it is just as well that the state of things no longer exists which Mrs. Hemans pictured apropos of this very Our Lady’s Well:—

There is heard no Ave through thy bowers;
Thou art gleaming lone ‘mid thy water-flowers;
But the herd may drink from thy gushing wave,
And there may the reaper his fore-head lave;
And the woodman seeks thee not in vain—
Bright fount! thou art nature’s own again!

The fact is that the well and the ruined chapel are enclosed by a protective iron railing, duly locked and barred, which no one will regret who cares for the maintenance of a feature so singularly characteristic of a district of springs and well-legends. Near the church of Llanrhaidr, three miles south-east of Denbigh, too, is an ancient well, Ffynnon St. Dyfnog, said to work miraculous cures, in gratitude for which the offerings of patients contributed to decorate the beautiful east window which tradition incorrectly assigns to the spoliation of Basingwerk Abbey. At Llangynhafal, a parish near Rhewl station, next beyond Ruthin, there is also a well on the hillside dedicated to St. Cyndafal,

formerly famous "for curing warts." This, we learn, was partly done by pricking them with a pin, which was afterwards thrown into the well. This parish, by the way, contains the famous Moel Panmau within its partly unenclosed area. Yet another storied well is in the village of Llandegla, which gets its name from the parson, St. Tecla. Its waters were a specific for epilepsy, called hence St. Tecla's Disease. Llandegla is on the river Alun, and to the south of Ruthin, on the road to Wrexham. The ceremonies with which a patient had to comply were not a little complicated. A bath in the well, a walk thrice round it, a triple recital of the Lord's Prayer, and a votive offering of fourpence were scarcely half the business. A cock or hen, according to the sex of the patient, had to be offered to Tecla, and carried solemnly around the well, the churchyard, and the church. The votary then made a night of it in the chancel, sleeping under the altar, with its cloth for a coverlet and the Bible for a pillow. At daybreak he left the fowl in the church with another offering of sixpence; and, if the saint willed a cure, the disease passed to the bird, which forthwith died. No such traditions attach to the well and sulphur spring of Llandegley, in the county of Radnor and diocese of St. David's, though from the name we should surmise that it was dedicated to the same Saint, and it is certainly held in esteem for skin diseases. Quite to the north of the county, near to Colwyn, but higher up in the hills, is another famous well of different properties. Ffynnon Elian, or the "cursing well," about half a mile from the church of Llanellian. St. Elian's miracles seem to be miracles of a destructive or injurious tendency, wrought in response to a deposit or offering made for the purpose of calling down mischief on an enemy. This enemy's name was written in a book, a pin thrust through the name, and a pebble with his initials on it was thrown into the well. Not until the name was erased, and the pebble taken up, could the "ill-wished" person escape the tenuity of the curse. In the customs attaching to these wells, of which Denbigh preserves one or two other examples, Mr. Thomas, the historian of St. Asaph, sees with probability the survival of heathen and pre-Christian rites. The gift of healing assigned to the majority of them owes its acceptance doubtless to the miracle in the Pool of Bethesda, whose five porches, as the same writer notes, are reproduced not only at Holywell, in the structure enclosing St. Winifred's, but also in the ruins of St. Mary's Well, at Wigfair, and of Ffynnon Asa, near Cwm and Ruddlan. On the whole, the churches of Denbighshire and their surroundings, in the shape of crosses, wells, and incised tombs, create a favourable impression of the piety and munificence of the county, though it must be owned that in one or two churches—Ruthin and another—the numbers of mural tablets of brass with pedigrees and arms have a vainer air, and suggest the idea that the coffin-plates have been nailed to the walls by an afterthought.

Apparently the vale and its sides have ever been a congenial soil for timber, for in Denbigh and Ruthin there are not a few old timbered houses of considerable interest, and, apart from the parks about Denbigh and St. Asaph, we come upon fine oaks, wyches, and ash in other parts of the county. In the circumscribed valley around Ffynnonlaur are some very fine wyches, and, we fancy, walnuts. By the bridge over the Elwy at St. Asaph are some equally fine; in the moat around Ruthin Castle grow ash-trees fourteen feet in girth at five feet from the ground; and there are, or were till of late, three chestnuts, at Bachymbyd, the representatives of the daughters of Sir William Salusbury, and the memorials of the marriage of one of them with Sir Walter Bagot, into whose family the estate passed, the largest of which is thirty-five feet in girth, the smallest twenty-eight. Venerable yaws, as might be expected, are found in the churchyards. As to wool and corn also, the district is "potens ubere glebe," but it is perhaps more interesting that it has been ever strong in men, "terra antiqua potens armis." This is shown by historic and prehistoric memorials. The caves at Cefn have yielded to search, amidst the fossil bones of extinct animals, the fibres of so-called platenemic men, and a kist-vaen in the same parish opened in 1869 revealed traces of more than a dozen skeletons of similar form. In the parish of Llanarmon, four miles or so from Ruthin, sepulchral tumuli have been opened in two or three sites, and have furnished skeletons (a horse and his rider), skulls, innamed arches, and copper coins. Also on the hills between Nantglyn and Cerrigy-Druidion there are traces of a square camp presumably Roman, whilst at Pen-y-gwâr, the first tollgate on leaving the latter village, there have been discovered tokens of four distinct Roman roads. Elsewhere in the county there are divers British camps and tumuli; indeed "tomens" and mounds, kist-vaens and "cyttians," render the hills and slopes a most interesting field for the archaeologist. One thing which will strike the stranger is that a certain ubiquitous hero, Owain Glyndwr, has contrived to mix up his own history with almost every place of more ancient memorial; being met at starting on the conical fortified height of Castell Dinas Bran, a primitive Welsh castle above Llanfollen; at a tumulus called Sychart or Sychnant, half-way between that town and Corwen; at Corwen itself; and upon the undoubtedly British camp of Oaer Drowyn, on the opposite side of the Dee, as well as to omit many other places—at Ruthin, which he burnt and raided on a fair-day in 1400. He did the same, as his manner was, by the cathedral of St. Asaph, developing an evenly balanced talent for utilizing or destroying the works of others. There is not much to see of Ruthin Castle, or, as it was called from its red sandstone material, Castell Coch; a modern castellated mansion

having superseded a great portion of the ruins, whilst the gardens and terraces have modernized, not without taste and good feeling, the fosse and outer courts of the Edwardian Castle. Thus much at least may be said for it and Denbigh, as well as for the lovely ruin of Valle Crucis Abbey, that the present owners cherish what yet remains in the way of antiquity. It is quite otherwise in Flintshire, with Flint Castle and Basingwerk Abbey; so that those who compare what is now left with the drawings by S. and N. Buck in 1742, or with the later ones of Penant, will be puzzled to identify the present with the past. The site, breadth, and elevation of the ruins of Denbigh are grand and impressive, as if to match their history. The British "Craggy hill in Rhos" became the Dinbych or "hill-fort" of Prince David, Llewellyn's brother; and Henry I., Earl of Lincoln, erected the castle, of which we now see the ruined gateways and towers, after a grant of it to him from Edward I. It had a history and annals up to the restoration of Charles II., having passed into the hands of royal favourites and powerful nobles, and through the Mortimers into those of royalty itself. The old town, busy and alive still, has something of its ancient importance, though what would strike an Englishman as defective in civilization in its arrangements is that its booksellers' shops are out of sight and up passages.

To judge by two useful local handbooks—the Guide to the Vale of Clwyd by William Davis, and *Ancient and Modern Denbigh* by John Williams—the town and county have not lacked men of mark and merit since the building of the Edwardian castle. Great men from the Wars of the Roses to the Great Rebellion were the Myddeltons of Golech Hill and Gwaenynog; but none greater than Sir Hugh Myddelton, a cadet of the family in Elizabeth's reign, who in 1613 succeeded in bringing the waters of Amwell and Chadwell, in Herts, to London by the New River. His birth-place is still to be seen to the south-west of the old castle. Another native of old Denbigh, of Elizabethan date, also more famous in the arts of peace than of war, was Sir Richard Clough, a London merchant sprung from humble parents, but the partner of Sir Thomas Gresham, and the friend and patron of science and literature. Little has been said in these remarks of the women of Denbighshire; but our amends for the omission shall be to conclude with a story of one of them, connected with Sir Richard Clough:—

There was a portrait [says the author of *Ancient and Modern Denbigh*] of Catherine de Bernins, date 1598, at Llewenni. She wore a locket (said to contain the hair of her second and favourite husband, Sir Richard Clough) suspended to her neck by a gold chain. She had four husbands, John Salusbury of Llewenni, Sir R. Clough of Denbigh, Morris Wynne of Gwydir, and Edward Thelwall. Tradition, always extravagant, has given the lady no less than seven husbands. It is said that when performing her last duty at the tomb of her first lord, she was escorted to church by Sir Richard Clough, and home by Morris Wynne of Gwydir, who expressed a wish to be her second spouse, and received the civil reply that his offer came too late, for, in going to church, she had already promised her hand to Sir Richard; but that if she should be called to perform the same melancholy ceremony over that gallant knight, he might rest assured that he should be her third Benedict; a promise which she afterwards honourably performed.

Few will deny Katrin y Borene's title to a foremost place in any history of the women of Denbighshire.

A HOUSE FOR NOTHING.

SO much is said nowadays about cheap food, clothes, and fuel, that perhaps it may be useful to consider how we may get a cheap house in which to enjoy those comforts. Speaking generally, our houses are very dear, as we pay their fee-simple value for an occupation of a few years; and yet builders and landowners possess, as regards many of us, a practical monopoly which no form of co-operation has hitherto been able to defeat. A little book lately published, bearing the attractive title *A Freehold Villa for Nothing*, proves on examination to be merely an ornamental treatise on the advantages of Building Societies, which were tolerably well understood before. The principle of these Societies, like that of life insurance, is sound; but we know how the latter principle has been abused, and people will not easily be persuaded that the former is not liable to similar abuse. Indeed, when we examine the chapter of this book which professes to answer objections to the system of Building Societies, we find an admission that their claim to confidence rests on the same footing as that of Insurance Companies, which are now so generally distrusted. "In these Societies, the characters as well as the names of the promoters, chairmen, secretaries, and directors should be ascertained, and their standing and reputation must form the chief guarantee for the ultimate success and well-being of the Societies." The guarantee here mentioned has been tried exhaustively, and too often found wanting. Men of "standing and reputation" have been made the tools of clever scoundrels, until it has almost come to this—that the more respectable are the names in a prospectus, the more suspicion ought to be excited by the scheme. Circumspection and caution are said in the book before us to be necessary in selecting and transacting business with Building Societies as in other affairs of life. Unhappily there are many persons so scantily supplied with these articles that they are obliged so to arrange their lives that there may be as little call for their exercise as possible. They are able to order a dinner, engage a servant, or take on yearly tenancy a house; but they do not feel themselves equal to judging of the prospects of a Building Society, and they have at least so much caution as to keep out of matters

which they do not understand. We are further told that the Society, for its own sake, will take some care that any building or purchasing scheme entered into with its money is not of too extravagant or speculative a character; but this is the most unstable of all grounds of confidence. Judging from ordinary observation, we should say that the principle of Building Societies has not been applied to anything like the extent that might have been expected; and the explanation of this reluctance may, we think, be found in the very pages which were written for encouragement. There are some certain, and other undefined or imaginary, risks. To those who cannot trust themselves to estimate these risks, the only alternative is to rely upon the character of the managers; and that reliance has been rudely shaken by the failures of great Companies during the last few years.

It must be owned, however, that this form of co-operation has received less attention than it deserved. On looking over the records of the last ten years, we do not find that Building Societies have largely occupied the attention of the Court of Chancery. There have been some cases which have been keenly litigated, but the legal decisions obtained in them have probably governed many other cases in which litigation has been avoided. The object of a Building Society is to raise a fund, by periodical subscriptions, for the purpose of enabling its members to purchase land and build houses. Some of these Societies aim at creating county votes, while others merely seek to provide their members with comfortable houses. When a Society has existed long enough to have accumulated a sufficient capital, it makes advances to members, who are chosen either by ballot or more frequently by tender. Suppose the terms of subscription to be such that at the end of fifteen years the accumulated capital could be divided so that each member would receive 100*l.*, and suppose that at the end of two years the Society is prepared to advance 100*l.* each to two or more members, then the members who offer to allow the highest discount on these advances are usually selected to receive them. In the case of an existing Society which is doing considerable business, an advance can usually be obtained immediately on joining it. A person who determines to buy a plot of land and build a house upon it goes to such a Society and takes as many shares as will entitle him to the advance which he requires. He is bound to repay this advance with interest by instalments extending over a certain number of years, and it is obvious that he is not in danger from any mismanagement of the Society, because he has received the money which he required, and he cannot be called upon to repay it otherwise than according to his contract. The liability on his shares is limited, and the consideration for this liability is a loan which he could not otherwise have procured. On the other hand, if he buys a plot of land in a good situation, and builds a substantial house upon it, the Society has good security for the advance which it has made to him. Thus the transaction is on both sides advantageous, and neither side incurs any uncertain liability. But it is obvious that such advances cannot be obtained to an extent sufficient to affect the supply of houses in the metropolis or a large town, unless there are many Building Societies in existence which have the disposal of considerable capital. But a considerable capital must be invested according to the judgment of a body of directors, who are probably directed by a secretary or manager; and we all know from the experience of ourselves or our friends what is likely to become of the capital under these circumstances. Further, the amount which each shareholder can subscribe to a Building Society is limited to 200*l.* under the Building Societies Acts; and although a larger Society might be formed on nearly the same plan under the Joint Stock Companies' Acts, it is very unlikely that, after all the experience of the last ten years, even clergymen and elderly ladies could be persuaded to hand over 100,000*l.* or so to a body of directors to be played with. The sight of a prospectus of a "Building and Investment Company, Limited," is enough to give one a cold shiver, and it would take some years of prudent and prosperous management to establish such an undertaking in public confidence; and that confidence would, in all probability, be ultimately abused. The history of Overend, Gurney, and Co. is that of many other firms and Companies. Years of thrift accumulate wealth and attract confidence, which are then recklessly destroyed and dissipated.

These are, we believe, some of the reasons why the inviting picture of *A Freehold Villa for Nothing* is unlikely to be realized in practice. There is a proverb that "fools build and wise men buy," and if a man at the outset of his married life thinks that he is likely to reside in the same neighbourhood for fifteen or twenty years, and if he can command the money to buy a freehold or leasehold house, he will do well to do so. But it is impossible to buy or build a house without money, and if a man has no money, he must either pay rent for his house or obtain the assistance of a Society or individual to buy or build it. The supposed owner of the freehold villa which cost nothing may be considered as a modern Robinson Crusoe. The adventures of that shipwrecked mariner are credible; and yet his successive escapes from drowning, starvation, and being eaten by savages form, to say the least, a combination of circumstances which in real life would be found exceptional. So "the good fortune to find a piece of ground for sale in the best part of the outskirts" of the town in which one lives does not occur to every person who would like to build a house. The imaginary author of the story found a friend to join him in a plan of building for each of them a semi-detached villa on this plot of land. They submitted their plans to a Building Society, and "through the kindness of the excellent President, to whom we

were both known," the plans were approved, and no objection was made to lending them the whole of the money they asked for. We fear that the kindness of an excellent President, however convenient to those who happened to enjoy the pleasure of his acquaintance, might have serious consequences to the institution whose destinies he guided. However, the two friends completed the purchase of the land, divided it equally, drew from the Society just the money required, and mortgaged the land with all they might put on it as a security for repayment. "A builder who worked with cordiality and good faith" seems to us almost as surprising and abnormal a creature as the benevolent President of a commercial Company, and we must remark that Crusoe met only one Man Friday among the savages. Then, again, the situation of the villa which was to be built for nothing was exceptionally favourable. It was in the best part of the outskirts of the town in which the owner lived, upon a broad good road, had been well drained, was well lighted with gas, and restrictions laid on the adjoining property prevented the erection of inferior houses, or the introduction of taverns, shops, or places of business. The owner and all his neighbours were prevented from building within a certain distance from the road, so that all the houses should have front gardens of the same depth. The land had not been laid out in even-sized plots with uniform houses, "like the melancholy-looking projections of some land and Building Societies." In fact, the situation was cheerful, genteel, and salubrious, with good roads, drainage, gas, and all other conveniences; and it was close to the town where the owner had to do his daily business. Such a combination of advantages could only be paralleled by

Some green Eden of the deep,
Where pleasure's sigh alone is heaved;
Where tears of rapture lovers weep,
Endeared, undoubting, undecieved;

and which Mr. and Mrs. Crusoe, together with the lady's boxes, might conveniently reach by steamboat built on the saloon principle, and carrying a good cook. We will not follow the author's description of the villa, because the feelings of an angel who surveys a paradise which he cannot enter are disagreeable. It is possible, however, that Satan might have found some fault with Eden, and the mention of "two cisterns supplied with the Company's water" is suggestive of sickness, to be followed by scientific analysis which would discover an undue proportion of organic matter in this water. This apprehension would be more serious, because if the site were far removed from "taverns, shops, or places of business," there would be almost no facility for substituting mild beer for suspicious water. We had forgotten to mention an advantage which even Mr. and Mrs. Crusoe on their island could not enjoy—namely, that "the most fashionable church of the district" was visible from the drawing-room window of the villa. The villa was built and furnished to the entire satisfaction of the owner; he lived in it or let it for fifteen years, and the rent during that period exactly repaid the Society's loan, with interest. Thus the author of the story got his house for nothing. But if the proverb above quoted be true, it is to be feared that the more common experience of amateur builders is to get nothing corresponding to the outlay for a house.

ART AT THE VIENNA EXHIBITION.

VII.

WE propose now to give some account of the old and historic works scattered about the Galleries. The assemblage, though much less systematic and complete than the "Loan Collection" in London in 1862, and the "Histoire du Travail et Monuments Historiques" in Paris in 1867, is not without a value of its own. The period of time comprised is as wide as the styles of art illustrated are diversified. Here are pre-historic remains, Etruscan, Roman, and Byzantine works, Italian, Gothic, Renaissance, and still later products, severally identified with the local history of Germany, Hungary, France, Italy, Switzerland, Denmark, Norway, Sweden, and Russia. The want of arrangement, chronological or other, and the absence of a catalogue render a description of the collection all the more difficult. We must content ourselves with a transcript of notes made on the spot.

The Vienna Exhibition shows a large area of Europe occupied by pre-historic remains. The contributions from Switzerland are specially numerous; the several ages of Stone, of Bronze, and of Iron receive illustration by many hundred specimens. Denmark and Scandinavia give but slight proof of their unexamined treasures; the unsurpassed National Museums of Copenhagen, Christiania, and Stockholm do not appear to have been put under contribution. Italy, chiefly known for highly developed arts, now shows what her people were doing in primeval periods; the "Regia Università di Roma" exhibits flint implements from Perugia, Todi, Nepi, and Palermo. Also an account is published with illustrations of the pre-historic monuments of the Stone age in the Archaeological Museum, Ancona, collected by the Commission for the Preservation of Monuments. Passing to Germany, the materials at command for the elucidation of these dark periods appear to be all but exhaustless; the two great Museums at Mayence and at Pechel are remarkably rich in pre-historic remains. Pechel sends to Vienna a small selection from "the Prehistoric National Museum." Her antiquaries claim for stone implements and works in metal, exhibited from Hungary, or other distinctive characteristics. The Stone

epoch is said to be allied to that in Switzerland. Advancing onwards to the Metal period, at first copper appears to have been used in Hungary in place of bronze. A lump of tin has been found which belongs to a time when that metal was not known save in the Scilly Islands. Coral also has been met with in Hungary, which is supposed to have come from the Red Sea; a fancied connexion is even traced with Mexico; but this last conjecture, we suppose, must be set down to that spirit of romance from which Hungarian antiquaries cannot be held to be exempt. Herr Franz von Pulszky, who kindly places his personal knowledge at the disposition of any truth-seeking tourist, states that the Bronze period in Hungary lasted till the time of Augustus; the immediately succeeding age of Iron is fitly identified with the coming of the Romans. In Vienna it has been made more than ever evident what valuable material Hungary offers to the student of historic monuments.

The Exhibition affords abundant evidence of the supremacy of the Romans in Germany; the Central Museum in Mayence and the National Museum in Pesth are the chief repositories of these "Römisch-Germanische" remains. The former is represented by casts coloured as facsimiles; from the latter come a few original works, among which is conspicuous a unique Roman vase in bronze, inlaid with gold and silver. This gem was discovered in 1832 near the Hungarian town of Oedenburg, an important Roman station south-east of Vienna. On the same site many other Roman antiquities have been exhumed. This small vase, or ewer, is exquisite in form and detail; there are standing figures of gold inlay; the ethnologic type, the art style, and the head gear are Egyptian; the period is supposed to be that of Hadrian—a time when Roman art fell under Egyptian influence. Roman remains have also been sent to the Exhibition from Gratz, the capital town of Styria, situated south of Vienna on the Semmering Railway; likewise some fine Roman bronzes come from the private collection of Herr Franz von Pulszky, director of the Pesth Museum. But, with comparatively few exceptions, the classic remains which have found their way to Vienna are provincial in character; the works produced in Germany under the Roman dominion naturally partook of the rude nature of the local art. And it would seem probable that pure products, such as the above-mentioned vase, belong to Germany, not as local manufactures, but as importations from the Roman side of the Alps. This distinction between provincial and imperial workmanship is borne out by a large mass of evidence. Thus "the Hildesheim treasures," of which there are reproductions in Vienna, are, in all probability, like importations; while, on the contrary, from Pesth come figures, not only of a degenerate classic style, but of an anomalous character, identified with local races and influences. Analogous hybrid styles are found in the Kertch and other collections of the Hermitage, wherein the foreign classic art has intermingled with the art indigenous to the soil. In the Pesth Museum a room is specially set apart to the "Völkerwanderungs-Periode." The strange mixture of races found to this day in the capital of Hungary has its counterpart in the art collection which reflects the chequered history of the nation.

The great historic Museums of Germany contribute to Vienna representative works belonging to the early revival or to the subsequent developments of Teutonic arts. Thus there are examples of the Romanesque, Byzantine, and Gothic periods in Germany. Reverting to the Museum at Pesth, we find contributions of that exceptional character which we are taught to look for on the Eastern frontier of the Austrian Empire. Among such remains some of the most remarkable are enamels both early and comparatively late. Of the former is a figure of Christ within a vesica piscis, surrounded by emblems of the four Evangelists; the types and the treatment are distant from those of Western Europe. There are also nine or more small enamels with figures, and encircling arabesques, fine in execution, and almost Eastern in tone and disposition of colour. Other examples verge more on Byzantine or Russian styles; of these are rich combinations of floral and foliated forms, the enamel being combined with filigree-work, diamonds, rubies, and pearls. These elaborate personal ornaments come from Transylvania, the easternmost province of Hungary—a country abounding in gold, silver, and precious stones, and peopled by mixed races who have long been skilled in the working of metals and minerals. Here then, again, we find complete correspondence between the outward conditions and the art products; the races are mixed, and so are the styles; the people were semi-barbaric, accordingly the decorative arts inclined to be gaudy and garish; the territory lies towards the Eastern frontier of Europe, and consequently we find in colour and ornamentation an approach to Turkish and Russian styles. In Transylvania this use of enamel may be traced back to the fifteenth century, and with modifications it subsists down to the present day in the form of showy and comparatively cheap jewelry. The contributions to the Vienna Exhibition are necessarily restricted; but we are informed of further acquisitions at Pesth which will enable the authorities of the National Museum to display a complete historic series of Hungarian enamels. The contributions from the other chief Museum of Germany call for but slight notice. The loans from Berlin are scanty; Prussia, in fact, in no department evinces much love for Austria. Two other Museums, one in Nuremberg, the other in Munich, which severally answer to the Hôtel de Cluny in Paris, not being able to spare original works, are represented by reproductions. The conclusion forced upon the stranger is that Germany is remarkably rich in remains reaching from Romanesque and Byzantine periods

right through the Gothic development. The treasures in the way of enamels, tapestries, stone, iron, and wood work already collected in Museums which are daily in course of further augmentation would furnish ample materials and illustrations for volumes similar to the French works of M. Viollet-le-Duc.

Nuremberg has placed in the Vienna Exhibition a statement as to the "Germanisches National-Museum" located in an old monastery within her walls. The purpose of the Museum is to illustrate, by means of historic remains, the life of the German people and the growth of civilization in the nation. The private life in past centuries is shown in domestic wood-work, metal-work, &c.; the religious life by church furniture and sacred utensils; the municipal and the intellectual life through archives of trading guilds, manuscripts, printed documents, &c. The Nuremberg Museum, like that at Kensington, is enriched by loans; it also opens its doors to periodic exhibitions, and is solicitous of friendly relations and reciprocity of action with other Museums throughout the world. The authorities, by means of a periodical publication, and also by an illustrated Catalogue, by engravings, photographs, and reproductions, seek to disseminate at home and abroad the knowledge of the Germanic phases of historic arts. The reason why all this is brought to the notice of visitors to the Vienna Exhibition seems to be that the Nuremberg Museum does not belong to Bavaria exclusively, but to collective Germany; in fact, this German Museum is supported by voluntary subscriptions and free gifts from separate States and private individuals, and subsists for the benefit of all Germans alike. The future of the institution appears to be assured by the increased support obtained. And when the other day on our return from the Vienna Exhibition we visited Nuremberg, after an absence of two years, almost the only institution which had moved onwards was this German Museum.

Italy is conspicuous in modern painting and sculpture, but she does not contribute many products of the middle ages. The examples of majolica and of Gubbio lustre ware are neither numerous nor remarkable. The Museum of Murano, through its Director, Signor Zanetti, makes a long statement for the purpose of showing under Group 22 how much it has served to promote art industry and to improve the general taste. This Museum was fitly established in Murano with the end of bringing together all works, old as well as modern, which might serve to illustrate or advance the art of working in glass, for which the island and its inhabitants are known to have been famous for centuries. When last we visited the Museum we found it to be well placed and wisely planned. It is right that the attention of Austria should be specially directed to the glass fabrics of Murano; no manufactures can possibly be more opposed than the vitreous products of Venice and of Bohemia here brought to Vienna in competition. The glass of Murano has certainly the advantage in historic antecedents; like other Italian products, it can point to a long pedigree.

The Loan Collections in the Vienna Exhibition contain even more than the usual amount of miscellanies. The Oriental works are less remarkable than might have been looked for in this Eastern capital. The ancient arms and armour in no way represent the resources of Germany; the Arsenal in Vienna and the Museums of Dresden and Pesth have assuredly not been impoverished in order to enrich the Exhibition. On the tops of the cases are ranged no end of mugs and pots of all ages and countries. More worthy of attention are two collections of coins. One is described in a ponderous volume entitled "Des Hohen Deutschen Ritter-Ordens Münz-Sammlung in Wien." Another case has, by way of explanation, attached to it a work treating of the "Fürstlichen Hochstiftes Olmütz Münzen und Medaillen nach der zu Kremsier befindlichen Sammlung verzeichnet und beschrieben." This last collection is specially rich in ecclesiastical specimens of the numismatic arts. Almost the only contribution from England is a case full of English silver belonging to the reigns of Elizabeth, Charles I. and II., of James II., William and Mary, and of George I. and II.

The Northern nations of Europe make themselves known as usual by curiosities which lie on the borderlands of barbarism and civilization. We would willingly have been spared, after the surfeit at South Kensington, any further display of the coarse peasant jewelry of Scandinavia. Such personal ornaments have about as much to do with art as the mock crowns worn on the itinerant stage of village fairs. Also rude, yet of exceptional interest, is a curious collection illustrative of the household industry of Sweden in the olden times. The needlework and the wood-carvings are primitive, almost barbaric. Here also are some of the notched calendars, an ancient mode of reckoning time and recording church festivals, which remained in use in Norway down to the eighteenth century. But in Vienna there is no carving comparable to the doors from the wooden church at Flaa of the twelfth century, sent from Norway to the great Paris Exhibition; in fact, it is only in the Museums of Copenhagen, Christiania, and Stockholm that one can understand the remarkable age of Wood which was coeval with the vast forests of Scandinavia. But these Northern nations like wise send to Vienna proofs that they not only passed through periods of Stone and of Wood but also reached an age of Gold. Yet what appears remarkable in the plaques and coins contributed is their non-local character. In the Museums of Christiania and of Stockholm are works in the precious metals as clearly belonging to Scandinavia as the greater part of the collection in Dublin pertains to the soil of Ireland. But the designs now seen in Vienna show classic and Byzantine influence; if the surface decoration can be clearly identified with Scandinavia, the Eastern or Southern origin of Northern arts would become something

better than a conjecture. But against this conclusion is the undoubted fact that some of the works bearing a classic or Byzantine impress which have been dug up in Scandinavian territory are nothing else than importations from afar. In Vienna at this moment the ethnology of the ancient arts might be worked out under peculiar advantages. The result probably would be an approach to greater unity than is commonly supposed. Still, however far back the investigation may be carried, the originating centres of art will in all likelihood remain as numerous as the national seats of civilization.

THE THEATRES.

THE clever actor who has undertaken the part of Richelieu is supported by a manager skilled in the art of advertising. The playbill of the Lyceum Theatre states that the profound impression produced on the first night of Mr. Irving's performance has been "subsequently endorsed by the enthusiasm of crowded and intellectual audiences." It is rather hard that we cannot bestow applause, which is certainly deserved, on this performance without being described as "endorsing" a profound impression. The manager's conception of an "intellectual audience" may be different from ours, but we believe that the use of American vulgarisms in speech is still avoided by educated Englishmen. We can imagine Lord Lytton's horror at being told that intellectual enthusiasm endorsed the impression made on the first night of his play. Perhaps we cannot better gauge the decline of the national theatre than by observing that Mr. Bateman, with his "archæological costumes" and his endorsements of profound impressions, has succeeded Mr. Macready as the manager who produces *Richelieu*. The play was brought out at Covent Garden Theatre in 1839. Mr. Macready took the chief part, Mr. Phelps took the small part of Joseph, Mr. Anderson, who is now acting at Drury Lane Theatre, was De Mauprat, and Mr. Elton was the King; while Miss H. Faucit performed Julio. The play was doubtless well put upon the stage; but the public of that day had not learned to accept "archæological costumes" as a substitute for a thoroughly efficient cast. It is satisfactory to see Mr. Irving advancing beyond the conscience-stricken murderer's line of business, and although we cannot say much for his supporters, it is at any rate a gain to art that he is put into a play which does not rest wholly on himself. The gentleman who performs the King has doubtless been engaged for the sake of a droll afterpiece, and it is not his fault if a portion of the "intellectual audience" take it as a joke when he tries to look serious. Julio addresses to the King an eloquent appeal for mercy to De Mauprat, her husband, which ends with the impressive lines:—

But spare this life, thus lonely, seethed, and bloomless;
And when thou stand'st for judgment on thine own,
The deed shall shine beside thee as an angel.

The King, "much affected," as the stage-copy of the play says, but not relinquishing his foul purpose, bids her annul her marriage with De Mauprat, and become the bride of Baradas. Julie, in despair, exclaims:—

Oh thou sea of shame,
And not one star.

Miss Isabel Bateman fairly sustained her part in this pathetic scene; and it must be admitted that Mr. Clayton is "much affected," and in "evident emotion" at the proper places. But unfortunately the result is something like that of seeing Mr. Belmore at the same theatre in *Oliver Cromwell*. That popular low comedian performed with commendable gravity, and indeed with entire propriety, the part allotted to him; and yet it was difficult to persuade oneself that he had not some comic purpose in cutting off the King's head. Mr. Clayton conveys, no doubt unintentionally, the idea that he thinks it a good joke that he should be playing such a part as King Louis XIII. at all; but as he must play it, his notion of the thing is, that the King, thinking Richelieu dead, was going to be jolly, and that it is an awful bore to find that he is alive. We have no fault to find with Mr. Irving's performance of Richelieu, nor do we think that it calls for extravagant commendation. The effort to make what are called points is stimulated in modern actors by the same condition of public taste as demands gorgeous decoration. The speech beginning

Then wakes the power which in the age of iron
Burst forth to curb the great, and raise the low,

is one of the finest in the play. The best actor and speaker of this, or any other time, might exert all his skill upon that speech, and although we might be powerfully impressed by it, we might not easily describe any particular tone or gesture; but we could easily describe, if it were worth while, Mr. Irving's attitude when he launches the curse of Rome. We should not refer to this passage particularly if it had not been selected by the critics for special laudation of Mr. Irving, and all we have to say upon it is, that Mr. Irving would do well not to strive too much for this species of commendation. He is a very clever actor who is trying to act Richelieu, but it might be possible for an actor less anxious to display his cleverness to show us Richelieu himself. Such acting as that of Mr. Irving in this scene is powerful in the sense that it calls forth vehement applause, which, however, comes from habit rather than from judgment. The manager virtually avows that he looks solely to Mr. Irving to make the play succeed, and the actor feels that he must come up to the great

occasion. Thus we get a straining after effect which is sometimes rather painful. It should be remembered that this play was not written for Mr. Irving, and that it contains more than one character. It was not perhaps easy to make more of the secondary characters, but it would be possible to make rather less of the character of Richelieu. If the original cast of the play be considered, it will appear that Mr. Macready did not take the entire weight of it upon his own shoulders.

Mr. Byron has written what he calls a new comedy for the Olympic Theatre. With sincere respect for a writer who has afforded much amusement to the public, we must say that almost all his plays are so alike that they leave no distinct impression on the mind. The only difference between this play, which he calls *Sour Grapes*, and others by the same hand, is that it contains fewer jokes; but, on the other hand, it contains many characters which are for the most part well sustained. Mr. H. Neville, who now manages this theatre, was for a long time a valuable member of the company playing the *School for Scandal* at the Vaudeville. He has enlisted in his new company Mr. Righton and Mr. W. H. Fisher, who will be long remembered as two of the original trio of the *Happy Land*. The weight of the piece rests principally on Mr. Righton, who as a barrister willing to improve his prospects by marriage or politics, is both witty himself and the cause of wit in others on the subject of his profession. All this, however, has been heard many times before. But an agreeable freshness is given to the play by the introduction of a West-country farm-labourer and his sweetheart. Mr. G. W. Anson, an actor new to London, amused the audience immensely by his rough talk and uncouth endearments, and he was well supported by Miss Emma Chambers. A well-known actress, Mrs. Stephens, has also a part in this play. Mr. Neville's own part is not much, but he helps to carry off the sentimental scenes. He deserves credit for collecting a good company, instead of trusting to himself or to any other single actor. His system of management is infinitely preferable in our view to that of the Lyceum, where everything is made to depend on Mr. Irving.

A remarkable play, ascribed in the playbill to Messrs. Tom Taylor and John Saunders, has been produced at the Globe Theatre. It is "a story of Lancashire industry," or, in other words, a dramatic representation of the substitution of machinery for hand-labour in cotton-spinning. Recent experience has inspired dread of plays founded on recent history, and particularly on that branch of history which may be called, to use a word of the day, "industrial." The vicissitudes of the life of Arkwright furnish, however, a subject capable of dramatic treatment, and Mr. Tom Taylor can scarcely help cooking well if only he happens to have any meat. It is matter of ordinary knowledge that Arkwright was by training a barber, and by choice a travelling dealer in hair, and that he invented or obtained for some time the credit of inventing a machine which was the foundation of the "industrial" prosperity of Lancashire as we now see it. It has been alleged, and probably with truth, that another person had invented a machine substantially the same as Arkwright's while he was a child. The history of almost all great inventions is in this respect the same. The minds of many men are travelling at nearly equal pace, and by slightly different roads, towards the same discovery. But Arkwright did undoubtedly reduce to practical shape the principle of spinning cotton by machinery, and he applied it so as, in spite of enormous difficulties, to realize a fortune of half a million for himself and to supply to other manufacturers the means of realizing countless millions. The first mill erected for spinning cotton by rollers was worked by horse-power; but afterwards water-power was used, and the thread was called water-twist as in the play. An association of manufacturers attempted to repeal Arkwright's patent, and involved him in costly litigation in which both sides were alternately successful, as usually happens when litigants are plentifully supplied with money. A clockmaker named Kay was produced as a witness upon the question of originality of invention, and a verdict was found against Arkwright upon his testimony. This story properly manipulated for stage purposes becomes the domestic drama called *Arkwright's Wife*. The travelling hair-dealer offers to buy the golden crop of a pretty girl whose father has reduced himself and her to poverty by neglecting ordinary work in pursuit of an invention for spinning cotton. After a little talk he offers to buy not only the girl's hair, but the girl herself, or in other words to marry her, and take her dreamy father to live with them at Bolton. He takes a hint from the old man's unfinished machine, improves it, and is on the road to fortune, when the old man, through jealousy, incites his daughter to destroy her husband's machine, telling her that this is the only way to save him and her from ruin. The picture which is drawn in several scenes of the poverty and distress incurred by many families in pursuit of the great invention for cotton-spinning is only too true to history. The rash act of the wife causes quarrel and separation, but only checks for a while the rising tide of Arkwright's fortune. A reconciliation is effected eighteen years afterwards, when Arkwright has become a knight, a rich man, and high sheriff of his county. The father-in-law, Peter Hayes, is obviously the Kay of history. This character is skilfully and strongly drawn, and it is acted most satisfactorily by Mr. Emery, who seems just now to be the Atlas who supports the Globe. The play was received with as much applause as half a theatre could supply. There are probably not many of the upper

class of paying playgoers now in town, but when a manager opens his theatre after the recess, we expect to find that it has been to some extent cleaned and decorated; and he would not, if he were wise, omit the process of "papering" the stalls.

REVIEWS.

SIR WILLIAM COVENTRY.*

SIR WILLIAM COVENTRY was a very distinguished member of Parliament and statesman in the reign of Charles II. During the first nine years of the reign he held important offices—Secretary to the Lord High Admiral (the Duke of York), and then a Commissioner of the Treasury, when, on the death of the Earl of Southampton, Lord Treasurer, in 1667, the Treasury was put into commission. The first office is described by Clarendon, who much disliked Coventry, as "very honourable under such a master, and in itself of the greatest profit next the Secretary of State, if they in that respect be to be preferred." He acquired in these offices a great official reputation, which was strengthened by the display of marked ability in the House of Commons. He was the life and soul of the Treasury Commission. "I perceive," says Samuel Pepys, on one occasion, "Sir William Coventry is the man, and nothing done till he comes" (*Diary*, August 23, 1667). When Coventry was removed, the Duke of Albemarle, one of the Commissioners, and not particularly friendly to him, said that nothing would now be well done at the Treasury (*Pepys's Diary*, March 10, 1669). He was chiefly instrumental in breaking the power of Clarendon, and preparing the way for his dismissal from office; but he was not implicated in the heartless malice and cruelty which aggravated his fall. He blamed Clarendon's mismanagements, but did not impugn his honour. Public opinion at this time designated him for the highest office in the kingdom. Bishop Burnet says of him, after Clarendon's fall, that "he was in a fair way to be the Chief Minister, and deserved it more than all the rest did." Coventry told Samuel Pepys that the Duke of Buckingham, who succeeded Clarendon in chief power, "did desire to join with him of all men in England, and did bid him propound himself to be Chief Minister of State, saying that he would bring it about, but that he, Coventry, refused to have anything to do with any faction" (*Diary*, March 6, 1669). This mad scapegrace, Buckingham, took it into his head to prepare a play to be brought out at one of the two public theatres, caricaturing Coventry. Pepys describes how Coventry was to be put upon the stage:—

They foolishly and sillily bring on two tables like that which he hath made, with a round hole in the middle, in his closet, to turn himself in, and he is to be in one of them as master, and Sir John Duncomb in the other, as his man or imitator; and their discourse in these tables about the disposing of their books and papers very foolish.

Coventry, on ascertaining this, sent the Duke of Buckingham a challenge. The King heard of it and interposed. Coventry was sent to the Tower, and his second, Henry Savile, his nephew and younger brother of Lord Halifax, also a Gentleman of the Duke of York's Bedchamber, was sent to the Gatehouse. Coventry was removed from the Privy Council and from the Treasury Commission. Thus the moral King desired to show his disapproval of duelling. But the indecency of the affront, and Coventry's high character, brought out public sympathy on his side. Sixty carriages a day brought friends to the Tower for sympathizing visits to Coventry (*Pepys's Diary*, March 7, 1669). The French Ambassador wrote an account of the affair to his Court, saying that the King favoured Buckingham, but that all men of character and consideration sided with Coventry. He was treated with unexampled severity. "He repeated to me," says Pepys, "many examples of challenges of Privy Counsellors and others; but never any proceeded against with that severity which he is, it never amounting with others to more than a little confinement" (*Diary*, March 6, 1669). This was partly, perhaps, from a well-meaning determination which the King had taken to put down duelling, still more, probably, from Buckingham's unhappy power over the King. Coventry was detained sixteen days in the Tower. His official career was at an end. He had long sighed for relief from the cares and worries of office. He loved more than business and politics his country home, Minster Lovell in Oxfordshire. He had great delight in gardening. He was a highly cultivated scholar, and versed in literature. Evelyn describes him as "a wise and witty gentleman" (*Diary*, October 17, 1659). Marvell calls him "Will the wit," in juxtaposition with his elder brother Henry, afterwards Secretary of State, who is "Hector Harry." He was united through life in the closest friendship with his nephew Halifax, who was twenty-three years older than the uncle. Coventry's reputation for ability led to his being supposed the author of Halifax's brilliant *Character of a Trimmer*. It is strange to see him declared the author of this work in the catalogue of Lord Bath's manuscript treasures at Longleat, in the Third Report of the

Historical Manuscripts Commission (Appendix, p. 189). It is stranger, as the same collection of MSS. contains a letter from Sir William Coventry to his nephew, Viscount Weymouth, unequivocally denying the authorship. He owns himself a Trimmer, but denies that he is the author. The letter is dated July 30, 1685. After denying the authorship, he writes:—"I have not been ashamed to own myself, indeed, a Trimmer, not according as the Observer paints them, but (as I think the name was intended to signify), one who would sit upright, and not overturn the boat by swaying too much on either side." Lord Macaulay, mentioning that Sir William Coventry had been esteemed the author of the work, gives it, but with insufficient decisiveness, to Halifax.

Coventry's summary dismissal from the Treasury Commission was the end of his official life. The highest offices were often subsequently at his disposal, and he invariably declined them. He held a very high position in the House of Commons, where he spoke always with independence and authority. Bishop Burnet, speaking of his quarrel with Buckingham and its consequences, describes him as "a man of the finest and the best temper that belonged to the Court. And he upon that seemed to retire very willingly, and he was become a very religious man when I knew him. He was offered after that the best post in the Court, oftener than once; but he would never engage again." The notes of Lord Dartmouth and Speaker Onslow on this passage of Burnet are very valuable. The former says that Coventry "was the most esteemed and beloved of any courtier that ever sat in the House of Commons, where his word ever passed for an undoubted truth without further inquiry"; and Onslow says that, after quitting the Court, he "continued to attend the Parliament, acting a great part there, in very able though decent opposition to the Court measures." Public opinion expected him to be Lord Treasurer in 1673, just after Osborne's appointment. The so-called Cabal was out of joint, and it was believed that he and Halifax must be brought in to set matters right (Letters to Sir J. Williamson in Record Office). From a letter of Shaftesbury to the Earl of Carlisle, of February 3, 1675—a political manifesto of Shaftesbury as head of an Opposition—it is clear that there was a political overture to Coventry and Halifax in the summer of 1674:—"I am sorry my Lord Halifax had no better success in his summer's negotiation, and that his uncle, Sir William, could make no nearer approach to the Ministers of State than the kissing the King's hand. I fear it is fatal to his Lordship's uncle to go so far and no farther." This probably means that there was a formal reconciliation of Coventry with the King in 1674; it doubtless means that there was a question of Coventry and Halifax coming into office. Shaftesbury, lately dismissed from the Chancellorship, viewed unamiably the movements of his two near connexions, for Coventry was his brother-in-law and Halifax his nephew by marriage. Bishop Burnet thus describes Coventry's position in the House of Commons in 1675:—"Sir William Coventry had the greatest credit of any man in the House. He never meddled personally with any Minister. He had a perfect understanding of affairs. So he laid open the errors of the Government with more authority, because he nursed no passion nor puerile resentments with it. His brother usually answered him with much life in a repartee, but not with the weight and force with which he spoke." This brother was Henry, the Secretary of State. Speaker Onslow also says that Sir William Coventry chiefly debated with his brother Henry, "who was of a fair character in himself, and deemed the only honest Minister the King had since my Lord Clarendon."

Many years ago the writer of this paper had the opportunity of inspecting at Longleat an interesting correspondence, from 1667 to 1686, between Sir William Coventry and his nephew, Thomas Thynne, created Viscount Weymouth in 1682. A sister of Coventry had married Sir Henry Thynne, Baronet, of whom this Thomas Thynne was the eldest son. It is strange that this correspondence is not mentioned in the copious catalogue of the Longleat MSS., in the Third Report of the Historical Manuscripts Commission. A few extracts will show how interesting is this correspondence.

There was no meeting of Parliament for two years, between April 1671 and February 1673. Meanwhile England was embarked, by an unholy alliance with France, in war with Holland, and this war was ushered in by the flagitious Stop of the Exchequer and by the Declaration of Indulgence, a questionable exercise of royal prerogative for an intrinsically good purpose. Coventry's heart was now set on the relief of Protestant Dissenters. He writes, November 23, 1672, from his country seat:—

I was told before I came out of London that my Lord Archbishop [Sheldon] had promised never to consent to a toleration; well fare Minister Lovell! God send me health and quiet there, till our churchmen be wiser than to stand so rigidly and so much in their own light.

He found great difficulty in resolving to go up to London for the long-deferred meeting of Parliament in February. "To go up is to no purpose that I know, so long as our clergy are so stiff as I believe they yet are."

The Parliament sat from February 4 to March 29. The King was forced to cancel his Declaration of Indulgence. Sir William Coventry joined in opposition to the Declaration, and strongly urged a Bill for Ease to Protestant Dissenters. There was much sparring between him and his brother Henry, the Secretary. The famous Test Act was passed, excluding Roman Catholics from office, quickly followed by the resignation of the Duke of York, Lord High Admiral, and Lord Clifford, Lord Treasurer. Sir

* An Essay concerning the Decay of Rents and the Remedies. Written by Sir William Coventry about the year 1670. Ayscough Catalogue of MSS. in British Museum, 3228.

England's Appeal from the Private Cabal at Whitehall to the Grand Council of the Nation, the Lords and Commons in Parliament Assembled. By a True Lover of his Country. 1673. [Ascribed to Sir William Coventry.]

William Coventry prominently supported the Test Act. A Bill of Ease for Protestant Dissenters was introduced, was warmly advocated by Coventry, passed the House of Commons, and amendments having been made in the Lords, was ultimately got rid of by a prorogation designed for the purpose, while the Commons were debating the Lords' amendments. Coventry had in the meantime left London for Minister Lovell.

The following letter, written on March 31, when Coventry was evidently unaware of the final failure of the Bill of Ease, shows his importance at this time to the party of Opposition. An Act "for a most general and free Pardon by the King," hurriedly passed at the end of the Session, put an end to the designs of the Opposition, from which Coventry held himself aloof, for attacking evil counsellors:—

Yours of the 27th gave me no unpleasant entertainment by reading the last act of the popularity of this Session; a very brittle commodity, and whoever trades much in it shall find it so, and that he shall no longer believe himself to lead the House of Commons when he follows it. You won't think me an arrant Sir Pol. if I should tell you I foresaw somewhat like this which hath fallen out, that the country gentlemen had a good mind to fall on somebody, and that the grandees either had no mind to it, or durst not trust their followers. I am glad I was not Minister, or else I am sure I should have been blamed on both sides; one side would have blamed me for not assisting (it being work I love not), and the other would have suspected me for pulling it on underhand: for though I am the man in the world who deale the least underhand, yet those who hold themselves concerned to find always new faults in me would have pretended to believe it, as those grandees who are now so much blamed by their followers would have excused their not embarking upon my coldness in the matter. I am confident if I were amongst them I should be able to convince all my friends I did well to come away when I did, whatever want the Chambers might pretend of me.

And then he goes on to say of the Bill of Ease for Protestant Dissenters:—

If nothing be now done in it, one time or other it will be made an argument to call the Parliament when the great men at Court have a mind to play at foot-ball, especially now that by the Act of Free Pardon (if it pass) some will believe their stakes more secure than their neighbours. I did imagine, if an Act of Pardon had passed, none but my Lord Clarendon would have been excepted.

It was in this year 1673 that the remarkable pamphlet associated by general rumour with Sir W. Coventry's name, "The Appeal from the Private Cabal at Whitehall to the Grand Council of the Nation," was published. It is a pamphlet written with much wit and point, and shows an intimate acquaintance with foreign affairs. He spoke with equal freedom and equal fulness of knowledge in a memorable debate which ended by a refusal of supply on October 31, 1673 (*Parl. History*, vol. iv. pp. 596, 601).

A matter of some interest is effectually cleared up by a letter of Sir W. Coventry of August 11, 1685, five weeks after the battle of Sedgemoor, which crushed Monmouth's invasion. What became of Ferguson after the battle, and how he escaped, was a mystery. It has remained a mystery till now. Lord Macaulay says, "How Ferguson escaped was, and still is, a mystery." For some time after the battle he was believed to be lurking in London; and there were stories that he had been pardoned by James. There was no pardon. Sir William Coventry, writing on August 11, 1685, says that "Ferguson and about twenty others got to Zealand in an open boat." If Lord Macaulay had known this, he would have been spared a long discussion of conjectures and probabilities.

After the sudden dissolution, in August 1679, of the Parliament which met for the first time in the beginning of that year, Sir William Coventry declined to be again a candidate, and he retired to his books and his garden. He was not married. He was the idol of a large family connexion, and of a circle of eminent friends, among whom were Halifax, Dorothy, Dowager Countess of Sunderland, and the widowed Rachael, Lady Russell. He died on June 23, 1686, at the age of sixty. He left in his will two thousand pounds for the French Protestant refugees under the revocation of the Edict of Nantes, and three thousand for the redemption of slaves captured by the Algerines (*Lady Russell's Letters*, p. 338, ed. 1792; *Savile Correspondence*, p. 295).

Sir William Coventry was the youngest son of the famous Lord Keeper Coventry, who had been twice married, having one son by his first marriage, and a large family by the second. One of Coventry's sisters of the second marriage was married to Sir John Pakington, and is the reputed author of a celebrated anonymous work, the *Whole Duty of Man*. His elder brother, Henry, also of the second marriage, had a distinguished official career, and was universally loved. After holding several diplomatic appointments, one of which was a joint mission with Lord Holles to Breda, where they made the treaty which ended the first Dutch war, Henry Coventry was in 1672 made Secretary of State, and he continued to hold that office till February 1679, the eve of the meeting of Charles's new Parliament. Burnet describes him as "a man of wit and heart, of spirit and candour." Roger North, in the *Life of his brother, Lord Guilford*, says of Henry Coventry that "he had the nice step of the House, and withal was wonderfully witty, and a man of great veracity; he had never said anything in the House which afterwards proved a lie, and had that credit there that whatever he affirmed the House believed." In a time of tricksters truthfulness distinguished the two brothers. Burnet relates an amusing story of Henry Coventry's candour and reputation. Defending on one occasion a statement in the preamble of an Act of Parliament that England was at war with France, he declared that it really was so, and that he would rather be guilty of the murder of forty men than do anything to retard the war.

This strange expression exposed him to much railery. Colonel Birch twitted him with thinking the murder of forty men a small matter. "Coventry answered that he always spoke to them sincerely, and as he thought; and that if an angel from heaven should come to say otherwise (at this they were very attentive, to see how he could close a period so strangely begun), he was sure he should never get back to heaven again, but would be a fallen and a lying angel." Burnet winds up the story by saying that "now the matter was well understood, and his credit was set on a sure foot" (*Own Time*, i. 411, 442). Henry Coventry died a few months after Sir William, in December 1686.

Sir John Coventry, whose nose was slit in 1670 by a band of ruffian courtiers instigated by Monmouth, to punish him for an irreverent allusion in the House of Commons to the King's amours, was a nephew of Sir William and of Henry Coventry, being the son of the Lord Keeper's son by his first marriage. This memorable incident made a patriot-martyr of him, but he appears to have been little worthy of respect. Sir William, in his correspondence with Thomas Thynne, speaks lightly of him, ridicules his vanity, and wishes him out of the House of Commons, to be "out of harm's way."

Sir William Coventry had kept a journal; he showed it on one occasion to Samuel Pepys (*Diary*, March 9, 1669). What has become of this journal is not known. It might yet be to be found among the manuscript treasures at Longleat. The Catalogue, already referred to, of the Longleat MSS. makes no mention of this journal; but it is equally silent as to Coventry's correspondence with Thomas Thynne, Viscount Weymouth, and also as to a fragment of a History of the First Dutch War, which the writer of this paper has seen and made extracts from. A note to the Catalogue states that there are three large boxes full of Coventry papers, not yet examined. There can, we presume, be no doubt that the Marquis of Bath would cordially encourage an examination of them. It may be here mentioned that inquiry has lately been made of the Duke of Devonshire as to Lord Halifax's missing diary (see article, *George Savile, Marquis of Halifax*, February 22), and that his Grace has replied that it disappeared from the Chatsworth Library during the lifetime of the late Duke, and that several searches for it have been unsuccessful.

THE THRESHOLD OF THE UNKNOWN REGION.*

THE Secretary of the Geographical Society has in this handsome volume put forth in substance a manifesto on behalf of further Arctic exploration. That Englishmen should not abandon the task in which their ancestors won so much glory is at least the obvious moral from his book, and one which he is not slow to draw. In form, however, the book is a brief historical summary of what has been done by Arctic adventurers from the earliest times towards tracing out the long ice frontier of the unknown Polar region. The author, besides being qualified for his task by personal experience, states his facts lucidly and has made a very readable book. We shall not on the present occasion discuss the general arguments in favour of further activity; remarking only that they are set forth in this book with abundant force. One argument, however, which may perhaps be described as of the sentimental order, is brought out so distinctly that we shall venture to insist upon it at some length. It is not perhaps an unequivocal reason for risking lives in Arctic wastes that our remote ancestors showed us the way with greater courage because with infinitely inferior resources. And yet it is impossible to study the records of ancient daring without desiring that the existing race of English sailors may have a chance of showing themselves worthy of their origin. It is, after all, of some importance to maintain in the navy a continuous tradition of heroic enterprise. In times of war our ships will owe much to the memories of Nelson, Blake, and the conquerors of the Armada. The sentiment will be maintained in the greater force if some outlet is provided for the adventurous spirit in times of peace. Our ancestors ventured into the Polar seas in their cockle-shells of boats to find shorter commercial routes, or to discover new sources of wealth, and we are invited to follow them in the name of science; but, whatever be the pretext, the simple aim of showing that the spirit of manly enterprise is not dead amongst us will seem to many to be of itself a sufficient excuse.

Let us then recall from the volume before us some of the old performances which we are challenged to emulate. The old sailors were not much in the habit of picturesque writing; and when Hudson or Barents came home from their voyages they did not publish sensational accounts in beautifully illustrated volumes. Fortunately, however, they left records sufficient to enable us to fill up the bare outline with the aid of more recent investigations; and frequently the accuracy of their reports has been proved to a degree which is surprising when we consider the rudeness of their instruments. One of the earliest adventurers was Stephen Burrough, who sailed from Gravesend in the year 1556 in a pinnace called the *Sorchthrift*. Old Cabot, whose labours had begun nearly sixty years before, came to see them off, accompanied by "divers gentlemen and gentlewomen." He gave them a banquet "at the signe of the 'Christopher,'" and afterwards "entered into the dance himself amongst the rest of the young

* *The Threshold of the Unknown Region*. By Clements R. Markham. Q.B., F.R.S. London: Sampson Low & Co. 1873.

and lusty company." Burrough discovered the strait between Nova Zembla and the island of Vaigats, but was driven back by unfavourable winds, by the darkness, and by "the great and terrible abundance of ice." Two ships, the *George* of forty and the *William* of twenty tons, followed up this discovery in 1580, and, after finding the strait between Vaigats and the mainland, were beaten back, in spite of desperate efforts. The *William* was lost in an attempt to reach Iceland, and we may sympathize with Milton's view that these early enterprises "might have seemed almost heroic, if any higher end than love of gain and traffic had animated the design." We may, indeed, give them credit for some perception of a higher end, for the instructions given by the Muscovy Company said that the discovery of a passage would not only prove profitable, but would "also purchase perpetual fame and renown both to you and our country." These daring adventurers found a worthy successor in the Dutchman Barents. In his first voyage he sailed for seventeen hundred miles along the edges of the pack-ice round Nova Zembla, and had to put his ship about eighty-one times. He tried in vain to force his way through every promising opening, and made a series of observations of remarkable accuracy. In his third voyage he attempted to find an opening by keeping nearer to Spitzbergen, and, after failing, returned round the North-Western end of Nova Zembla. After many gallant efforts, he was finally frozen in during the winter of 1596. The seventeen brave Dutchmen built a house on the shore with driftwood, fixed a clock against the walls, and converted a wine cask into a bath, which, as we are rather surprised to find, was judiciously recommended as a sanitary measure by the surgeon. A quaint woodcut gives a clear representation of this earliest specimen of Arctic winter-quarters. The adventurers escaped in the following summer in two open boats, though poor Barents, like Captain Hall, died before he could tell his own story. The house in which he had lived remained unvisited, it is said, for 278 years (our arithmetic, we may remark, makes it 274), when a Norwegian, Captain Carlson, visited the spot in 1871, and found everything left precisely as it had been represented in the account of one of Barents's companions. The old clock was still standing against the wall, and the muskets and halberds were found in their old places. There were an old manual of navigation and a Dutch translation of Mendoza's *History of China*, indicating the object of the adventurers' travels. There was also a curious copper dial, said to be probably the only extant example of an invention for calculating the longitude by Plancius, "the famous cosmographer and tutor of Barents." There were a flute, which still gives out a few notes, and a pair of little shoes belonging to a ship's boy who died during the winter. The relics are not quite so interesting as those which have been discovered at Pompeii, but there is something pathetic about them in a humble way.

A celebrated navigator, Henry Hudson, carried on Barents's work with characteristic audacity. It was in 1607 that he sailed from Greenwich, "in a craft about the size of one of the smallest of modern collier brigs," with twelve men and a boy, intending to sail across the Pole to Japan, and, indeed, getting as far on the way as has been done by the best equipped modern expeditions. In this and in a later voyage he examined the edge of the pack-ice along the whole line from Greenland to Nova Zembla. On one occasion he forced his way several leagues into the ice, but was finally obliged to return, as every subsequent adventurer has been obliged. Hudson's discoveries led to a great whaling trade, which flourished for a century and a half, and gradually passed from English into Dutch hands. He proved that the icy barrier stretches continuously from the shores of Siberia to those of Greenland; and all subsequent experience has gone to show that it is impassable in ships. Parry's great attempt, indeed, in 1827 to reach the Pole by sledges from Spitzbergen suggests that it may be possible to do something more by this means; but the more promising route by Smith's Sound appears to offer far greater chances of success. Meanwhile, however, there is another curious story of still earlier adventure in the same region where Hudson's efforts had been frustrated. Two Venetian gentlemen named Zeno made a voyage in the Northern seas, at the close of the fourteenth century. One of them wrote a complete record of his adventures, which had a singular fate. A descendant of his, born in 1515, tore it up when a boy, not knowing its value; but he afterwards put together a narrative from some remaining letters, which appeared at Venice in 1558. Unluckily this editor entertained a perverse view of editorial duties not yet so extinct as it ought to be. He found an old map, rotten with age, and set about supplying its defects from his own interpretation of the narrative. The consequence was that he threw the whole geography of the region into hopeless confusion, and thus deprived his contemporaries of much useful knowledge, though we are now able to distinguish the genuine facts from the errors with which he mixed them. We are thus enabled to identify the site of the lost Greenland colony, from sailing directions which are preserved as to the right method of coasting it, and from indications as to the site of an old monastery. The most interesting part of the information which comes from the old explorer is the report of certain fishermen who had discovered America. They found Latin books in the possession of some of the chiefs, who could no longer understand them, and reported that the people made beer and had a certain amount of intercourse with Greenland. This information is sufficiently scanty, but goes to confirm what we know of the old Scandinavian colony in America. The whole subject has been investigated by Mr. Major, who is about to publish his conclusions in an edition of the voyage

of the Zeno, to be issued by the Hakluyt Society, and in a paper in the *Journal of the Geographical Society* for 1873.

But meanwhile we are diverging from the track of Arctic discovery. The expeditions through Baffin's Bay have been more fruitful than the efforts of the brave men who vainly charged the edge of the huge ice-pack between Spitzbergen and Greenland. John Davis was the pioneer of this route. He was shocked by the sight of Greenland, remarking that "the loathsome view of this shore, and the irksome noyse of the yce, was such as it bred strange conceites among us." However, he found the straits which bear his name in 1585, and made known the existence of a wide opening. His only successor, during two centuries, was William Baffin. Baffin forced his way through the Melville Bay ice and reached what is known as the "North water" in twenty-two days, a time which, curiously enough, appears to be just the average time of passage for modern whalers. From 1616 to 1817 nobody followed him; but in the last-named year a couple of Scotch whalers repeated his feat, and found so many whales that the same feat has since been repeated every year. Ships have, indeed, suffered occasionally in the performance. The year of evil celebrity is 1830, when nineteen ships were destroyed by a gale which suddenly drove masses of ice into Melville Bay and nipped the whole fleet against the land-floe. There is, however, as we are carefully informed, no special risk to life when a ship is thus suddenly crushed to atoms in the Polar seas. The retreat in boats to the Danish settlements is "perfectly safe and easy." In 1830 a thousand men were encamped on the ice, the tents were a scene of "joyous dancing and frolic," and the season was long remembered as the year of "Baffin's fair." Discovery ships, too, are better provided for such adventures than whalers; as is proved by the fact that explorers have passed the Melville's Bay ice thirty-eight times, and that no ship has yet been lost. * A "good nip," as it is facetiously called, causes only a little pleasurable excitement. Indeed the wild Arctic scenery, with the fun of cutting docks and blasting the ice, is so pleasant that the Melville Bay detention is "a most enjoyable and exhilarating time." The whaling fleet from Dundee, which annually indulges in this amusement—for so, it seems, we must call it—is excellently prepared for the purpose; and we may infer that, with proper precautions, we may do with modern steamers what old Baffin did in a little craft of 55 tons with no more fear than we feel in taking an express train to Scotland in the midst of the excursion season. The ice collapses as easily as a train of excursionists, and with infinitely less risk to the assailant.

The route by Smith's Sound is connected with the names of American adventurers, who appear to have shown the national spirit of enterprise by venturing in ships little better prepared than those of the earlier explorers. Kane made the first attempt in the year 1853 in the *Advance* of 120 tons, with a crew of seventeen men, the same number as that in Baffin's *Discovery*. His experience, and that more recently acquired by Hayes and by the *Polaris*, point the way to future explorers. Captain Hall reached without difficulty the highest latitude ever attained in a ship, and within thirty miles of the most northern point ever reached by civilized men. The distance from Hayes's Cape Parry to the Pole and back is 968 miles, a distance which has frequently been exceeded by Arctic sledge parties. McClintock once performed 1,210 miles in 105 days, and Mechem went over 1,157 miles. In short, a couple of stout steamers, manned by properly disciplined crews, and placed at the point reached by the ill-found American ships without serious difficulty, would be within striking distance of the Pole. We venture to hope that the prospect will be realized, and that the adventurers may be Englishmen, encouraged in their task by the desire to show themselves worthy of descent from the Burroughs, Hudsons, Davises, and Baffins of a past generation. Of the additional reasons for desiring such a consummation, of the scientific aims to be realized, and the real extent of the dangers to be encountered, a full and judicious account will be found in the book before us.

PRUSSIAN OFFICIAL HISTORY OF THE WAR.—PART IV.*

THE new section of that which is best known as the Moltke Narrative carries the reader into the very heart of the terrible contests before Metz, the last scene of which is even now being worked slowly out in the great room at the Trianon. It will have for many readers an interest greater than even that which attached to those picturesque details of Spicheren and Woerth which have made so finished a work of the Third Part. For Count Wartensleben—it is no secret that he is the accredited successor of Colonel Verdy—has now reached in his work those great strokes of strategy to grasp the outlines of which is more easy to the layman's mind than to follow the comparatively intricate details of actions; as indeed to delineate the former clearly is the most straightforward part of the task of the military historian. That is, supposing that he is gifted, like M. Thiers, with a genius which enables him to pierce, as it were, inside the intent of the original design; or that he has the advantage, like Count Wartensleben, of access not merely to all official documents, but to the presence and confidence of the designer himself. And we must note here once more our entire satisfaction with the general spirit of the new history as compared with that of the war of

* *Der deutsch-französische Krieg 1870-71. Von der kriegsgeschichtlichen Abtheilung des grossen Generalstabes. Erster Theil, Heft 4. Mittler: Berlin.*

1866. The reason of its superior frankness, not to say honesty, is obvious. It is no doubt an easier, as well as a more pleasant, task for a German military writer to follow out the stages of the national duel with the *Erb-Feind*, the hereditary foe of united Germany, than to put a fair face on the mixture of daring and craft by which Prussia succeeded in wresting the supremacy of Germany from internal rivalry. Hence no doubt the absence in these volumes of that appearance of special pleading which is an acknowledged drawback in the Berlin General Staff History of the War of 1866.

Let no one say after the perusal of this volume that Marshal MacMahon has never shown any strategic power. What it was that decided him, after his shattering defeat at Woerth, to retire so instantly behind his former right by the cross-roads leading south over the foot of the Vosges to Saverne, instead of falling back to his original rear westward along the French frontier, cannot be exactly stated. But, whatever it may be that leads a general to the right choice in so desperate a juncture—his army almost broken up, and close to him a victorious and superior foe—he should have the full credit of the inspiration. And that the result of the battle of Woerth was not the total loss of the wreck of the beaten force, was undoubtedly due to the Marshal's prompt decision. It would have seemed the natural thing for him to go westward on Bitsche; for thus he would be retreating on the untouched corps which De Failly's blundering or remissness had kept from the battle; and thus too he would be moving towards the main Army of the Rhine, of which he had last heard only that it was in great force behind the Sarre. On the other hand, for the whole way in the march to Sarreguemines he must give a flank to an unknown enemy, who had been heard of as daily collecting to his north; whilst he would be followed by that Third Army whose superior strength he had so terribly proved. So he started off unhesitatingly by the less exposed road, and on the day after the battle moved so rapidly as to get clear of all that "touch" of the enemy of the constant exercise of which by their cavalry German writers are so proud.

And here we must turn aside to express a plain opinion that on this occasion the German leaders fell short of that great model of war whose teaching they have in so many points bettered. It is true that when night closed on the bloody scene at Woerth their troops had marched fast and far, and officers and men were overstrained with marching and with the fierce efforts which had crowned the evening with complete triumph. Still, the vanquished must have rested not far from them, and had no less need of repose. And the way in which MacMahon's relics slipped away from even the sight of their cavalry on the 7th, so completely that the flying Frenchmen never saw the Germans again till surprised by them amid the fatal hills and woods of the Ardennes three weeks later, seems to us the proof of a noteworthy shortcoming on the victor's side. It would hardly have been so with Napoleon—at least in his best days, before repented victory and the use of superior numbers had dimmed his vigilance and lessened his activity. His staff was not so highly trained as Count Moltke's, his cavalry officers were far less intelligent, his whole army was comparatively undisciplined, and at almost every point inferior to the German one of to-day save in the practical experience of war. But his power of leading men on was beyond anything witnessed in our time; and he would have hardly stayed inactive the whole day after such a victory as Woerth, as did the Crown Prince; or let his light troops "close their pursuit before the openings of the difficult mountain-passes," as we read that those of the Third Army did—those same mountain-passes being in fact good driving roads, so little impassable that MacMahon's flying column left no trace of itself sufficient to guide the pursuit. Even after the strain of Ligny, the last and hardest won of his many victories, Napoleon got his whole army into pursuit by 2 P.M. on the morrow.

Well was it for Marshal MacMahon that he trusted to his own quick decision and the fleetness of his men for escape by the most hopeful outlet. If the German staff was at this point of the war distinctly inferior in execution to the greatest of military examples, in conception there was no such lack of power. Why MacMahon might fairly be expected to retreat on Bitsche has been already pointed out. The first news of the complete victory of the Crown Prince suggested this probability to the great strategist who conducted the war for Germany; and he took instant measures to reap, if possible, a still more complete success to follow. At 6 A.M. on the morning after the battle the telegraph directed Prince Frederick Charles to cut MacMahon off, and pointed out the shortest way to the object—always supposing that the French were moving by Bitsche. This would send them along a line nearly parallel to and not far from the advance of the Second Army towards the middle Sarre. The IVth Corps, forming the left of Prince Frederick Charles, had halted at Alt-Hornbach, being well covered towards Bitsche with cavalry, which had been reconnoitring De Failly so closely as to give him his one excuse for loitering on the road to Woerth, in the presence near his flank of supposed "masses of the enemy." MacMahon could hardly be anticipated at Bitsche, which was but a single day's march from the scene of his defeat. But good roads led from the district where the IVth Corps lay to Rohrbach, a station further west on the Sarreguemines and Haguenau railroad; and, like Bitsche, lying also on the one direct *chaussée* through the hills from the field of Woerth to the Sarre. The Germans at Alt-Hornbach were as near this point at daybreak on the 7th as MacMahon himself could be supposed to be. Instantly, therefore, the IVth Corps was directed on it, Bredow's brigade of cavalry being specially attached to it to cover the movement; and all the

cavalry, with half the infantry of the Guard, were ordered to turn aside from the grand westward movement of the Second Army, and to march the same way, so as to support General Alvensleben, and ensure his corps against such a fate as that which overtook Vandamme when Napoleon threw him too rashly, with a similar object, into the rear of the allies retreating after the defeat of Dresden. Remembering no doubt the Frenchman's fate when thus exposed to the daring counter-strokes which made him captive on that occasion with his whole corps, Prince Frederick Charles hurried himself early in the morning of the 8th towards Rohrbach. General Alvensleben had accomplished his assigned task to the letter by the hour named. His corps was already planted in battle order, facing east, and ready to dispute the road if necessary against a superior foe:—"But the hostile army expected here from Woerth did not appear. Bredow's cavalry, spread far to the south, came nowhere on any trace of superior French forces. Instead of this, they met detachments from the Third Army. It then became clear that MacMahon's retreat had taken a southern direction." So says the official writer, briefly but clearly. In short, for once the great strategist's instinct had been at fault. MacMahon had escaped, outmarching one of his enemies, and anticipating the design of the other. Beaten as his troops were, they were not yet the "*canaille*" that their officers reproached them openly at Sedan for being, in the very hearing of their amazed enemies.

We shall not follow the official writer through his narrative of the retreat of the Marshal to Châlons, or that of Douay from his now exposed position near Belfort. Those who have read the valuable reminiscences of "A Volunteer of the Army of the Rhine," long since introduced to the English public in our columns, will remember his lively description of the extraordinary misconduct and mismanagement which marked everything connected with the VIIth Corps, its formation, advance, and retreat. The same authority has avowedly served as the foundation of the Moltke Narrative in describing Douay's proceedings; and probably a better could hardly be found. But it must be added that it is two years since we reviewed it in these pages, and that there are a number of more recent French works which might have been ransacked with good effect to throw further light on these and other such episodes in the fall of the Second Empire. There seems to be some small want of research visible here, which is certainly not characteristic of the writer's nationality.

Great part of the new section is devoted to the next scene of the war, the entry of the Germans into Lorraine, after their double victory on the 6th of August, and the collapse of the unhappy Emperor's attempt to check them on the frontier, announced to the surprised world in the now historic telegram "All may yet be recovered." Like resistless torrents of burning lava their three armies poured from the hills along the Sarre and entered the fine province which these had long barred from them, sweeping up its vast supplies of transport and forage. Simplicity and clearness were, as usual, the characteristics of the orders issued by Moltke to the three Commanders-in-Chief who worked out his design. They ran as follows:—

The news that is brought in leads us to think that the enemy has retreated behind the Moselle or the Saïle. All the three armies will follow this movement. The Third will take the road through Sarreunion and Dieuze, with those lying to the south; the Second that through St. Avold and Nomeny, with those to the south; the First that through Saarbourg and Boulay with those to the south.

To cover the march the cavalry is to be pushed to a great distance on, and to be supported by advance guards well thrown forward; so that in case of necessity the armies will have time to close upon each other.

When the situation in advance of the enemy makes it necessary, His Majesty will arrange [Steinmetz's previous wilfulness is presumably responsible for this strictness] for deviations from the lines of march indicated.

To-day, August 10, may be used by the First and Second Armies either for a halt or to arrange the troops ready for the march.

As the left wing cannot get to the Sarre before the 12th, the right wing will have but comparatively short marches to make.

How thoroughly the cavalry did their share of the allotted work, and what a new place they made for their arm in war and in military history, has become a matter of proverb. Parties of Uhlans, and of Dragoons and Cuirassiers that rivalled their lighter comrades in activity and daring, scoured every road far to the front and flank in a manner never witnessed before, paralysed all opposition by their audacity, and hung on the rear of every column and train of the dejected army of the Rhine. They crossed the Moselle before the peasants on its banks had even realized the fact that France was invaded. They dashed up to the gate of Thionville, and carried off prisoners from the very guard placed to hold it. They summoned Toul to surrender almost before MacMahon's rear had got clear of its walls. More than all, they established a moral prestige which for months to come left the inhabitants of the invaded districts helpless at the clank of a single sabre. Later indeed in the war the unexpected obstinacy of the defence of Paris, the energy of Gambetta, and, above all, the stern pressure of conquest, hardened the population into various forms of resistance, open or secret; but for the first part of the struggle any such thought seems to have been checked as it rose by the ubiquity of these small patrols of horse. The Prussian cavalry in fact had added another lesson to modern warfare almost as startling as the effect of the breechloader in the hands of the Prussian infantry four years before.

The last part of the volume before us is devoted to that action of the 14th of August, suddenly brought on close to Metz, known hitherto by the name of Horny, but now stamped officially with the cumbersome title of the battle of Colombey-

Neuilly. This affair, by causing Bazaine's army to check its movement to the west over the Moselle, and make a futile show of advance eastward from the fortress, contributed powerfully to its subsequent investment and capture, and forms one of the most important points in the strategy of that eventful fortnight which sealed the fate of France. Tactically too it is a remarkable study, and, like those of Woerth and Spicheren, is treated with thoroughness and vigour by the official writer. But for these very reasons it forms too large a subject to be dealt with at the close of an article.

THE EARL'S PROMISE.*

MRS. RIDDELL might have selected a better scene and subject for a novel than she has done in the *Earl's Promise*. The wrongs which Irish tenants suffered from their landlords long ago may have been a topic of enough interest to form the plot of a romance in the days when Miss Edgeworth wrote *The Absentee*, but they are rather a well-worn story now. It seems as if Mrs. Riddell had lately read up the history of those days, and been moved by it to a virtuous indignation which could only find a vent in scattering far and wide the picture of heartless oppression on the one hand and kindly submission on the other, in the pages of a three-volume novel. Now when a writer undertakes to point out some existing blot in the management of the world, or to call the world's attention to the lessons it has already received and ought to profit by, one of two results is very likely to happen. Either the production will resemble a blue-book interlarded with a novel, or, to quote Miss Edgeworth again, it will resemble those "moral tales," the moral of which was always lost in the interest of the plot. It is not easy to decide in which of these classes to place Mrs. Riddell's book. It reminds us at times of a proposal we have heard for publishing the business news of every week in the form of a novel, wherein the marriage of the hero and the heroine should depend upon their means, assured by the steadiness of gray shirtings or tottering with the fluctuations of water-twist. No doubt the ideas which the author wishes to force upon our attention are worthy of consideration, especially the assertion that all women ought to know more or less about illness; but this is dragged in so frequently, whenever indeed the health of any one of the characters is affected, that at last, like a frequently repeated stimulant, it loses its effect, and the eye passes over the words which convey it without carrying their import on to the brain.

It will be evident from these observations that the *Earl's Promise* cannot be called an artistic book; indeed the promise which gives the novel its name—a promise of a renewal of lease to a deserving tenant—only remotely affects the principal characters, and affects the heroine only so far that its results give her the opportunity to show herself worthy of the place she occupies. There is a want of cohesion and consistency throughout. We find in the first few pages a picture painted in strong contrasts of the heartless, gracious-mannered Earls of Glendare spending their money in Paris and in London, and of tenants making up that money with the heart's blood of patient men and the tears and souls of hopeless women; and but a few pages later we hear of work done fairly and wages received regularly by these same patient men, who are light-hearted enough to veil their necessity for work with a convenient fiction of their doing so for pleasure or "to oblige the master." So in the case of Mr. Moffat, an English resident in Kingslough, which is the main scene of the book, we are told in one place that he had never been able to win for himself popularity, not understanding the tricks of manner and word by which it is bought; and when this fact is well established in the reader's mind, and he is prepared to see all sorts of appalling events follow as its natural consequence, he is startled by suddenly hearing that this man was "on the whole popular, and specially liked among the Glendare tenantry." This, amongst other things, is a symptom of careless work—a sign that the writer, eager to discover an anti-thesis to the shallow and cruel, but popular, Glendare family, found Mr. Moffat ready to her hand, and clapped him into the empty place to represent sterling unpopular uprightness. But the moment that he is wanted to pay a visit to a farmer's wife and fall into pleasant conversation, so as to draw out the story of the promise, he must needs be pulled out of his garment of forbidding manners as fast as he was put into it, and invested with a gentlemanlike civility which wins him favour everywhere. This is a sort of treatment we may expect to be applied to the merest supers, but not to such a character of Mr. Moffat, who, when he has lived down this trifling discrepancy, is a lifelike and not unimportant personage. It is perhaps natural, when there is a continual demand for new stories, that people who can, like Mrs. Riddell, write very readable novels, and are thus sure of commanding an audience, should take but little pains in finishing their work, and should allow it to fall into the slipshod, careless ways which are now so much the rule in writings of fiction that we always expect to find them predominant, unless the name attached to a book bears a warrant to the contrary. But because it is natural, because there is a continual tendency in that direction, for that very reason should those who have the power to do so stand against the stream of wacky, ungrammatical English—a stream powerful only by its ever-increasing volume, or we should rather say volumes—and check by the example

of their steadfastness the crowd who hasten to fling themselves headlong into the current to swell its sickly torrent. That Mrs. Riddell can write good nervous English, free from any taint of imitation, there is ample evidence in the pages of the *Earl's Promise*; yet she chooses to give way at intervals to writing sentences which are faint echoes now of Dickens, now of Thackeray. She makes use frequently of a disagreeable and questionable adverb; she talks of "reliable" information; her characters, whenever they make statements, mentally add something to them; they do not reflect or think, but mentally say things to themselves; on one occasion a whole community "mentally counts" a man's inheritance—as if people carried black boards and chalk about with them, or met in the marketplace to compare the results of their labours in arithmetic. Even thus the process of counting could scarcely be gone through without some mental exertion. And in one instance Mrs. Riddell descends to the lowest depths of present-day novels, and describes a girl with that most recklessly squandered possession, "a wealth of golden hair."

The plot, too, is ill constructed. As has been said, what we should naturally regard as the principal motive of the book, the promise made by Lord Glendare to Amos Scott, of a renewed lease of Castle Farm, does not come into notice till the conclusion of the first volume, and has very little to do with the working of the story till the winding-up approaches. The end involves a sudden revelation of extraordinary conduct, ending in manslaughter, on the part of a clever young doctor, who till then has given no sign of evil tendencies, beyond the fact that he is a confirmed Radical. A singular chain of circumstantial evidence is brought to bear against Amos Scott, quite as wonderful as that which dragged the innocent Lesnques to the scaffold, in the celebrated *Courrier de Lyons* case. It is followed by his subsequent discharge from custody, due to the exertion of mysterious "influence," without any proceedings being taken against the real murderer. All this is compressed into the lag end of the last volume, and hurried through towards its conclusion as if the circumstances were not worth explaining, and could be easily filled in by the imagination of the reader.

Many of the characters are well drawn, but for the most part they appear and disappear with the rapidity of theatrical visions, or of patterns shifting in a kaleidoscope, as if the author, having once brought them on the scene, had then no thought but for the best and speediest way of carrying them off it. This may be due to a fear of being tedious, to a desire to keep the reader amused with a continual variety of incident and character; but, in truth, any appearance of haste or dissatisfaction on the part of a writer is certain to produce a corresponding or more than corresponding impression of incompleteness in the mind of the reader. The author who fails to preserve and clearly point the relative importance of his fictitious characters cannot expect the reader to choose for himself from a mass of equally interesting scenes those which ought chiefly to command his attention. Thus in reading the *Earl's Promise* we are at one time convinced that the misfortunes of Nettie and the plots of her blackguard husband Brady are the main events of the story; at another we find that we ought to be far more concerned about the fate of Grace Moffat, who is indeed the most constantly present and the most steadily interesting personage of the story. It is a satisfaction to find that she does not after all marry the wrong man, Mr. Robert Somerford, and does, as a sort of necessary corollary, marry the right one, John Riley, although this is a piece of good fortune which, in spite of her many virtues, she scarcely deserves, considering the cruel manner in which she jilted him in the beginning. John Riley, although he only appears at the commencement to set the machinery of the plot in motion, and at the end to stop such wheels as are going wrong and obtain Grace as a reward for his voluntary exile in India, is a pleasant specimen of a practical, honourable young man, devoid of those graces which enable his rival Somerford to throw a glamour over Grace for a time, but possessed of far better things in their place. Somerford is one of the best drawn personages. Mrs. Riddell has portrayed in him with considerable skill a type of character which is not very uncommon, but to grasp which requires unusual powers of perception. He is a man universally beloved by reason of that Stuart-like graciousness and charm of manner which was, as the author tells us, a peculiarity of the whole Glendare family—a man of such complete selfishness that he only wanted a little more brains to rise to any eminence. What Mrs. Riddell says of him is true of many people:—

Unknown to himself, perhaps, but still, certainly his whole life was a lie—an assumption of qualities he did not possess—of abilities with which nature had not endowed him, of affections forgotten at his birth. It was what they believed him to be, and not what he was, that the lower classes loved.

His part in the scene where he finally jilts Grace Moffat is excellently true to his character of over-conscious falseness, but here is not equal to it in point of merit. A girl of her sensibility and dignity would scarcely have given so strong a hint of her feelings to a man of whose affections she was far from sure, and whose sincerity she had already begun to suspect. Mrs. Hartley, the Englishwoman resident at Kingslough, is also a well-drawn character, and a very pleasant one; and it is a pity that she should only appear as a sort of *deus ex machina* whenever either Nettie or Grace Moffat is in trouble. Grace's visit to her in England some time after their personal intercourse has been interrupted, and the difficulty experienced at first by both in resuming the old intimate relations, is especially

* *The Earl's Promise*. By Mrs. Riddell, Author of "George Geith," "Too Much Alone," &c. 3 vols. London: Tinsley Brothers. 1873.

well touched; and so is the scene in which the ice is broken between them and Grace confides her trouble to her old friend. This is soon followed by the news of Brady having been murdered, by Amos Scott as it seems; and Grace thereupon undertakes a journey to Ireland, as much to see what can be done for Scott as to comfort Mrs. Brady in the time of her loss—affliction in the case of such a husband it could scarcely be called. Then arise the complications we have spoken of above. Mrs. Brady displays an amount of misery which is quite unaccountable until she lets out the truth in the delirium of a fever, and Grace, going straight to the young doctor Hanlon, finds him ready to confess. That a person of his discrimination and common sense should not have done so at once, when there was every chance of his story being believed and no chance of any stigma resting upon him for the unforeseen result of a blow struck in self-defence at such a ruffian, and such an unpopular ruffian, as Brady, is a remarkable circumstance. It is not more so, however, than the inconsequence of the events that follow; the want of sufficient explanation for Scott's instant abandonment of the Castle Farm, his attachment to which has caused him so much suffering, and for the very little that the Earl's promise has to do with the whole thing.

THE PRAISE OF PEDIGREES.*

THE different ranks of society have in turn been the favourite range of novelists. Some prefer high life, others low. Satirists have quizzed the follies of the great or laughed at the vices of the poor; more cheery writers have made us at home on the fore-castle or in the mess-room, or have even drawn food for mirth from the dead-alive dullness of a cathedral town. Sir Bernard Burke, however, has been cleverer than any of these, for he has filled volume after volume with the least possible amount of trouble to himself, by simply ringing the changes on the old well-worn parable of Fortune's whirling wheel, which has for ages given a theme to the pencil of the painter and to the pen of the poet:—

Qual uomo è in su la rota per ventura,
Non si rallegri, perché sia innalzato;
Che quando più si mostra chiara, e pura,
Allor si gira, ed hallo disubessato.

So sang the bard of Lucca some six centuries ago, and the same refrain may still be sung with equal truth through each of the several layers into which poor humanity divides itself, and which taken together go to the making of society in the true sense of the word. To the Ulster King of Arms, however, this truth has not yet been brought home. To him society means the upper crust alone, and he stands afraid, with much amazement, to find that this very upper crust itself is subject to the whims and freaks of fortune. In former volumes he has mourned over the hard fate of those who once were part of that happy upper crust and are now lost in the chaos beneath. In the present one he undertakes the more congenial task of trumpeting the praises of those who still have the good luck to be uppermost. Still this task, delightful as it may be, cannot be made to cover more than sixty-four pages out of the three hundred and sixty-four which he has set as his limit, and he is fain to make up the remaining three hundred with padding in the shape of other "Essays and Stories."

In this his first chapter, however, Sir Bernard Burke makes the most of his space; for, acting up to the Irish axiom that every man is not only as good as another, but a great deal better too, he does his best to prove, first, that our titled nobility are the oldest families in the world; next, that our landed gentry without titles are still older; and, lastly, that nothing can excel the wisdom and talents of peers who have long mouldy pedigrees, except the countless virtues of the fortunate mushrooms who have lately been exalted to a place beside them. Were this self-constituted advocate of the claims of our nobles to consideration on the score of long descent any other than Sir Bernard Burke, we should pity him for having undertaken so very weak a case; but to a Herald all things in the way of pedigree-patching are possible. Certain it is that, as long as men nourish the fond belief that there is any truth in Heralds' pedigrees, the supply of that article, meted out by the yard according to demand, will not be wanting. Should the day ever come when Darwin's hard theory is universally accepted, we doubt not that the Heralds will be as great adepts at fishing up for their clients some oyster or limpet forefather as they now are in fathering them upon some shadowy follower of Norman William, which is all that their art at present aspires to.

In no other country in the world, unless it be America, is there so much innate thunkeyism displayed in the worshipping of mere rank as in England. On what grounds our nobility can lay claim to this reverence it would be hard to say. It cannot be from length of descent; for though Sir Bernard Burke tells us that "the best blood in Europe and the most historic illustration belong to the noblesse of this Empire," it is an unanswerable fact that, whereas in our island the oldest family-tree has its root in the eleventh century, on the Continent the same plant may be, and sometimes is, full two centuries older. As for the "historic illustration," we are somewhat at a loss to know what the phrase may mean. If it has any meaning at all,

that meaning surely is that the forefathers of the men who now make the House of Lords have in former days cut a fine figure in the national history. This is no doubt a very fine theory for those who are content to do nothing themselves and to borrow a reputation from the deeds of those who have gone before them; but in this case it is utterly groundless. The present House of Lords cannot show a single male descendant of the barons who met on Runnymede or of those who shed their blood in the Hundred Years' War. The ever-recurring revival and adoption of titles and surnames lead to a great deal of confusion on this point. People forget that the present bearers of these titles can lay no claim to the honour of descent from the worthies of feudal England, unless indeed it may be on the spindle side. Sir Bernard Burke himself tells us in another of his books that "all the English dukedoms down to the beginning of Charles II. are gone, except Norfolk and Somerset and Cornwall," and that "Winchester and Worcester are the only marquessates older than George III." Since he made that frank confession he has repented, and in the present volume does his best to atone for having let the cat out of the bag so indiscreetly. The peroration to his first essay is a quotation from Archdeacon Narves:—

So long as the English nobility and gentry pass the greater part of their time in the quiet and purity of the country, surrounded by the monuments of their illustrious ancestors, surrounded by everything that can inspire generous pride, noble emulation, and amiable and magnanimous sentiment, so long they are safe, and in them the nation may repose its interests and its honour.

Surely neither the Archdeacon nor Sir Bernard Burke could be in earnest, the one when he wrote such twaddle, the other when he quoted it. The theory that any man can fit himself for governing the living by staring at the effigies of the dead reminds us of the German legend of the "Castle of Fools." This castle was held by a singular tenure, which compelled each new heir on coming into possession to write the record of his own follies and read those of the follies of all who had gone before him, which were all duly deposited and preserved in the family archives. But, far from acting as the wholesome check which was intended, it almost seemed as if this queer provision of the first founder had tainted with a strange madness the spirit of his descendants. Each succeeding one seemed only bent on outdoing the others in the madness of his freaks and follies. Something of the same results, we fancy, would inevitably be shown forth in any family that was content to vegetate in the family seat, contemplating the tombstones of its race. Foolish enough, in all conscience, family pride does make our countrymen, but we hope there is no class of Englishmen yet sunk to this last and most hopeless stage of imbecility. If the bearers of ancient names would but keep in mind that "a long series of ancestors shows the native with great advantage at the first, but if he any way degenerate from his line the least spot is visible on ermine"; and if, instead of hugging themselves in the conceit of their own grandeur, they would lay it aside and pass a year or two of their early manhood *auf der Wanderschaft*, it is not impossible that they might yet add some lustre to their ancient names, instead of expecting the reflected light of their forefathers to tint them with its afterglow. Belief in pedigrees is unfortunately one of the most lasting delusions of human nature. But

The Gods are just, and of our pleasant vices
Make instruments to scourge us.

The eyes therefore of the worshippers of rank and title are hollen so that they cannot see that the first founder of a great race, however low his birth may have been, is presumably the greatest of that race.

We must now turn to the "other Essays and Stories." The first of these starts with the question, Who was Pamela? This question, about which we cannot imagine any rational person having a moment's doubt, takes Sir Bernard Burke a score of pages to answer. Perhaps he may not think it beneath his notice to tell in his next edition how this same Pamela became Lady Edward Fitzgerald, with a cap of Liberty on her head instead of a bridal veil, a daring defiance of public opinion which greatly scandalized some of her compatriots then refugees in England. We do not see why any one in the present day should care to know who Pamela was; but doubtless her connexion with Ireland gives her an interest in the eyes of the Ulster King of Arms which the public at large cannot be expected to feel. Indeed, "Ulster" seems to share very largely the prejudice of his fellow-countrymen, that no good thing is to be looked for out of Ireland. He does not perhaps let this feeling carry him so far as the Irish girl who on her first visit to the Opium declared it to be far inferior to the play she had once seen in Galway, and who begged her mother to let the pedigree tracing the family descent from the kings of Bresslin lie on the drawing-room table. Still, the cry of "Justice for Ireland" rings through the pages of the book, and "Ulster" cannot forbear to remind the Saxons that the tale of their ancestors is a mere idle dream when compared with the endless chain of which every O and Mac on either side of the Channel can boast. He has clearly a hankering for the good old days when Malachy wore the collar of gold, and when the said Os and Macs reigned supreme. We suspect, however, that the better part of the population of Ireland, instead of re-echoing a wish for the return of the palmy days, would be more inclined to join in the pious ejaculations inscribed over one of the ports of Galway—"From the fury of the O'Flahertys, good Lord deliver us." We should hardly expect to find so ardent a champion of the native Irish chronicling the glories and the follies of the Viceregal Court, but

* *The Rise of Great Families; other Essays and Stories.* By Sir Bernard Burke, C.B., LL.D., Ulster King of Arms. London: Longmans & Co. 1873.

we find that one of the "other Essays" is set apart for this special service. Next on the list comes the "Perplexities of Precedence," and we turn to it with a gleam of hope that here at least "Ulster" may have done good service to humanity by dispersing the misty ideas as to the exact dignities and titles due to younger sons and their offspring which obscure the minds of the vulgar. Our hopes are, however, disappointed. Sir Bernard Burke would have the etiquette of precedence made even more perplexing than it is. He joins the cry for the rights of women, and laments that the wives of all officials do not share the rank and place of their husbands in the Church or in the State. In fact, he tells us—

The truth is, the times have outstripped the old Precedence Code. That which was applicable to the days of the Tudors and the Stuarts, is somewhat out of date in the reign of Queen Victoria. The remedy is at hand. The three Kings of Arms, *Garter, Lyon, and Ulster*, should be required to examine the Statutes, Ordinances, and Regulations of Precedence in this country, to consider the best means of rendering the law suitable to the exigencies of the present age, and to draw up conjointly such a report as might embody all points of interest, and place the whole bearings of the subject clearly before the Crown. A Royal Warrant, or, if need be, an Act of Parliament, might then be obtained, to settle authoritatively a very "vexata questio," and to remove all perplexities, inconsistencies, and anomalies from the Law of Precedence.

Surely the remedy here proposed would be worse than the evil for which it is prescribed; for in the very same essay "Ulster" dwells at great length on the fury of a feud which raged between himself and his brother Lyon on the question of the right of precedence between Edinburgh and Glasgow. If the hawks did thus, in spite of the proverb, peck out each other's eyes about so small a thing, how could they be expected to see clearly into the sifting of so weighty a matter as the Laws of Precedence?

However well "Ulster" may be posted up in the traditions of his own Scotia, he is very much in the dark as to the history of the Scots of Britain; for he talks of the Douglasses as originally settling in Moray, and would have us believe that "the important families of Campbell and Graham were always Caledonian, and therefore the Dukes of Argyll and Montrose are chiefs of clans which existed in the days of the Romans." Every one who has read any Scottish history at all must know that the Campbells are not Celtic at all; the founder of the family being one of the stray knights, who made his fortune by taking part with Bruce, and marrying one of his sisters. They have gradually absorbed or turned out half the old Celtic clans of the West, and, after the manner of conquerors, take to themselves the praise of those they have conquered.

Sir Bernard Burke tells us that "the early annals of Scotland are made up of family disputes." We can only wish that he had added to this statement a list of the said annals, with information as to the hiding-place in which they have hitherto been lurking. The greatest difficulty in the history of that troublesome country has hitherto been that it can show no early annals of any kind, a few barren lists of unknown kings only excepted. On looking further, however, we find that Sir Bernard Burke's notion of the meaning of the word "early" must differ somewhat from our own, as all that he has drawn from the said annals is the mythical tale of the clan battle on the North Inch, to be found at length in the fabulous historians. All that can be said with certainty on the subject of this curious fray is to be found in the quaint words of the Prior of Lochleven, who tells as shortly as possible how the wild Highland-men fought and fell, adding the very natural comment that it was a "selcouth thing," though what they killed each other for he seems not even to have tried to make out. As to the names of the respective combatants which modern ingenuity has twisted into Clan Quhele and Clan Chattan, no clan now existing has as yet succeeded in making good its claim to either.

There is but one amusing anecdote in the whole book. We give it as it stands:—

"Sir John Schaw, of Greenock, a Whig, lost a hawk, supposed to have been shot by Bruce of Clackmannan, a Jacobite. In Sir John's absence, Lady Greenock sent to Bruce a letter, with an offer of her intercession, on Mr. Bruce's signing a very strongly-worded apology. His reply was:—

'For the honoured hands of Dame Margaret Schaw, of Greenock:—

'MADAM,—I did not shoot the hawk. But sooner than have made such an apology as your Ladyship has had the consideration to dictate, I would have shot the hawk, Sir John Schaw, and your Ladyship.

'I am, Madam,

'Your Ladyship's devoted servant to command,

'CLACKMANNAN.'

We note with sorrow that even "Ulster" himself is clearly uncertain in the matter of titles, if he presents the wife of Sir John Schaw to us as Lady Greenock.

We cannot lay down the book without quoting the prophetic note with which one of the essays begins:—"A history of the feuds of great houses would fill volumes." No doubt then Sir Bernard Burke intends that the volumes shall be filled, and, having worn the Vicissitudes of Great Families threadbare, he now means to make capital out of their feuds. It does not seem to occur to him that great families may be quite as sensitive as small ones to the unpleasantness of having their family affairs and failings probed and laid bare to the public. For our own part, we should be much tempted to quote for the benefit of all such inquirers into the history of their neighbours the witty answer of the elder Dumas, who, being too closely pressed about his ancestors, got rid of his tormentor with the reply, "My grandfather, sir, was a baboon; thus you see that my pedigree began where yours ends."

BRYCE ON THE NEW GERMAN EMPIRE.*

BOOKS have, and occasionally deserve, their fates. That of Professor Bryce's *Holy Roman Empire*, which now lies before us in a fourth edition, has been to develop from a University Prize Essay of rare promise into an historical and political treatise of permanent value. A German translation has been published of the enlarged work—no slight tribute of recognition on the part of a literary world peculiarly jealous of what it regards as its own domain. And while English historical scholarship has just reason to be proud of the signal proof furnished by Mr. Bryce's book of its vitality, English political life would be benefited by the infusion into it of such elements of insight and grasp as it reveals on the part of its author. The systematic study of a comprehensive subject by the light of political observation as well as of historical learning trains the student, as it were unconsciously, into fitness for other than literary tasks. It is by such a process, which is not one of everyday experience, that the schools and public life should come into vital contact with one another. Neither the sole nor the main end of historical study is to produce political capacity; the ripper student alone is able to judge of the bent of his own genius; and the systematic study of history in itself involves so severe an apprenticeship that it only gradually reveals its secondary uses to those who devote their minds to it. We smile at the ardour of a new Professor of History when, with the candid ambition characteristic of an inaugural address, he proposes to train up at his feet a generation of political leaders; for we know that time can be trusted to apprise all concerned of the occasional inadequacy of the means to the end. But when we observe how a sustained effort finally produces something like mastery over a field of inquiry extending from the foundations of mediæval political life to some of the chief political questions of our own day, we are ready to admit that the fulfilment of promise of one kind may itself be promise of another.

It is by no means only the supplementary chapter on the New German Empire, forming the distinctive feature of the new edition of Mr. Bryce's book, which has suggested the above remarks, though it is to it that they more especially apply. The events of which this chapter treats, and on which it furnishes a brief but instructive comment, are chiefly of our own generation, and in part only of yesterday. Their occurrence has been accompanied, *more nostro*, by a free expression of opinion on the part of Englishmen; nor has a general kindly sympathy been wanting on our part towards the advance of Germany to political unity and greatness. This sympathy has, however, to a great extent sprung from the admiration evoked by mighty achievements, and it has frequently failed to appreciate and accompany the less immediately momentous epochs of German national progress. And it must be conceded that the spirit in which the responsible directors of English foreign policy have met the successive changes which our generation has witnessed in German political life has by no means been characterized by that intelligence which springs from knowledge. We need not carry the moral further back, though it would be easy enough to do so. For at the Congress of Vienna the influence of Great Britain was steadily employed to perpetuate the main political difficulties of Germany at home and abroad. Everything was then done which could be done to depress and break up the power of Prussia, and to leave Germany with a weak frontier in the West. But, to come to more recent times, how blind have British statesmen proved to the significance of the Schleswig-Holstein difficulty in all its stages, how childishly was it always waved aside as an unintelligible chaos of perplexities, and how wantonly was the necessity overlooked of helping to satisfy just demands, if only in order to avert the ultimate consequences of thwarting them! Mr. Bryce, who has treated this subject correctly and clearly (only omitting to emphasize, in its bearing upon the question of the succession in both duchies, the significance of the capitulation of 1460), has given English statesmen credit for an earnest intelligence at the eleventh hour which we fear it would be difficult to substantiate. He says in a note:—

The inaction of England was attributed on the Continent partly to the personal influence of the Sovereign, partly to the supposed prevalence of "peace at any price" doctrines. But it really was in the main due to the fact that English statesmen found, when they looked into the matter, that the Danes were substantially in the wrong, though no doubt the hesitation of France, without whose aid it would have been folly to stir, had something to do with the matter.

The impression that any English statesman of mark had arrived at the conclusion indicated was certainly not left upon the minds of those who attended the debate of the year 1864 in the House of Commons. Lord Palmerston, who closed it, was specially careful to confine the substance of his remarks to topics as far away as possible from the particular question. Future generations are likely to read this whole passage in our political life as one of unsolved doubts and difficulties, affected by a prejudice in favour of the weaker side. On the other hand, it is certain (for Lord Russell in his prompt candour has already published the fact to the world) that the Ministry were divided in their views, and that it was the unwillingness of France, rather than a prevalence of opinion in favour of Germany, which produced the decision for peace.

Again, how little alive was our foreign policy to the real

* *The Holy Roman Empire*. By James Bryce, D.C.L., Regius Professor of Civil Law in the University of Oxford. Fourth Edition. London: Macmillan & Co. 1873.

significance of the projects of reform which occupied the barren period—as it seemed—between the reaction of Olmutz and Dresden and the outbreak of war with Denmark! To smile upon the Austrian attempt at contriving a revised constitution of the Empire, to which Prussia would have nothing to say, was perhaps a venial error; but how little our statesmen realized what to every German friend of progress had become an article of faith, that in the Prussian hegemony alone lay a fair prospect of a real national unity. They had so accustomed themselves to consider slowness the note of German politics, that they were unaware how the German nation had taken to heart the lesson of the failures of 1848-9. Once more, how imperfectly had those watched the historical growth of German national feeling who believed that it would have been possible for Bismarck to conclude peace with France in 1870 on any terms but the surrender of her two German provinces. In none of these cases does it necessarily follow that British policy should have been in consonance with German national feeling; but the want of knowledge sufficient to produce an appreciation of this feeling has been a grievous defect of our policy in German questions, and is the real cause of the coldness which undoubtedly at the present moment makes itself perceptible on the part of the Germans towards ourselves.

It is therefore of the highest importance that those who watch political movements should be thoroughly able to account to themselves for the historical growth of currents of national feeling which are real motive forces in politics. Mr. Bryce has shown very clearly how the motive force which has more than any other contributed to the great changes now accomplished, or in course of accomplishment, in Germany is essentially an historical sentiment. It would, however, be an error to mistake the historical sentiment in question—namely, an irrepressible desire for the recovery of national unity, and of national greatness through unity—for a mere romantic attachment to conceptions long dead and buried. The Holy Roman Empire, whose origin and decay Mr. Bryce has so lucidly described, has long been regarded as a mere phantasm of the past, except here and there by some barbaresque dreamer of an antiquarian turn of mind. The New German Empire is the inheritor neither of the ideas nor of the forms of its Imperial predecessor. It is the ancient German Kingdom from which so much strength went out to the Empire, while in return it received from the latter no accession beyond that of a higher dignity and a more ambitious moral significance, and not the Holy Roman Empire itself, or any semblance of it, which was revived at Versailles. For ourselves, we should be disposed to insist even more emphatically than Mr. Bryce might perhaps approve on the fact that all but everything which was real in the old Empire was Germanic and royal, and that all but everything which was unreal was Imperial. But nothing could be clearer than the historical descent which Mr. Bryce traces out for the Emperor William and his successors. From the old Empire the new has taken nothing of importance but the title of its head—and even this with a significant modification. The cool good sense which prompted this abstinence was, however, in complete accordance with historical propriety. A Roman Emperor crowned at Frankfurt in the year 1870 would have been not only a pretentious anachronism, but a mischievous fiction. A German Emperor receiving his new dignity from the princes of Germany, when at their head in command of a national army, is an historical truth in everything but name. For if it had been necessary to satisfy historical purism, and possible to treat the susceptibilities of the princes with contempt, the title of William of Prussia would have been that which Henry the Fowler wore, the sufficient title of German King.

The Imperial name, then, is nothing more than the symbol of national unity, and this it is to which Germany has primarily and above all aspired, ever since the great War of Liberation in 1813 once more taught her people to know and respect itself. The desire for popular liberty, more especially under the forms of modern constitutional government, has generally, but not at all times, gone hand in hand with the struggle for unity. It has not always been secondary to the latter; indeed, there have been periods—before 1848 more particularly in the South, and since that time in Prussia itself—when it has seemed to be uppermost in the popular mind. But before 1848 the party of progress was hampered, not only by the traditional opposition of governments and classes, but also by the indifference with which a large proportion of the population had accustomed itself to regard questions as to form of government. The ultimate result of the revolutions of 1848-9, and the strange issue of the Prussian constitutional struggle of 1862, has been to weaken rather than to fortify the party of constitutional progress. The *Reichsverfassung* of 1849, an admirably logical and complete constitution for a democratic monarchy, has been left in its pigeon-hole by the authors of the Constitutions of the North-German Confederation and the new Empire. In Prussia, in particular, after the party of progress had not only been openly defied by Bismarck, but had been obliged to see his unconstitutional policy approve itself under the light of later events, that party has been virtually extinguished. After the immense achievements of the last few years, the so-called National-Liberal party, which may be said at the present moment to comprise the vast majority of Prussian politicians, shows few signs of an intention to resume the endeavours of the old party of progress. Ministers remain responsible, not to the Parliament, but to the King; the right of initiating laws continues denied to private members; the Budget can still only be rejected *en bloc*, in which case the Government may fall back on last year's estimate of expenditure. But

what is more, the Liberal majority has proved willing that the Government should conduct a campaign against Rome on its own responsibility, and is ready to accept its policy, in this respect also, on general grounds, without requiring it to substantiate its assertion of the existence of exceptional reasons justifying an exceptional course of action. The struggle with Rome has been in a sense carried on in the dark; and the prevailing current of public opinion has been willing that it should be so.

These and other phenomena of the same kind are acquiesced in by Germans of liberal minds, partly because they attach no transcendental importance to what we regard as principles of constitutional liberty, partly and chiefly because they are contented to wait and to achieve unity before all. Much remains to be done even in this direction; and so far from the work having been accomplished, problems which require the study of statesmen historically as well as politically trained must in all human probability be solved under the eyes of this or the next generation. In the first place, German Austria remains outside the Empire—an unnatural arrangement, as untrue to the spirit of German history as any violent disruption perpetrated by Napoleon I. Again, the terms on which Bavaria and Wurtemberg have been admitted into the Empire must prove to be of an essentially temporary character. In general, it is as yet an open question whether the Legislatures of the several States will continue to be maintained by the side of the Reichstag, or whether the latter will be remodelled into an all-sufficient Imperial Parliament. Minor changes in the direction of unity, such as the abolition of the useless and possibly dangerous right of the separate States to receive and send diplomatic representatives, are only a question of time.

Our object has been to show how emphatically a broad historical treatment, such as Mr. Bryce applies to the great changes of recent occurrence in Germany, is necessary in dealing with transactions so distinctly influenced by a nation's consciousness of its past. The material forces which contribute to bring about ultimate results will not be neglected by the observer who takes moral forces into account as well. Mr. Bryce, we are glad to note, shows a healthy contempt for that school of writers who provide great nations and great men with "missions" devised *ex post facto*. Far too much, he truly points out, has been said of Prussia's mission, as present to the eyes of her rulers throughout the course of her history. He might have illustrated this common-sense view even more fully than he has cared to do. How was it, e.g. that the Great Elector, who had the mission so distinctly in his mind's eye, divided his territories before his death, and broke up, as far as in him lay, the Power which was to identify itself with Germany? Mr. Bryce has not scrupled to say, and we believe with perfect truth:—

Neither in the words or acts of Prussia's great Frederick (nor indeed in those of his predecessors) is there a trace of what may be called Pan-Teutonic patriotism, of any enthusiasm for the greatness and happiness of Germany as a whole. His purpose is to build up a strong and well-administered Prussian kingdom; for his German neighbours he has no more regard than for Frenchmen or Swedes; for the German language and literature little but contempt. The policy of his three successors was distinctly Prussian rather than German; and the romantic Frederick William IV. disappointed the hopes of the nation almost as grievously in 1849 as Frederick William III. had done thirty-five years before. No European Court has been more consistently practical than that of Berlin; nor any apparently less conscious of a magnificent national vocation. Her rulers have eschewed sentimental considerations themselves, and have seldom tried to awaken them in the minds of the people, or to turn them to account where they existed. When their interests coincided with those of Germany at large, it was well; but they were not accustomed to proclaim themselves her champions, or the apostles of her national regeneration. Nevertheless it had for a long time been evident that, if a political regeneration was to be brought about by force, it was from Prussia alone of the existing principalities that anything could be hoped, since she alone united the character, the tradition, and the material power that were needed to lead the country.

It is not with unmixed feelings that we peruse in Mr. Bryce's admirably lucid summary the story of the disappointment of the hopes of German political reformers, and of their sudden fulfilment by means of blood and iron. The bitterness of heart in which a tried champion of progress such as Gervinus died, and in which some equally true of heart continue to live, is intelligible enough; and it is only the shallow-minded who will condemn such Irreconcilables as these. But it is not the less true that the nation as a whole has risen with ready promptitude to the last opportunity which presented itself for a realization of its hopes; and that this opportunity was the tenure of power in Prussia by Bismarck. Resolved to overthrow the predominance of Austria, he put a virtual end to the dualism of Germany; the splendid success of the French war crowned the effort; and whatever future may be in store for the Empire, its basis is not likely to be moved or changed. Mr. Bryce may have to add more pages to his book; but the additions will probably admit of being included in the framework of his supplementary chapter. The new German Empire is not the passing creation of an hour of victory; it is an historical growth deeply rooted in the national soil, and on that soil and self-determined its future will unfold itself.

EARLY VENETIAN MISSIONS TO PERSIA.*

TOWARDS the latter half of the fifteenth century the course of public events had tended to bring into especial nearness both

* *A Narrative of Italian Travels in Persia in the Fifteenth and Sixteenth Centuries.* Edited by Lord Stanley of Alderley and Charles Greville. London: for the Hakluyt Society. 1873.

the political and the commercial relations between the ruling power of Persia and the Republic of Venice. A common or intermediate danger threatened the Powers of the East and West. The Ottoman Power, which had crumbled into dust the rule of the Byzantine Cæsars, seemed to endanger at once the independence of Christendom and the rising Mussulman Empire on its eastern border. A new dynasty had lately been established upon the ancient throne of Persia. The nominal reign of the descendants of Timour had passed away. The strife between the rival Turkoman tribes of the Kara Koinlu and the Ak-Koinlu, the black and white sheep, the former of whom had kept the throne from the year 1420, had ended with the defeat and death of Jehan Shah in 1468 by Uzun Hassan, chief of the Ak-Koinlus, who now became master of Persia, the last prince of the house of Timour, Sultan Abousseyd, soon falling before his conquering arms. The dynasty founded by Uzun Hassan was the Bâvenderee. His family had been established at Diarbekr since the time of Timour, who had made them grants of land in Armenia and Mesopotamia. This able and energetic chief had already been in collision with the Turks, in the interest of Oalo Johannes, of the noble house of the Comneni, brother of David, the last of the Christian Emperors of Trebizond, whose daughter Despina he had married, whilst still Prince of Diarbekr, before he had gained the Persian throne.

Despairing of making head singly, or even with the united Powers of Europe, against the common foe, notwithstanding the relief of Belgrade, the great Republic with far-seeing policy turned its eyes towards the East, in hopes of enlisting the arms and the influence of the hitherto almost invincible chieftain against his hereditary enemy. An embassy to Uzun Hassan was resolved on—no easy task, as the gauntlet of the Turkish power had to be run. The post offered by the Senate having been refused by Francesco Michelo and Giacomo da Mezo, a fitting envoy was found in Caterino Zeno, a merchant prince of courage and ability, who is called nephew to Queen Despina, having married Violante, one of the four daughters of Nicolo Cresspo, Duke of the Archipelago, whose wife was Despina's sister. The son of Dragon Zeno, who had died at Damascus, having penetrated as far as Bussorah, Mecca, and Persia, Caterino had some acquaintance with the East. A few enterprising men, tempted by the high pay of the Senate, went with him, and he was commissioned to offer Uzun Hassan a hundred armed galleys, with other ships, great and small, to fall upon the Turks from the sea, if he would not fail to press them with all his force by land. Leaving Venice June 6, 1471, Zeno passing through Caramania reached Persia with difficulty, and was received with the utmost rejoicing and honour, being even admitted to a personal intimacy with the Queen, through whose influence it mainly was that the Persian monarch was induced to enter upon the war which ended so disastrously for him. Uzun Hassan with his own hand wrote to the King of Georgia orders to begin the war in that quarter. Meanwhile the Prince of Caramania, having, for the offence of giving a passage to Zeno, been dispossessed by Mahomet II., had taken refuge at the Persian Court, and urged on the war. No news arriving of the promised preparations of Venice, Uzun began to mistrust the Republic, and had thoughts of leading his fine army against some Tartar chiefs, his enemies. The Senate had however in the interim sent another ambassador, Giosafa Barbaro, with a present of six immense siege guns, arquebuses, and numerous field-pieces, with powder and other munitions of war, and over a hundred men skilled in artillery. At the same time a captain-general was sent with a great fleet to the coast of Caramania, which recaptured the castles of the dispossessed prince and restored them to his generals.

The earliest campaign by land is of doubtful import, Knolles claiming as a Persian victory the engagement with Mustafa, Mahomet's son, and Amurath, near Boorra, in the autumn of 1472. Not so the next great encounter in the spring of the following year; for although, according to Zeno's report, ten thousand Persians fell and fourteen thousand Turks, the defeat of Uzun Hassan at Taboada was complete. Greatly discouraged, he dismissed, says the same writer, the Polish and Hungarian ambassadors, that they might not witness his misery, and despatched Zeno himself with urgent letters to all the kings of Europe. Casimir IV. of Poland, engaged as he was at this time in the thick of his Hungarian campaign, was moved by the envoy's appeal to the extent of ratifying peace within a few days; the like success attending his mission to Matthias Corvinus, by whom Zeno was dubbed knight with many honours at Buda, April 20, 1474.

The Venetian Senate in the meantime, hearing that Barbaro had not yet reached Persia, despatched on the 13th of February Ambrosio Contarini, who found Barbaro newly arrived at Ispahan, and well received, but was not so favourably welcomed himself, the Shah finding the Venetian promises more profuse than their deeds. He was dismissed with general declarations of being willing to resume war at some future time; and on his refusing to accept that conclusion to his mission, was compelled to leave by force, together with the envoy of the Duke of Burgundy. Nothing, indeed, came of the lofty protestations of the European Powers beyond the barren exploits of the fleet on the Black Sea coast. There Barbaro had lingered two whole years, only proceeding on his errand to the Persian Court in the spring of 1473, and then taking nearly a year to get there. He was welcomed favourably by the Shah, who was still at the height of his grandeur, having just received tribute from certain Indian chiefs. The revolt of his favourite son Ungler

Mahomet, and his defection to the Turks, with his tragical end, broke the old hero's spirit. He died without any exploit of further consequence, January 5, 1478.

The reports of their respective missions by the Venetian envoys were accessible to Ramusio, and were worked up by him into his collection, with the exception of that of Caterino Zeno, which he states he could never get hold of, but was able indirectly to prepare his narrative from the official letters of Zeno. Though they would seem to have been made use of in Ramusio's pages by Knolles, Maleolu, and other writers upon the history of Turkey and Persia, these reports have not hitherto been available in an independent form or in English. The Council of the Hakhyt Society have done well in bringing them out in a connected series as one of their volumes for the present year. The narratives of Giosafa or Jospha Barbaro, and Ambrosio Contarini, prepared for the press by Lord Stanley of Alderley, are supplemented by that of Caterino Zeno and three others, under the hands of Mr. Charles Grey, which amplify and carry on the history of Persia to a half-century or so later. One of these is the *Short Narrative of the Life and Acts of the King Uzun Hassan*, by Giovan Maria Angiolello; the second is *The Travels of a Merchant in Persia*, whose name there are no means of ascertaining; and the third is the *Narrative of the Most Noble Vincentio d'Alessandri*, ambassador from Venice to the Court of Tamasp, then in the last year of his long reign of fifty-one years. The whole six narratives make up something like a connected chapter of history, giving many particulars of Persian politics, the private life of the Shahs, and the relations between them and the leading Powers of the West. Precedence in order has been given to Jospha Barbaro, who has introduced his earlier journey into the Crimea, Circassia, and Georgia in the year 1436, giving many curious particulars of his experience of Tartar life. He burrows into the great tumult of Gulbedin, in the vain hope of treasure. He is shown by the King, among other wonderful jewels, a ruby like a chestnut, an ounce and a half in weight, not bored through, but set in a circle of gold; also a cameo the breadth of a groat, with a woman's head wearing a garland. "Is not this Mary?" asked the King. Barbaro thought not, but one of the ancient goddesses, worshipped by the idolaters before the coming of Christ. The mixing hops with wine made of honey, which became very stupefying, struck him as singular, as did the perpetual moving of the Tartar hordes in caravans, which reminded him of the "Egyptians"—one of the earliest occasions of the gipsies being mentioned. He is minute in his description of the system of irrigation employed in Persia, the water being conveyed under ground three or four days' journey from the river whence the supply is drawn. The scarcity of trees was as marked then as now in the territory of the Shah, the rainfall being excessively scanty, and the only fruit-trees to be seen depending upon the artificial water supply. The comparative lack of timber, however, was the cause of careful and admirable carpentry. The city of Ispahan—Spahan or Span, as it is called in the Venetian reports—is described as being four miles in circuit, or ten including the suburbs, with multitudes of goodly houses. Barbaro's travels extended as far and wide as Yezd (or Jex) and Shiraz (Syras); his further account of the country and its people being compiled from native reports, added to his study of geographical writers, of whom he gives a list, from Pliny and Solinus to Polo, Nicolo Conte, and Mandeville, with others as recent as Pietro Quirini, Aluise da Mosta, and Ambrogio Contarini. The editor has, with excellent judgment, instead of a more recent version, given us Barbaro's story in the quaint old English of the learned Welshman, William Thomas, who had been Clerk of the Council to Edward VI., and became known by more than one work upon Italian history and literature; and who left, among other MSS., *Le Pèleryne*, a defence of Henry VIII. against Aretino. He was hanged for treason May 18, 1553. Thomas's spelling of the names of places and persons is sufficiently puzzling to make the reader grateful for the foot-notes which explain that Citorehan means Astrakhan, or Hajy Terkhan; Cotathia, Koutais; Strana, Astrabad; the "Assumbei" is Hassan Beg, chief of the Ak-Koinlu; and "Ginssa" Jehan Shah. There are amusing archaisms in plenty, such as "doonye" (dunnie) for stupidly drunk. "Petriches" with "ryse podaise" at Tartar feasts are served to every man; which to them "are not ceynteth"—i.e., are not much valued. At burial-places young and old men and women "sitt in plumpes," in crowds or clumps. "As far as" is expressed by "as ferreforthes." On the Bendameer, besides a figure said to be Solomon, is a statue of a "hoystersouse" or robust man "whom they say is Sampson." It is not every reader who from "showing affru xii" an horse mary," would gather that shoeing horses cost a shilling a set, or would know that "gries" were "stepe," or that "well cowched," the equivalent of "erto" in the original, meant steep.

Angiolello and the unnamed Venetian merchant tell chiefly of the glories of Ismail Sofi, son of Sheikh Hyder, Uzun's son-in-law, by whom the fast declining power of the Ak-Koinlus was overthrown. In the short preface of Mr. Charles Grey, to whom the present translation is due, an outline is given of the events which preceded and marked his reign. Ismail, whose family traced their descent from Ali, the son-in-law of the Prophet, is known in Persian history as the head of the Kuzzilbashees (from the red cap or fez introduced by them), as well as the founder of the Shee sect, which has ever since distinguished the Soonee or Persian branch of the Moslem from the Osmanli. The most marked events of his reign

were the great victory of Merv Shah Jehan over the Uzbogs under Sheibani Khan in 1514, and his defeat by Selim I. on the plains of Chalderan, near Khoi, which left Tauris at the mercy of the Turks. From Persian history Angiolello diverges into a full and animated account of Selim's expedition against Egypt, resulting in its conquest by Turkey and the deaths of the two last sultans, Khafur-el-Ghoury and Toman Bey. It is strange that neither of these writers makes any reference to the successive sieges of Lepanto, or to the peace concluded with Venice in 1503, whereby the whole mainland of Greece was lost. There is a great gap between them and Vincentio d'Alessandri, who represented Venice at the Court of Tamasp, Ismail's son. This writer describes briefly the condition of the country and Court of Persia, and draws out its boundaries, which had been defined towards the West by the Tigris under the treaty with Turkey in 1555. The kingdoms comprised in the Shah's dominions are laid down as "Sunan (Shirvan), the ancient kingdom of the Medes, Aris, near Greater Armenia, Carassan (Khorassan), Chiessen (Yezid), Cheri (Herat), Diargonet (Damaghan), and Gilari (Ghilan)," the last named being in insurrection. Of his fifty-two cities the principal are "Tauris (Tabriz), metropolis of the whole kingdom, Carbin (Cushin), Ourassan, Naesimen (Nakshivan), and Samachi (Schamachi)." Commerce, which had of late greatly declined, had been somewhat revived by the arrival, by way of Muscovy, in 1561, of Anthony Jenkinson, whom D'Alessandri oddly calls "Mr. Thomas of London," with a letter from Queen Elizabeth and a quantity of cloth. His death and the seizure of his goods left little encouragement to further enterprise towards that quarter of the East. Although inferior in interest to the travels of Varthema, and to many other narratives of adventure and discovery in the Society's series, these records of Italian travel and diplomacy in the East are striking and instructive enough to justify their selection by the Council, and to render them welcome to the subscribers and the public.

THE SPEAKER'S COMMENTARY.*

TWO more volumes of what is still, for convenience, called the *Speaker's Commentary*, have appeared since our last notice of the work. Of the former of these, which includes the books of Joshua, Judges, Ruth, Samuel, and the First Book of Kings, we propose now to say a few words. The progress of this Commentary is extraordinarily slow. Lord Ossington has not only ceased to be Speaker, but he has paid the last debt of nature. Yet the work to which he gave the impulse, and which borrowed from him its name, has only reached the Book of Esther. We cannot account for this. For the task is subdivided among many labourers; and, to say the truth, no great pains seem to have been bestowed by some of the coadjutors on the undertaking. One of the contributors, at least, to the volume now before us can have done little more than elaborate for the printer the rough notes which he took for his own use when he first read the sacred text in the original. Does the delay point to the difficulty which the most versatile and accomplished of editors must necessarily face if he has to reconcile discordant views, and to adapt them to the timidity or the imperfect knowledge of a superintending committee of cautious dignitaries? At any rate, the result in respect of matter as well as of time is far from satisfactory. The Commentary will be a disappointment, we are sure, to many of its best well-wishers. Then, again, the price of the work is almost prohibitive to the class of readers for whom it was intended. The volumes, it is true, are beautifully printed; and the type is large enough for aged eyes. But we question the advantage of giving the text of the Bible in full, in an edition which was meant for wide diffusion. The cost might have been reduced by at least two-thirds if the notes and commentary had been printed in a separate form. And this was all that was really wanted; for every one possesses the authorized text, and could refer to a separate commentary when necessary.

The first thing that strikes us in examining the volume now before us in a critical point of view is the very scanty revision or amendment of the translation of 1611 that has been attempted. We do not know that this is much to be regretted. But it seems scarcely to answer to the magniloquent promise of the title-page. In the second place, we find in this volume the same flagrant defect on which we commented in our former notice. We mean the studied absence of any recognition of the cardinal truth that the highest sense and meaning of the Old Testament is to be found in its anticipation of, and preparation for, the Christian dispensation. Nothing can be colder or more jejune than the mere critical discussion of the Hebrew text, with disquisitions on the geographical or ethnological questions arising out of it, while the spiritual value of these ancient documents is practically almost ignored. For an occasional "improvement" of a subject—to borrow a word from the terminology of the pulpit—or a patronizing apology for the lower tone of morality that prevailed before the Gospel, cannot be said to satisfy the demands of Christian exegesis. By far the worst offender, in this respect, of the three scholars who are associated in this volume is Lord Arthur Hervey,

the Bishop of Bath and Wells. Take as an example this most inappropriate little homily on the angelic appearance to Manoah, in Judges xiii.:

The just reasoning of Manoah's wife is exactly applicable to the representation of Christ, as affording the most solid ground of assured hope that the sacrifices of Christ are accepted as an atonement for the sins of the world. The coming of the Son of God to our earth, with all its accompaniment of teaching and miracle, is of itself a signal proof of God's "goodwill towards men"; and the "good tidings of great joy" concerning the "Saviour, which is Christ the Lord," may well soothe the alarm of the most troubled conscience.

Is not this feebleness itself? To give another example of our meaning. The same commentator, again, has not a single word to say about the typical character of Samson—one of the most profound and mysterious subjects in the ancient Scriptures—but is content with discussing in detail the minor incidents of his story. Here are specimens of these annotations:—"The transaction denotes loose notions of the sanctity of marriage among the Philistines"; and he superfluously observes further on, upon the last words of Samson, that they "do not breathe the spirit of the Gospel."

It must be very difficult, of course, for a superintending Editor to take care that his several contributors do not widely differ from one another. Mr. Cook has not always been successful. Thus Lord Arthur Hervey dilates on the extremely important point, as it seems to him, of the connexion of the Book of Ruth with that of Judges on the one hand, or Samuel on the other. Canon Rawlinson, on the contrary, with the strong good sense that characterizes all his share in this work, flatly contradicts his colleague. "There is no real continuity of narrative," he says, "between Judges and Ruth, or between Ruth and Samuel. A formal continuity by means of the *et* connective is all that can be said to exist." It seems to us that the several writers engaged in this Commentary ought to have come to some previous understanding on so important a point as the authenticity of the numbers given in the received Hebrew text. Yet the Bishop of Bath and Wells has nothing more to say about the "forty and two thousand" Ephraimites slain at the passages of Jordan because they could not pronounce *Shibboleth* than this:—"A large number! But it includes the slain in battle and those killed at the fords. Perhaps, too, it is the whole number of the Ephraimite army." In some additional notes, however (which are perhaps the Editor's), it is admitted that there are serious errors in the statements that fifty thousand men died at Beth-shean for looking into the Ark, and that the Philistines brought no less than thirty thousand chariots into battle against Saul. Canon Rawlinson, on the other hand, in his excellent Introduction to the Two Books of Kings, honestly admits, and very sufficiently accounts for, the great errors that are to be found in the numbers of the Hebrew text, and consequently is not obliged to believe implicitly in the forty thousand horses of Solomon's stables, and the seven hundred wives and three hundred concubines of the harem of the same monarch. On the mystical numbers of Scripture—a very difficult subject—the Commentary is silent. Mr. Rawlinson refers to them, though far too cursorily, in mentioning the seven thousand who had not bowed the knee unto Baal. It is, however, in connexion with what is called "the received chronology" that the question of the Hebrew numbers is of most importance. Upon this subject we find a very valuable and sound additional note on 1 Kings vi. 1, on the statement that the fourth year of Solomon was the 480th year from the Exodus. The conclusion arrived at is that this date is an interpolation into the text.

We notice another remarkable discrepancy in the present volume. The subject of what is called "grove-worship" is full of interest, and we turned to the Commentary for the latest information about it. There we found Lord Arthur Hervey declaring that the words "served Baalim and the groves," in Judges iii. 7, imply a wrong understanding of the word *asherah*. It ought to be, he says, served Baalim and an idol of Astarte. In other words, there is no grove-worship at all; and when Gideon is said to have cut down the grove at Ophrah, it means that he cut down a wooden image of Astarte. There are difficulties in this, as it seems to us. But then Canon Rawlinson, on 1 Kings xiv. 15, says, "The grove-worship, adopted from the Canaanitish nations, appears to have died away after the fierce onslaught which Gideon made upon it. It now revived and became one of the most popular of the idolatries both in Israel and Judah." And yet further on, describing Queen Maachah's "idol in a grove," Mr. Rawlinson bids us translate the words rather as "a horror for an asherah," i.e. a grotesque and hideous image of Astarte. And, still further on, Jezebel's four hundred "prophets of the groves" are said to be the priests of the *asherah* or grove which Ahab had made at Jezreel. We cannot quite reconcile these several comments.

Turning now to the particular writers of this volume of the Commentary, we find that the Book of Judges fell to the lot of Mr. Pepin. This gentleman seems to us to have done his work with signal ability. He is not only a sound scholar, but a man evidently of judgment and knowledge of affairs. This comes out strongly, for example, in his discriminating remarks on the political aspects of the invasion of Canaan by the Israelitish hosts and the destruction of the nations of the land. The same intelligence is evident in his observations on the choice of Shiloh as the first political centre of the new commonwealth, and, still more notably, in his comment, on Joshua xxi., on the completeness *ex parte Dei* of the

* *The Holy Bible according to the Authorized Version; with an Explanatory and Critical Commentary, and a Revision of the Translation, by Bishops and other Clergy of the Anglican Church. Edited by F. C. Cook, M.A., Canon of Exeter. Vol. II. London: John Murray. 1873.*

accomplishment of the Divine promises to Israel in their acquisition of the Holy Land. Then, again, he is strong in physical and political geography, and his notes on these subjects throughout the Book of Joshua seem to us trustworthy and very instructive. Nor is he afraid to discuss, with moderation and sound judgment, the miracles that abound in this book, not excluding the one of Ajalon. And he can afford to laugh at the discordant neological guesses as to the authorship of Joshua by Ewald, Knobel, and Herwerden.

Compared with Mr. Espin, the Bishop of Bath and Wells (who is responsible for Judges, Ruth, and Samuel in this volume) seems to us a far less trustworthy commentator. His notes are for the most part dull and tasteless, and singularly unappreciative. For instance, he scarcely seems alive to the exquisite poetry of the Song of Deborah or of the Book of Ruth; and in general his view never goes beyond the bare letter of the text. Where he does see the beauty of the imagery, as in David's lament over Saul, he seems wholly to miss the political sagacity so conspicuous in that threnody. Unlike Mr. Espin, he generally ignores miracles, though in one place he seems to go out of his way to suggest a thunderstorm as a possible explanation of the water stricken from the rock of Horeb. Many of the Bishop's notes, as we said before, seem to be little more than the crude jottings down of his first reading. They are often provokingly useless. Imagine commenting on the impassioned outburst of the Song of Deborah—"Hear, O ye kings; give ear, O ye princes"—in these tame words:—"A moral lesson is addressed to the kings and princes of the earth"! Again, on the words "The Lord shall sell Sisera into the hands of a woman" our commentator gravely writes, "viz., Jael." On the words "Orpah kissed her mother-in-law," we are told "The kiss at meeting and parting is the customary friendly and respectful salutation in the East." Again, when Boaz says to Ruth "My daughter," we are instructed that it is "A kind phrase, indicating at the same time Boaz's mature age." When Eli addresses the fugitive from the rout of Eben-Ezer as "My son," the note tells us that it is "the paternal address of an old man and one in authority to a young one," and adds a half-score of references to the same expression in other parts of the Old Testament. It is, if possible, still more comical to have Eglon's words "Keep silence" explained thus—"or, in one word, hush! an intimation to his attendant that he wished to be left alone." We could multiply these examples by the score. What can be more profitless than referring to all the examples of the phrase "provoked the Lord to anger"? or, again, than telling his readers that "until thou come to" is a phrase "very frequent in geographical descriptions and might be paraphrased by 'the road'." We noticed in one place at least (on Judges xiii. 16) one of those tedious diluted paraphrases which used to do duty, in earlier commentaries than this, for true explanations, but which are creditably rare in this series. When information is really wanted, it may be looked for, too often, in vain. Thus Gideon's "ephod" is not satisfactorily explained. Nor are we told what precisely to understand about the Personal Presence in 1 Samuel iii. 10. Nor is the "stump" of Dagon, when the idol was overthrown before the Ark, described as the fishy tail of that sea-god. Nor, in treating of divination and witchcraft, does the Bishop seem to know anything of Dr. Samuel Maitland's most learned discussion of these subjects. Again, the "prophesying" of Saul on more than one occasion is not explained, although unlearned persons are notoriously puzzled by this expression in the New Testament as well as the Old, from the erroneous idea that the word necessarily implies a prediction of future events. We think it doubtful whether the writer of the note on 1 Samuel xviii. 10 has any clear notion what the word there means. Canon Rawlinson, however, on 1 Kings xviii. 29, well explains the phrase as expressing "the utterance of words by persons in a state of religious ecstasy." After these animadversions it is a more pleasant task to point to instances of satisfactory interpretation. Such seem to us to be the Bishop's explanation of the "blind and the lame hated of David's soul" at the taking of Jebus; his description of Naioth in Ramah as the collegiate house of prophets established in that place by Samuel; his comment on the statement in 1 Sam. ii. 15 that Hophni and Phinehas "hearkened not" to the voice of Eli, "because the Lord would slay them"; and his observations on libations, suggested by the account of Gideon's sacrifice.

We defer to a future occasion some further remarks on Mr. Rawlinson's commentary on the First Book of Kings, which concludes the volume before us. They will come more conveniently in a notice of the third volume, which contains the Second Book of Kings, together with the Chronicles, Ezra, Nehemiah, and Esther, all annotated by the same competent and experienced scholar.

CROOKED PLACES.*

"I THINK we mostly read too fast," says one of Mr. Garrett's chief characters at the very close of his third volume. As the old lady who made this utterance was given to "crooning" hymns, and did not read novels, she was not, we maintain, a very

good judge. We, for our part, should have thought that people are given rather to writing too fast than to reading too fast what is written. It is but a very few months since we noticed Mr. Garrett's *Seen and Heard*, and here he is again with another novel in three volumes. When one single author compels his unfortunate critics to read six of his volumes in less than six months, he is as unreasonable surely in complaining of rapidity of reading as the governor of a gaol would be in complaining of the rapidity with which a convict got through his daily course on the treadmill or his daily picking of oakum. We read Mr. Garrett quickly for the same reason as we travel through a very flat country quickly, or would, if only it could be managed, listen to a dull sermon quickly. We have a high respect for Mr. Garrett's qualities as a moralist and a man. No one could be worse for reading Mr. Garrett's novels—unless perchance, like an impatient traveller who had got into a Parliamentary train, he took to swearing. Many people indeed might be made much better if only they could be kept awake long enough to see how the good are rewarded and the bad are converted. They form an admirable series of reading for a serious family of evangelical and teetotal tendencies, and must tend to keep the spirits at that calm and even flow which is so often noticed in those who are habitual readers of tracts and drinkers of ginger-beer. If the celebrated Bank forgers had only sat at Mr. Garrett's feet, they would doubtless find that they still had a life of hard labour before them; but they would have its monotony relieved by tea-meetings, a pudding for supper, an occasional visit to the Zoological Gardens or to Epping Forest, and a cheerful Sabbath in the best room. If only they had come across Mr. Garrett's books, or Mr. Garrett's heroines, they might every Sunday be sitting, not in prison, but, like a converted dustman in the story before us, "with oiled hair on a back seat in Zion Chapel." Whether, by the way, the dustman oiled his hair symbolically, or out of regard to the requirements of society, we are not told. A certain unctuous appearance is doubtless given to a congregation by the fashion that generally exists of this Sunday oiling. Nevertheless, however pious an appearance the dustman presented at Zion Chapel, he must have found his oiled head grow unusually heavy as he followed his trade on the Monday. We are quite ready to admit that there are a great many worse stories written than Mr. Garrett's. They are not duller than the so-called sensational novels, and, unlike these novels, they are eminently fit for family reading. Though they are religious stories, as the name goes, they are not bigoted; and though Mr. Garrett clearly favours the Dissenting chapel, he allows that salvation may be found also in the Established Church. When his exemplary characters indeed have a backsliding, and no longer "find comfort in sermons," their case then, we notice, is sure to be beyond a vicar or a rector, and a Zion Chapel and an aged minister, like a *deus ex machina*, have to be brought in.

While we so readily allow that there is merit in Mr. Garrett, we regret that he has taken so much to heart the remarks which reviewers have made on his former works. As for ourselves, though we have laughed over his tediousness and the fine language in which he bestows it all on his readers, we have at the same time had the satisfaction of feeling that, while we amused ourselves, we did not hurt him. The carnal-minded readers of the *Saturday Review* care but little, we fear, for the Sunday oiled head of a dustman, and would as soon think of sitting with oiled hair in a back seat in Zion Chapel as of reading Mr. Garrett's novels. But there is always a chance, too, he should remember, that some miserable sinner who, like one of the greatest sinners of the story, keeps "always a clay-pipe on the mantel-shelves and likes to drink his ale, at all hours, out of a pewter-pot," may remain to pray where he has come to scold, and, moved by some quotation we have given from one of Mr. Garrett's novels, may throw away his *Saturday Review* and hurry off with oiled hair to sit beside the dustman. Of him Mr. Garrett would be able to boast that, owing to his agency, he has, like another converted character in the story before us, "left off smoking in the best room, and put his pipe away altogether on Sundays." Mr. Garrett then should satisfy himself with the comfortable feeling that out of evil good may come, and that a *Review* that is published indeed on Saturday, but too often read on Sunday, may be made the means of saving a soul that "treads the slimy paths of sin." We are not far wrong, we think, in identifying the author with his hero George, who publishes a book called *Talks and Meditations*, and whose books, according to one of the characters, seem "written by some of the wise professors and poets whose works I used to read in my young days." Books so wise can surely stand a little laughter, and there is no need for the author to follow the advice which an enthusiastic admirer thus gives him:—

"If I was George, next time I wrote a book, I'd put on the title-page, that 'no one need trouble himself to review it, that didn't believe in God, read the Bible, live with one wife, and pay his debts.' Let wicked infidels get their living by reviewing wicked infidel books—and a precious poor living they'd get."

Mr. Garrett complains that reviewers "condemn the author's ignorance for a printer's typographical blunder," and, curiously enough, in this very paragraph we read of "the reviewer who professed" (*sic*). But for the chief errors which we find in Mr. Garrett's books he, and he alone, is answerable. We are glad to notice that in the book before us he is far freer from a use of fine words of which he does not understand the meaning than he has ever been before. If he makes equal progress in his next work or two

* *Crooked Places: a Family Chronicle*. By the Author of "Premiums Paid to Experience," "The Crumb and the Cake," "The Occupation of a Retired Life," "Seen and Heard," &c., &c. 3 vols. London: Strahan & Co. 1873.

he will shortly be able to use with a considerable degree of certainty all words of Greek derivation, even if they are five syllables long. We should be curious to know, however, what he means by "bravado parallels," or by "a halo of trustful confidence that rose like an incense," or by "spiritual salt which became a savourless formula," or by "a metaphysical gymnasium." We should be glad to know what is the meaning of the following question, which he coolly enough places in the mouth of his reader:—

Askest thou, what is the use of the secretaries and euphemisms behind which grow up only fair flowers of endurance and sacrifice?

Mr. Garrett should learn, moreover, greater caution in the use of the metaphor and the simile, of both of which he is very fond. In one passage he tells us that

some of the fairest points in a man's character might be but treacherous peat mooses, unfit to bear the tread of daily life and companionship.

In another passage he writes:—

Folks make excuses for the man who slips into the slough of his worst nature, but cannot endure him who struggles out of it so hardly, that he cannot sit gracefully on its edge!

At all events, if he will write such passages as these, he should give us some accompanying engraving, so as to bring the meaning more clearly before us. We should like to see the picture of a man who could sit gracefully on the edge of any slough, let alone a slough of his own worst nature. Mr. Garrett makes some curious errors in chronology, which can scarcely be set down to the printer. His hero George, when in his boyhood he takes to writing poems, has "set his boyish heart on buying a bound and ruled book wherein to copy his poetical efforts. These things," Mr. Garrett goes on to remark, "were not so cheap sixty years ago as they are now." Within a few pages of this paragraph he introduces the police cell and the temperance pledge; while a very few years later a local newspaper, the *Hackney Mercury*, has a whole chapter to itself. Much about the same date one of his characters says, "It is something like Robert Owen's theories. And yet they did (sic) not work well." Again, at a period which from the course of the story cannot be less than thirty years ago, we have the electric telegraph playing its part.

Mr. Garrett's plots are always very simple. He has studied Hogarth, and he gets together a sufficient number of good and bad apprentices. He is more moderate, however, in his distribution of rewards and punishments. He rewards the virtuous with "an old red house, with old brown rooms, and an old green garden," at Hackney or at Tottenham; while the wicked he either converts and allows to share in all the happiness of a house that has a best room, or else leaves them alive at the close of the third volume in the hope that they may yet be converted. He is strong on the inward and spiritual grace. He tells us how one of his characters, who was already to our mind a most virtuous and religious lady, "found her spiritual speech" when she lost her child, just as "science (sic) tells us that the dumb have sometimes articulated under the pressure of anxiety and alarm about their darlings." But he is scarcely less strong on the outward and visible sign. Sunday with him is a day when the best room is used, when converted dustmen oil their hair, when pipes are laid aside and the coat of the Sunday pipe is put into the Bible Society's box, and when gloves must be worn. "It takes a great struggle," he says, "for a delicately-bred lady to accept that it is her duty to God and man to go out bareheaded, and store her one pair of gloves for Sunday wear." He likes to get his people from "a genteel chapel-of-ease"—a chapel-of-ease means, he doubtless thinks, a chapel where people worship at their ease—on to the back and cushionless seats where they will find "a more faithful and devout ministry." And then he leads them, through privations no doubt, and hardships, to all the bliss that a well-ordered suburban residence can afford. His sinners for a time live in "a splendid saloon," and, as they to all outward appearance prosper, make it "still more resplendent with satin and gilding"; but then they have "never reflected that even a marble palace, with all its beauty, is not a desirable residence, unless its foundations are sound and right." How very far from sound and right are the foundations of the marble palace in which the chief among his sinners, Fergus Laurie, lives, may be inferred from the following passage:—

But Fergus thought this calmness augured patience, and superbly took no notice, till one day he found that legal proceedings were commenced, and next, that that sort of domestic harlequinade was necessary, which so often begins among ornula and choice wines, to be set up again and again till at last there is nothing behind it but a pawn-ticket and a corpse!

Such a knave as this Fergus the moralists of the last century would never have parted with till they had seen him fairly hanged. Mr. Garrett can scarcely make up his mind to leave him even unconverted. He evidently longs to call back this stray sheep into his suburban fold, and to let him enjoy to the full all the pigsty and all the peace which Zion Chapel and Hackney can give. But his story, he feels, must have some variety, and of converted sinners his readers may possibly have had enough. As it is, he gives us at least two who get not only converted, but also married, besides the pious dustman who, being already married, merely oils his hair. Fergus, therefore, cannot be allowed to repent, and so withstands his best friend, who beseeches him not to "defile the immortal with the mire of a stormy hour." Out of this Fergus Mr. Garrett gets some of his most impressive writing. In no passage is he more impressive than in the following, where he contrives to improve Shakespeare and the young reader at the same time:—

Oh, Fergus,—poor Fergus, there is another chance in life for you yet! Young reader, fearful lest there be no bright possibilities in your own path, take this fact from one who has seen much. For one life that is dwarfed for want of "a chance," a thousand are ruined by the waste of scores of chances. Shakespeare himself tells us of the tide in the affairs of men, and of the disastrous consequences of losing it. Is it presumption for me to add that the tide seldom fails to return again and again, only that the loss of it is likely to be repeated? If pride, or indolence, or anger, kept us prisoner ashore when the last flood of fortune came in, we may lament its ebb how we like, but unless we set about building our harbour, we shall be no better off next tide.

We would not part with Mr. Garrett in an unfriendly spirit. We find him dull, very dull, but then we are of that unconverted order of men who "find no comfort in sermons," and who never oil their hair on Sundays. The day may arrive when, in a peaceful retreat in Hackney or in Tottenham, we shall, with Mr. Garrett's converted sinners, have seen the error of our ways, and have laid aside our pewter-pot, and put our pipe out not only on Sundays, but also on week-days. When that time comes, we shall no doubt as eagerly read his writings as one of his heroes in his last story read Newton's *Cardiphonia*. Meanwhile we beg to assure all our readers that they can with a safe conscience recommend their friends and their children to read *Crooked Places*.

We have been requested to state that the accident to a goods train between Burton and Crewe, mentioned in the SATURDAY REVIEW of last week, occurred, not on the London and North-Western, but on the North Staffordshire, Railway. The London and North-Western Company have, "we are informed, no wedge-motion engines.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

The SATURDAY REVIEW is duly registered for transmission abroad.

Nearly all the back Numbers of the SATURDAY REVIEW may be obtained through any Bookseller, or of the Publisher, at the Office, 38 Southampton Street, Strand, W.C., to whom all Communications relating to Advertisements should likewise be addressed.

The publication of the SATURDAY REVIEW takes place on Saturday Mornings, in time for the early trains, and copies may be obtained in the Country, through any Newsagent, on the day of publication.

Now ready, VOLUME XXXV., bound in cloth, price 10s. Cloth Cases for Binding all the Volumes, price 2s. each. Also, Reading Cases, price 2s. 6d. each. May be had at the Office, or through any Bookseller.

MR. BRIGHT IN OFFICE.

MR. BRIGHT has attended at Balmoral and received the seals of office. He is now once more a Minister of the Crown, and one of the most important parts of the scheme of Ministerial reconstruction has been carried out. His resumption of office is by no means palatable to the more extreme section of Liberals, and there are journals in which sneers at "JOHN BRIGHT in plush" are thought witty, and even conclusive. But Mr. BRIGHT has sense enough to know that an English politician, when duly called on to serve the Crown, owes it to himself and the country not to refuse, and that the position of a reformer who is always proposing vague schemes, which he has neither the ability nor the wish to embody in practical measures, becomes after a time a very poor one. Nor is it at all a characteristic of Mr. BRIGHT's mind to dis sever himself from the current politics of the day. He has always wanted changes which it was possible to conceive Parliament accepting, and the intemperance to which he used to give way was probably much more an intemperance of language than of design. His acceptance of office now that his health is fortunately restored is in every way natural and proper, and, as he failed altogether as an administrator when previously in office, it is highly convenient that he should return as Chancellor of the Duchy of Lancaster, and be saved, by having no duties to perform, from the risk of performing his duties ill. But it is impossible to suppose that he comes back to take his place in the Cabinet merely because he happens to be well enough to take it. His colleagues, and especially his chief, must have given him to understand that he could be of use to them, and he must have responded to the appeal because he was willing to be of use to them in an emergency, if this was their view. And, if all exaggeration is carefully avoided, it may be taken as probable that the accession of Mr. BRIGHT will do something to strengthen the Ministry. He will not conciliate the support of ardent and advanced democrats, for they look on him as a man whose day is past, and who is the ally of the tyrannous owners of capital. He will be able to do nothing, or scarcely anything, to gratify the special fancies of those who think him their champion. He will not stop the Ashantee war, or interfere with Mr. GLADSTONE's Budget, or recast the Education Act. But then those who wish that he should do one or more of these things will be gratified by reflecting that they have a friend of their way of thinking in a high position. They will be soothed by the hope that the most that can be done for them is being done, and they will find comfort in the belief that a Cabinet which contains one leading member of the right sort cannot go altogether wrong. The ordinary provincial politician also is largely guided by names, and local organizers of the Liberal party who have heard and who dread the taunt that the Government has, on one or two recent occasions, basely sought the aid of the Conservatives, will feel inspired by the power of replying that it is nonsense to say such things now that Mr. BRIGHT is there to guarantee that Liberals will always do as they ought to do.

By accepting office Mr. BRIGHT vacates his seat, and one of his first duties will be to address his Birmingham constituents. It is no difficult for him to say much at the present time without saying too much, that he may think it discreet, when framing his address, to say as little as possible. But it may happen, on the other hand, that he and his colleagues will consider this a good opportunity of revealing something of the future policy of the Government. The recapitulation of the services rendered by Mr. GLADSTONE's

Ministry, and of the great measures it has passed, may become so stale and wearisome that, if Mr. BRIGHT is to do the Government any good by his address, he must begin with reference to the future rather than the past. But it is scarcely credible that in this direction Mr. BRIGHT should do very much to help his bewildered colleagues. It is a very well for a minor unofficial member like Mr. LEANES to say that Liberals must always advance, and that they are now to go for a free Church, free land, and free labour. Language of this sort is out of the scope of Mr. BRIGHT. In the first place, he will know that phrases of this sort are utterly unmeaning, and that he must be taken to mean something before his utterances can be of any value. He will write and speak, too, as a Minister of the Crown, and he will have to consider what can practically be proposed and carried. Then, again, one of the causes of that unpopularity of the Ministry which he is to redeem, if he can, is the general perception that they are inclined to do too much, and want to urge the country forward faster than it likes to go. Far from helping the Ministry, Mr. BRIGHT would give it its deathblow if he increased the vague sense of "Conservative" which now possesses so many constituencies. In avoiding generals, by confining himself to particulars, he will for the most part have to speak of measures such as the readjustment of local taxation, and the simplification of transfers of land, which lie out of his range, and will be in the hands of colleagues over whom he will have no practical control. It is, however, never safe to predict that a man with so much vigour of thought and so great a command of language as Mr. BRIGHT will be tame and insignificant when he is called on to do his best. If the Cabinet has in contemplation a measure which is not unpractical, and yet is of a kind to waken Mr. BRIGHT's enthusiasm, he may prepare the way for it more effectually than any one else could. The extension of the county franchise may serve as an example. No one doubts Mr. GLADSTONE's sincerity, but he is apt to take up schemes of change on a sudden, and as if under the influence of a strange inspiration or caprice. If Mr. CARDWELL or Mr. LOWE proposed to give votes to farm-labourers, every one would suspect that they were making a mere party move. But this extension of the suffrage is quite within the order of Mr. BRIGHT's ideas. He would believe in it, bestir himself to promote it, and advocate it from his heart. This might possibly be a real help to the Government. If they want a Liberal cry for the next election, and cannot think of any other than the extension of the county suffrage, it would be immensely convenient to have the cry started by a Minister who firmly believed that it was the cry of justice and wisdom.

Mr. BRIGHT will be just in time to take part in the series of Cabinet Councils which are being held at present, and to aid in settling the Ministerial programme. It must be owned that a Ministry in the position now occupied by that of Mr. GLADSTONE is in a very uncomfortable position. It is sure to be abused whatever course it may take. If it does as little as possible, and tries to be safe and conciliatory, it is pronounced to be used up, effete, and good for nothing; a sham stalking-horse sort of Ministry, which had better get to its limbo as soon as it can. If it tries to show itself active, zealous, and enterprising, it is set down as the cause of needless trouble, as wearying every one with its constant fussing, and driving the country wild with over-legislation. There is only one way for the Ministry to escape from this stream of criticism or misconstruction, and that is to go out of office. But the difficulty is how a Ministry with a majority still amounting to something like seventy is to get out of office. The Conservatives had the oppor-

tunity last spring of taking office and dissolving, and they wisely judged that the time for their triumph had not come. Since then they have gained a few seats, but a Minister with a large majority, and who has given his opponents an opportunity of appealing to the country, is not bound to dismiss a House of Commons that supports him because a few seats are lost. It is for Mr. GLADSTONE to decide whether he can carry on business for another Session with a fair prospect of doing good and not losing self-respect, and with the tacit concurrence of the country. If he decides on making the experiment, Mr. BRIGHT will be of some use to him. The gain will not be very great, for Mr. BRIGHT has no turn for upholding in debate Ministerial measures simply because they are Ministerial. The subject on which he speaks must be congenial and familiar to him, if his great oratorical power is to produce any effect. But it can scarcely happen that a Session should go by without opportunities arising where Mr. BRIGHT will be able to bring his eloquence, if his physical strength permits, to the aid of his friends. There are several reasons why the aid he might thus give would be considerable. It is not only that a first-rate speech is a credit to the party to which the speaker belongs, but a long time has elapsed since the House has heard or the public has read a speech from Mr. BRIGHT; and novelty, as every one knows, has its charm. Besides, Mr. BRIGHT is not unpopular in the House even among his opponents, and the Conservatives, not unmoved perhaps by a wish to mark by contrast their feelings towards Mr. GLADSTONE, are apt to show a sort of good-humoured tenderness towards Mr. BRIGHT. After the history of last Session, it is needless to say how great a gain to the Ministry must be the accession of a colleague who has name and weight, and yet is not personally unpopular. Thus, from whatever point of view Mr. BRIGHT's resumption of office is regarded, it may be expected that, though he cannot do very much to help the Ministry, he will in all probability do something, and that he will be of service amply sufficient to justify his holding in these costly and extravagant times a Ministerial sinecure.

SPAIN.

THE Government of Madrid and loyal Spaniards in general have reason to be well pleased that the Admirals of the neutral Powers declined to interfere for the protection of Alicante against a bombardment. It was much better that the criminal attack of the rebel ironclad vessels should be repelled than that it should be prevented by foreign interference; but it is not easy to understand why a powerful English squadron should have remained in the neighbourhood of the combatants if it had no active duty to discharge. It is fair to assume that the English Government will be able to justify conduct which certainly requires explanation. In this, as in many other cases, the existence of the electric telegraph shifts the burden of responsibility from military or naval officers to the authorities at home. There can be no doubt that Admiral YELVERTON obeyed his instructions when he detained and when he surrendered the *Vittoria* and *Almansa*, when he insisted on a delay of the bombardment of Alicante, and when he afterwards allowed it to proceed. It may be conjectured that the atrocious project of an attack on an unoffending and unfortified town furnished an excuse for renouncing the further custody of a troublesome deposit. The Government of Madrid may perhaps have alleged that it was impossible to provide for the defence of the coast while some of its ships were in possession of the enemy, and while others were detained by neutrals. It is evident that the restoration of the captured vessels, combined with the original seizure, constitutes a violation of strict neutrality; but the Carthagena insurgents, with their convict crews, may think themselves fortunate in profiting by any fraction of the ordinary conditions of war. It is not known whether the Government of Madrid, which was represented at Alicante by a member of the Cabinet, wished that the neutral squadrons should prohibit an attack upon the town. General MARTINEZ CAMPOS, commanding the besieging force at Carthagena, on his arrival at Alicante objected to the delay which had been imposed by the foreign commanders, on the ground that it was desirable at once to recommence the action with the rebel cruisers. The municipality of the town took an opposite view of the expediency of immediate fighting, and ultimately Admiral YELVERTON attempted to please all parties by the compromise of redacting

the additional delay which he had required by two days. The defeat of the assailants seems to confirm the soundness of the Spanish General's judgment; but, as MARTINEZ CAMPOS has since resigned, it may be conjectured that the Government of Madrid disapproved of his proposals. It is not easy to understand why the Republican authorities should complain of an interpretation of neutral duties which has been highly favourable to their own interests. They owe their possession of the *Vittoria* and *Almansa* exclusively to the questionable interference of the English squadron with the insurgents. The arrogant injustice with which the American Government repaid the loyal neutrality of England during the Civil War proves the difficulty of satisfying belligerents. It is in the highest degree desirable that naval commanders should henceforth limit themselves strictly to the duty of protecting English subjects.

The failure of the enterprise against Alicante may perhaps induce the insurgent leaders to negotiate before their cause becomes absolutely and immediately desperate. Although they have now maintained their resistance for several weeks, no sign of friendly diversion on their behalf appears in any part of Spain. When Carthagena first declared its independence, PI Y MARGALL directed the Central Government with the aid of colleagues some of whom were strongly suspected of complicity with treason. Even after the accession of SALMERON to office, a minority in the Cortes still defended the cause of the rebels; and the Ministers were unwilling or afraid to enforce military discipline by the only effective means. The insurgents had reason to hope for aid from Barcelona, from Cadiz, and from other towns; and the power of the Carlists in the North was rapidly increasing. The tide has now, at least temporarily, turned. An honest and patriotic Minister is invested with dictatorial power; the Cortes are dispersed with little chance of re-assembling; seditious newspapers will be suppressed; mutineers will be summarily shot; and the artillery officers who had been necessarily driven to resign their commissions are restored to their rank. Although it is possible that the more desperate ruffians among the rebel chiefs may prolong the insurrection, the bulk of the population of Carthagena would willingly relinquish a useless and hopeless struggle. The superiority of the rebels at sea is probably at an end, now that the Central Government is once more in possession of the two captured vessels. It is true that the besieging force has thus far confined its operations to a blockade; but, on the other hand, the insurgents utterly failed in their attempt to break through the besiegers' lines. It is said that the reserves are at last responding to the appeal of the Government, and some successes appear to have been obtained against the Carlists. If CASTELAR is fortunate enough to obtain the submission of Carthagena, he will have been more successful than any preceding Minister since the proclamation of the Republic; and, with the support of the respectable part of the community, he may perhaps ultimately repair some of the mischief which he and his party originally caused. The vigorous decrees which he issued as soon as he had got rid of the Cortes indicate his tardy apprehension of the principles on which a turbulent population may be reduced to obedience and order. It matters little that the doctrines which he is applying in practice are the same which he has spent his life in denouncing.

In the final debate on the prorogation of the Cortes, CASTELAR amused himself by expatiating on the advantages which Spain has already derived from the last revolution. Some of the greatest States in Europe are, he said, still suffering under the institution of monarchy, while Spain enjoys the blessings of a Republic, of universal suffrage, and of theoretical freedom of person and of the press. Civil war, almost universal anarchy, threatened social revolution, and general uneasiness and alarm, are drawbacks to the general felicity which it would not have suited the orator's purpose to notice. There was a whimsical inconsistency in the complacent enumeration of privileges which were, with the exception of the name of a Republic, to be withdrawn as soon as the eloquence of the speaker should have been acknowledged by the assenting vote of the majority. The eulogy on constitutional freedom was used as an argument for the concession of dictatorial power; and as soon as the demands of the Minister were granted, he proceeded to suspend the nominal guarantees of personal liberty, to impose on all Spaniards the necessity of carrying passports, and to warn the newspapers that the publication of prohibited news or of seditious appeals will be punished by fine, and eventually by suspension or sup-

pression. It was hardly worth while to arrive at so simple a form of government by the roundabout road of a Federal Republic. PARR and his predecessors maintained the existence of society as often as it was menaced by precisely similar means; and if CASTELAR and his political allies would have aided the efforts of PARR or of King AMADRO to establish a regular Government, it might not now have been necessary to rule by force alone. Even a Spanish orator might have been expected to moderate his enthusiasm for universal suffrage at the moment when he was persuading its nominees that their presence and activity formed an insuperable obstacle to the restoration of order. The members of the Cortes who were exclusively elected by the Republican majority of the constituencies deserve credit for acknowledging the force of CASTELAR's appeal to their patriotic self-abnegation. The leaders of the Opposition insisted in vain that a Constitution should be voted before the Cortes separated. As it was universally understood that all constitutional guarantees were to be immediately suspended, the Cortes probably thought that a new edition of the Spanish Rights of Man was not urgently required.

In the same debate PI Y MARGALL professed his inability to comprehend how the Minister and his friends could reconcile their actual conduct with their former principles. He was shocked to hear one plain-spoken member of the Cortes declare that what the country wanted was not Republic or Federation, but peace and quiet. Finally, he asserted, with a suspicious excess of liberality, that even the Cantonal insurgents desired nothing more than to consolidate the Government of the Spanish Republic. As far as CASTELAR's inconsistency is concerned, Señor PI Y MARGALL has learned little in his long familiarity with public affairs if he is surprised to find that fine words are not always translated into corresponding acts. It is more natural that he should be puzzled by the honesty which avows in plain language an indisputable truth. The best proof that Spain cares comparatively little for a Republic or a Federation is that absolute power is almost unanimously delegated to a Minister for the exclusive purpose of enabling him to restore peace and order. It is scarcely patriotic to attribute to the insurgents of Carthage a laudable desire to maintain the Republican Government of Spain. It may be true that ROQUES BARCIA and his accomplices have drawn in practice a strictly legitimate inference from the empty phrases of Federalist declaimers; but in political matters rigorous logic sometimes approximates to treason. It matters little whether CASTELAR has in former speeches justified by anticipation the rebellion of Carthage. He is now determined that Spain shall not, in accordance with any theory, however plausible, be split up into fragments. For the moment he is doing his utmost to counteract the bad effects of the Republic. Once before within living memory a country agitated and alarmed by a causeless revolution has reposed its confidence in an orator who was deemed less reckless than his coarser Republican associates. The vanity and levity of LAMARTINE forfeited the confidence which had been inspired by his professions; but there is no reason why brilliant men of letters should always be incapable cockcombs. CASTELAR is right in silencing the demagogues, in restoring the discipline of the army, and in preparing for a vigorous prosecution of the war. When he has accomplished his task, he may be allowed to explain away at his leisure the most creditable portion of his career.

COMING ELECTIONS.

THE contest at Taunton is naturally regarded as one of considerable importance. It is the SOLICITOR-GENERAL who seeks re-election; and it is, to say the least, highly inconvenient when a Government finds one of its Law Officers rejected. Mr. HENRY JAMES has fairly won his promotion. He is a lively speaker, and his speeches are full of good matter, as well as pleasant to hear. He has not attempted to win professional advancement by tame subservience to the Government, and has shown sufficient independence to make himself respected; while his general support of the party to which he belongs has been unwavering. In ordinary times, when a lawyer so prominent in his profession obtains promotion in an unobjectionable and honourable manner, there is a natural disinclination on the part of his political opponents to impeach him. But when his opponents are pained with the thought that he is a man who has done so well, and who has so much influence on the policy of the Government, it is not surprising that they are perfectly justified in trying to win a seat at Taunton if they can. The only object of the rule which makes a seat vacant when a member accepts office is to allow the constituency he represents to intimate whether they approve of the general character and conduct of the Government he joins. Mr. JAMES is opposed at Taunton, not because he is made Solicitor-General, but because he is going to act as Solicitor-General under the Ministry of Mr. GLADSTONE. Fortunately for Mr. JAMES, it appears that he is not likely to be defeated on any of those side issues which are fatal to so many Liberals. Either his tact and good sense, or the wisdom and public spirit of his supporters, have saved him from the danger of overthrow on the slippery and treacherous questions of beer and the 5th Clause. Publicans and Dissenters are going to vote on general political grounds, and while this must be very satisfactory to the SOLICITOR-GENERAL, it will of course make the victory of the Conservatives, if they win a victory, more complete and decisive. They will have persuaded a constituency to reject a popular and able man, not because a portion of his supporters fell away from him from thinking the interests of drink or religious education imperilled, but simply because he has joined a Government of which the constituency disapproves. It must, however, be remembered that at the last general election Mr. JAMES was in a minority. He was eighteen below his Conservative opponent, but he demanded a scrutiny, and enough votes were struck off his opponent's list to give him the seat. It is evident that, under these circumstances, a very small change of opinion may now give the Conservatives a victory. The Conservative candidate is reported to have stated that, if all promises made to him are kept, he shall have a majority of seventy. A candidate of course makes the best of his own case, and this may be taken to show that the struggle will be very close. If a dozen Liberals who five years ago thought they liked Mr. GLADSTONE now fancy they dislike him, the SOLICITOR-GENERAL may lose his seat. If this is so, it will be very inconvenient to the SOLICITOR-GENERAL to be out of Parliament, and very inconvenient to the Government to let him remain out of Parliament or to find him a seat by some contrivance; but it would be absurd to seek any important indication of the general feelings of the nation towards the Government in the shifting humours of a dozen Taunton voters.

At Bath the contest is in many respects unimportant, except that it will be a very considerable success to the Conservatives if they can show themselves able to win both seats in an important city which at the last general election returned two Liberals by an incontestable majority. Both Mr. FORSYTH and Captain HAYTER are eminently respectable candidates, and both are perfectly fit to sit in Parliament if they can but get there. Both are moderate, sensible men, and if they met privately and honestly compared their political views, they would probably find that their single point of disagreement is that each wishes his friends to be in office. But Captain HAYTER is not so fortunate as the SOLICITOR-GENERAL. He is opposed by a small section of the Liberal party, utterly insignificant in itself, but able probably by its defection to seat the Conservative candidate. The candidate of this section, Mr. THOMPSON, is the representative of every mischievous crotchet which at present bewilders feeble minds. He is, of course, for the Permissive Bill, the extension of the franchise to women, and the repeal of the Contagious Diseases Acts. He has no hope of winning, and frankly says so in his address; but he hopes, by getting Captain HAYTER defeated, to bring the Liberal party to a sense of its duty. It is perhaps as well that the Liberal party should be brought to a sense of its duty; and its duty is to pass into the shade of Opposition rather than give any countenance to the pernicious theories of ignorant philanthropists. If the Liberal party in any constituency is in a minority unless it receives the support of men who in their ardent support of special whims entirely overlook the general interests of the nation, an honest and sensible candidate has nothing to do but to own that he is in a minority, and to abide by the consequences as cheerfully as he can. It will be better for Captain HAYTER himself, and infinitely better for his party and for the nation at large, that he should be defeated at Bath rather than be returned by humoring the fagades of Mr. THOMPSON's allies. On such points as those suggested in Mr. THOMPSON's address a man of character and courage is not likely to be swayed, and to stick to it. We observe that Mr. THOMPSON is a man of no small talents, and that he is a man who has done so well, and who has so much influence on the policy of the Government, that it is not surprising that he is perfectly justified in trying to win a seat at Taunton if he can.

We observe that Mr. THOMPSON is a man of no small talents, and that he is a man who has done so well, and who has so much influence on the policy of the Government, that it is not surprising that he is perfectly justified in trying to win a seat at Taunton if he can.

he refers to the Home Rule movement, and declares that if a large number of Home Rulers are returned for Irish seats at the next election, England ought to consider how far she can meet their wishes. This is a very poor way of trying to make friends with Home Rulers without absolutely going against the views of those to whom the idea of setting up a separate Parliament in Ireland is obnoxious. On such a subject a man fit to sit in Parliament ought to have an opinion. To concede the claims of the Home Rulers would be to make the gravest possible change in the constitution, character, and destinies of the British Empire. If Mr. Serjeant SIMON, after exercising his judgment as far as possible, has arrived at the conclusion that such a change is desirable, he is quite entitled to hold, avow, and advocate this opinion. But nothing can be more mischievous than that men should be returned for English constituencies who treat such a question lightly, and indicate that they are perfectly ready to take either side on it, and are only waiting to see which way the wind blows before they decide which side to take.

It seems not improbable that the Conservatives may win a seat at Hull. At any rate there appears to be a significant difficulty in finding a Liberal candidate with a fair prospect of winning. Mr. CLAY, the deceased member, had a majority of nearly five hundred at the last election, and the Conservatives may well be elated if in so important a constituency so large a majority is now to be reversed, or a Conservative candidate left unopposed. At Taunton, at Bath, and at Hull the prospects of the Conservatives are so good that the inquiry naturally suggests itself, what is to be the consequence if in one constituency after another Liberals continue to be defeated? A Ministerial journal has very imprudently attempted to make the Taunton election a sort of test contest, and has pointed out that the Government will be in a new position if one of its members is defeated. The history of the last election at Taunton ought to have been taken into account, and attention paid to the nice balance of parties there, before the Ministry was made to seem to associate its fortunes with the success of its new Law Officer. But if the seats at Bath and Hull are also lost, and if his SOLICITOR-GENERAL is looking about in vain for a seat, Mr. GLADSTONE may naturally ask himself what is his real position. A Minister cannot act with the necessary sense of self-respect and confidence who, in spite of his having a majority in the existing Parliament, feels convinced that the majority of the electoral body is against him, and wishes him out of office. If any man would feel this keenly it is Mr. GLADSTONE, among whose faults a tendency to cling meanly to office is certainly not one. But, however sensitive a Minister may be, and however willing he may be to resign office, or to test the real feelings of the country by a general election, he must always find it a matter of great difficulty to decide what conclusion he ought to draw from any given number of isolated elections. The feeling of the country may be sufficiently against him to reduce his majority, but not sufficiently against him to cut away his majority altogether. Mr. GLADSTONE may also reasonably doubt whether isolated elections held a few months before a general election must take place are really a true guide. Liberal inaction is one great cause of Conservative triumphs, and it is one thing for a Liberal elector to show his displeasure at the blunders of the Ministry by letting a Conservative sit for a few months, and quite another thing to let the representation of a borough pass to the opposite party for five or six years. That most people think that the Conservatives will gain largely at the next election is not a reason why Mr. GLADSTONE should be bound to dissolve now. It may be observed that, while some of the more eager Conservative journals and minor Conservative politicians keep calling on Mr. GLADSTONE to dissolve, and inveighing against him for holding office contrary to the real wishes of the country, the Conservative leaders maintain a discreet silence, and never hint that they or the nation are being injured by an election being deferred. There seems to be no general opinion that Parliament should be dissolved at an early date, and reasonable people of all parties are content at present to leave Mr. GLADSTONE to decide whether he will meet the present Parliament next February or not.

PARTIES IN AMERICA.

THE grave financial crisis in America will probably relieve embarrassed journalists from the necessity of discussing General GRANT's schemes for making himself

an absolute Sovereign. The causes of the money difficulty are clearly understood in England, and it will be matter for regret if the Government of the United States has resorted to any empirical attempt to relieve the pressure. But for the existence of an inconvertible paper currency, the arrival of gold from Europe would probably soon have enabled the banks to meet their liabilities. The amount of legal tender notes is necessarily restricted, and the payment of debts in gold is impracticable, because it would involve a bonus of ten or twelve per cent. to the creditor. Before the failure of Messrs. JAY COOKE and Co. public attention had been divided between the defeat of General BUTLER in Massachusetts and the combination of the farmers in some of the Western States against the Railroad Companies. The decision of the Massachusetts Convention was in the highest degree encouraging to those Americans who still retain their faith in the national institutions. No more scandalous result of popular suffrage has occurred than the attainment of high political position by one of the most discreditable demagogues in the United States. BUTLER's warmest admirers can never have supposed that he was either personally respectable or politically honest; yet he has for several years been returned to Congress by a district in the State which claims to be the most enlightened in the Union; and when he was on one occasion opposed, he defeated his adversary by an overwhelming majority. Notwithstanding the general distrust which he inspires, he may be considered the leader of the majority in the House of Congress; and since he has condoned the contumacious language in which General GRANT described his military character he has enjoyed the PRESIDENT's entire confidence and support. As the dispenser of Federal patronage in his own State he became candidate for the office of Governor, and at first it was generally expected that he would succeed; but it would seem that in Massachusetts there is a reaction against the lax principles and practices which have lately prevailed in the Republican party. The disreputable character of the Presidential candidate has at last tended to his disadvantage; and he finally found it expedient to withdraw his claims before the nominating Convention arrived at a formal vote. The skill which he is said to have displayed in covering his retreat can scarcely be appreciated without a minute knowledge of the machinery of American State elections.

As usually happens in similar cases, the immediate occasion of the decline in BUTLER's popularity was not the worst of his political acts. He had been the principal promoter of the measure for increasing the pay of the PRESIDENT and of the members of both Houses of Congress; and of the more questionable enactment by which the addition was made retrospective. In the elegant polemical language of the day, the proceeding is known as "the back pay salary grab"; and it is certainly open to criticism. There is no doubt that the salary of the PRESIDENT was previously insufficient; but a considerable grant on account of back pay seems to have been thought unjustifiable, and the active support given by the PRESIDENT to the principal author of the measure raised a suspicion of a corrupt understanding. Much graver imputations might have been suggested by BUTLER's previous political career, if the Republicans had not as a party been liable to the same charges. Six or seven years ago BUTLER was one of the most zealous advocates of repudiation, which was at that time approved by a large majority of the House of Representatives. He deserves credit for the adroitness with which he has now anticipated defeat, and avoided a rupture with his party. He may perhaps retain his seat in Congress; and he probably believes that his accession to the highest office in his State is only postponed. His intimate relations with the PRESIDENT prove that he is still regarded as a valuable ally; and, if it is true that General GRANT desires a second re-election, the management of the transaction may probably be entrusted to BUTLER. That a third term of office is not inconsistent with the text of the Constitution was probably a new discovery to many foreign observers of American politics. The refusal of WASHINGTON to be elected for the third time established a custom which had been supposed almost to acquire the force of law. Nevertheless the people of the United States can at their pleasure re-elect General GRANT, who has for the present no known competitor in the ranks of the Republican party. If the experiment is tried, it will be only surprising that an unprecedented honour should have been conferred on a candidate who certainly commands but little enthusiasm.

The agitation against railways which has recently arisen

in Illinois and other wheat-producing States probably explains the PRESIDENT's earnest recommendation to Congress of measures for improving the internal navigation. If the PRESIDENT could persuade the Western farmers that he was the promoter of a system of cheap freight, constitutional traditions would probably not be allowed to interfere with their support of his re-election. Unfortunately the relief which might be obtained by the construction of ship canals is remote, while a reduction of railway charges offers an earlier prospect of relief. The elections in many States are likely to be determined with reference to the sudden demand for cheap carriage. The battle will be fought with similar weapons on both sides; for if the railway corporations have comparatively little hold on popular feeling, they and their agents are accustomed to the management of State and Federal Legislatures, and they possess facility of combination and command of capital. One of the chief disadvantages to which they are exposed arises from the fact that the stock is chiefly held by Eastern capitalists, while the insurgent freighters command the votes of the West. A similar local distribution of debtors and of creditors seemed a few years ago likely to facilitate the repudiation of the National Debt. It was thought that the Western taxpayers might perhaps refuse to pay dividends to fundholders who for the most part resided on the Atlantic seaboard. The railway shareholders have no reason to rely on the moderation of the Western farmers, nor even on the inactivity of their political supporters. The railways have been constructed on certain terms under State legislation, and the corporations are only restricted in their charges by any tariff which may be included in their Acts. If the terms allowed to the promoters were liberal, it may be presumed that the railways would not have been constructed except in the hope of considerable profit to counterbalance obvious risks. The proposal of some of the advocates of the farmers, that the corporations shall only be entitled to earn ordinary interest on their capital, is utterly inequitable; but the constituencies which have already elected judges for the avowed purpose of deciding suits against railways will not fail to return Legislative Assemblies pledged to the same policy.

Happily economical obstacles are likely to thwart partial legislation. Unless the several States are disposed arbitrarily to take possession of the railways, they will scarcely be able to force the corporations to carry their produce at unremunerative rates. It may be possible to impose a limit on railway charges; but it will be almost impossible to compel the Companies to provide the accommodation which will be required. America is not a country in which the public wants can be supplied by forced labour. If it happens not to suit the purpose of any Company to run a train, those who wish to forward their produce at the particular time will inevitably be disappointed. The proposed remedy of making new and competing lines is absurdly impracticable; for an additional outlay of capital, even if it could be provided, would render necessary increased fares as the only mode of securing the necessary return. The capitalists as a body will ultimately control the action of communities which, as a general rule, are insufficiently provided with means of communication. On existing railways the owners have the power, by withholding facilities, of retaliating on the promoters of any unjust scheme of legislation. On the construction of new lines railway projectors can exercise an absolute veto. The States themselves have no means of competing with private projectors, for the prevalence of corruption and dishonesty would be fatal to any large scheme of public works. It is found impossible to prevent the members of a Legislature from deriving personal profit from public expenditure; and unfortunately the scandal of the Pacific Railway in Canada proves that the evil is inseparable from the social and political condition of the American Continent. It is for this reason that the best American politicians refuse even to consider General GRANT's proposal of a great scheme of internal navigation. It therefore becomes necessary to rely on private enterprise for material improvements; and capitalists will not embark in expensive undertakings unless they are secured against vexatious interference.

PROSPECTS OF THE FUSION.

THE Count of CHAMBORD has incidentally replied to the challenges so frequently addressed to him. We are all familiar with the convenient rhetorical artifice which

evades an inconvenient question by assuming that it must be unnecessary to answer it. The letter published in the *Union nationale* is very much of this character. "To be reduced," the Count of CHAMBORD says, "in 1873 to evoking the phantom of tithe, of feudal rights, of religious intolerance, of the persecution of our separated brethren, of a war madly undertaken under impossible conditions, of a government of priests, of the ascendancy of privileged classes"; and then, by way of predicate, he inserts a note of admiration, and adds that "things so little serious cannot be seriously answered." If the Count of CHAMBORD does not hold these charges to be worth a serious answer, it is a pity that he cannot prevent certain of his followers from giving constant occasion for their being brought against him. It is probably true that neither tithe nor feudal rights would come back with a Restoration—the Restoration which attempted to reimpose them would at all events be of very short duration; but then what is the meaning of the "social reconstruction" which the Count himself talks of in this very letter? To the imagination of the peasantry the principal difference between the state of France before and after 1789 consists in the presence at the former period, and the absence at the latter period, of these very burdens. If a social reconstruction is to be associated with a dynastic restoration, they will take it to mean that the old system is to be substituted for the new. It may be conceded that when the Legitimist journals dwell on the changes which are to follow upon the return of the BOURBONS to the Throne, they are thinking merely of political changes; but to the peasantry politics are only interesting in so far as they are connected with their land, and they are certain to interpret these aspirations after the past as implying a desire to subject them to all the burdens which they threw off eighty years ago. So too it is probably true that the Count of CHAMBORD has no inclination to undertake a war under impossible conditions; but what are the views of the Archbishop of PARIS upon this point? If his recent Pastoral was not meant to suggest to every good Catholic that, in going to war with Italy for the restoration of the Pope's temporal power, France would be carrying out the will of God, and consulting her own interests into the bargain, what was it meant for? There is no need to attribute any project of persecution to the Count of CHAMBORD; but when M. VEUILLOT says that France belongs to CHRIST by right of primogeniture, and that it is not made for people who don't like masses—that is, he adds, by way of explanation, for Liberals of all shades—he evidently wishes to see the people he has in view subjected to treatment which they might think hardly distinguishable from persecution. The reactionary writers who throw about these statements so recklessly are the writers who are most eager to see the Count of CHAMBORD seated upon the Throne. It may be that they have altogether mistaken their man, or at all events that they have under-estimated the influence which circumstances will exert upon him. But it is unreasonable to expect that the ordinary Frenchman who cares nothing about a Restoration will judge the Count of CHAMBORD more accurately than his own followers. He may well think it absurd to be reduced in 1873 to proving that these rumours are only phantoms; but it is his friends, not his foes, that have imposed this absurdity upon him.

At a time when encouraging symptoms are not too numerous, it is satisfactory that the attempt to form an alliance between the Radicals and the Bonapartists has altogether failed. The invitation addressed to Prince NAPOLEON by the Editor of the *Avenir national* has been universally repudiated by the Republican party, while Prince NAPOLEON's acceptance of it has been repudiated by the accredited Imperialist organs. There was reason to fear that the presence of imminent danger might have disposed the Republicans to catch at any weapon that offered itself, and this was evidently the expectation of Prince NAPOLEON. His letter to M. PORTALIS might have been written by the late EMPEROR when a candidate for the Presidency of the Republic. He is, he says, equally with the Radicals, a believer in the sovereignty of the people. There may be differences of opinion how this sovereignty is to be brought into action; but this difference need not interfere with the acceptance of the abstract principle. The attainment of true liberty based on the reforms which are essential to the welfare of France should be the common object of all citizens of modern society. Experience has shown that this agreement as to the end to be pursued is not incompatible with a very radical divergence

as to the means of pursuing it. Probably Prince NAPOLEON so far resembles his family that he would take the shortest way to rid himself of his Republican auxiliaries as soon as a favourable opportunity offered itself. Some time ago he was alleged to have said that there were no "Égalités" in the BONAPARTE family. We may be permitted, however, to doubt whether, if the Republican party had followed M. PORTALES's lead, the Prince would have been scrupulous in reserving the whole profits of the transaction for the PRINCE IMPÉRIAL. He may reasonably argue that the fortunes of the family ought not to be sacrificed because its head is too young to take charge of them. Some modification of hereditary right may be permitted in a dynasty which claims to rest upon universal suffrage; and if this be conceded, what modification can be so natural as the devolution of the succession upon the worthiest male? It would not have been surprising if a genuine difference of opinion had shown itself among the Imperialists as to the relative merits of Prince NAPOLEON and the PRINCE IMPÉRIAL as a party leader. The former has the advantage of being ready to take the command at any moment, and of being entirely free from any suspicion of clericalism. The latter is not yet of age, and for the present his opinions and actions would virtually be dictated by his mother, who is by no means free from this suspicion. On the other hand, if any magic still attaches itself to the name of NAPOLEON, it belongs to the ex-EMPEROR's son, not to his cousin; and in the present position of affairs it is in some respects an advantage for the party to have a good excuse for inaction. The traditional part of the NAPOLEONS is to restore order after a revolution; and if the Restoration of HENRY V. is really effected, there is every chance that the revolution which is required to provide this part for the third time will not be long wanting.

According to present appearances, if the Fusion breaks down, it will be not so much upon what the Count of CHAMBORED is to do as upon when he is to do it. If the Right Centre will consent to a Restoration without conditions, it is probable that the King would grant a not very illiberal Charter by way of reward for their unquestioning submission. But the notion of putting themselves absolutely at their Sovereign's mercy is not very palatable to men who have till lately been sworn upholders of Constitutional government, and they may at the last moment insist upon coming to some kind of understanding with the Count of CHAMBORED before making him King. A demand of this kind would probably be offensive to the Count, while it would certainly be offensive to an influential section of his adherents. It is of great importance to Royalists like M. VEUILLOT that the King of France should be fettered by as few engagements as possible. He is only valuable to his Ultramontane supporters for the ecclesiastical uses to which they hope to turn him, and for this purpose it is essential that his natural piety should be allowed its free course. A Sovereign who felt himself obliged, when the interests of the Church were at stake, to be guided by the counsels of his Ministers or the votes of his Parliament, would be a Sovereign who might fail them at the critical moment. When a pretender who dislikes giving pledges has at his back a party to whose designs it is essential that he should give none, there is a fair probability that the negotiations introductory to a restoration will not be carried through without a good many hitches. When the Assembly is again in session there will not be wanting skilful strategists to take advantage of each hitch as it occurs. During the recess the Fusionists have had everything their own way; but though the Government can suppress Republican newspapers, and throw difficulties in the way of Republican meetings, it can hardly silence Republican deputies, or prevent the circulation of the journals which report the debates in which they take part.

THE MAYORS AT YORK.

THE entertainment lately given at York to the Lord Mayor of LONDON was more interesting to the municipal constituencies which were represented than to the more ambitious class of politicians. Even theorists admit that local government is important; and if they would condescend to inquire and to observe, they would find that the display of municipal pageantry is almost universally popular. Several Corporations, immediately after their reformation five-and-thirty years ago, expressed their dislike and contempt for the close bodies which they had superseded by selling their maces, their chains, and their other outward symbols

of municipal splendour; but after a short interval the local dignitaries returned to the wiser conclusion that they were themselves not less worthy of outward decoration than their usurping predecessors. The custom by which the Mayor of a town presides on all public occasions of pleasure as well as of business has the indirect effect of limiting the choice of the constituencies to the principal inhabitants of the borough. Any chief magistrate who appeared to be ashamed of his robe and his badge of office would give just offence to his colleagues and his fellow-townsmen, who unconsciously feel that their corporate sense of importance is encouraged by external aids to the imagination. Several Lord Mayors of London have of late years judiciously assembled their provincial brethren at the table which is the recognized centre and type of municipal hospitality; and it was highly proper and becoming that the compliment should be returned. York, as the seat of what may be considered a Northern municipal primacy, with a Lord Mayor of its own, was fitly selected as the place of celebration, and the long list of Mayors who assembled to do honour to their chief sufficiently proved their general approval of the solemnity. The Lord Mayor of LONDON, knowing that philosophers had long since failed in the attempt to conceive him as a merely abstract being, sent his stato carriages and his other emblems of office before him, that he might proceed from the railway station to the local Mansion House as befitting his rank. The procession of municipal authorities extended for a mile, and they were attended in their progress by an enthusiasm which might perhaps not have been excited by as many members of Parliament. Burgesses and citizens are quite right in thinking that their immediate rulers ought to be regarded as conspicuous personages.

SIR SYDNEY WATERLOW dilated, as might have been expected, on the advantages of municipal government. A few days before, in supporting the candidature of Mr. FORBES at Dover, he had perhaps carried too far his natural preference of local interest to public expediency; but the affairs of towns, like those of private persons, are on the whole most efficiently managed when every one concentrates his attention on his own business. The Lord Mayor was fully justified in his complaint of the cumbrous enactments of the Borough Funds Bill, which has provided an awkward and insufficient remedy for a flagrant grievance. It had been decided by the Courts that, under the clauses of the Municipal Reform Act, Corporations could not apply the Borough Fund, as far as it consisted of rates, to the purpose of prosecuting, or even of opposing, any Bill in Parliament, or of engaging in the most necessary litigation. The Sheffield Corporation had, in the obvious interest of their constituents, opposed before the justices certain regulations proposed by the Water Company; they had appeared in opposition to Gas and Water Bills of vital importance to the borough; and on one occasion they had sought to acquire the gas and water by compulsory purchase. In all these cases the Gas and Water Companies had employed on their own side funds in which the ratepayers had a reversionary interest; and nevertheless they succeeded in throwing the whole expense of the various proceedings on those members of the Corporation who had taken an active part in protecting the rights of the community. The scandalous victory of the Companies induced Parliament in the Session of 1872 to pass a Bill for the application of municipal funds to the protection or improvement of the corporate property; but the Borough Funds Bill was mutilated in the House of Lords in such a manner that it is sometimes difficult and always troublesome to comply with its provisions. The desire expressed by the Lord Mayor to enlarge the powers of governing bodies was the more creditable because his own Corporation, having ample revenues independent of taxation, is exempt from the disabilities imposed on ordinary boroughs by the careless wording of the Reform Act.

A few years ago Lord GREY's Committee, appointed with reference to pending schemes of Parliamentary reform, reported unfavourably on the operation of the municipal franchise. There can be no doubt that in some boroughs the town-councillors have not represented the highest class of the community; and, as in more important elections, there has been some recklessness and occasional corruption; but, on the whole, the Municipal Bill has worked well, and Corporations have contrived to avoid in practice some of the most serious evils which might have been expected to result from household suffrage. In all but a few boroughs the constituencies have been guided in their

choice by local and practical motives rather than by political sympathies, and consequently the Corporations have attended to their proper business, instead of making themselves the instruments of demagogues or factions. As every Corporation, with two or three exceptions, discharges the functions of Local Board of Health, the control of the sewers, of the highways, of the lighting, and sometimes of the gas and water supply, provides sufficient opportunities of employment for active members of the governing body. The parsimonious tendencies which would naturally influence the ratepayers become wholesomely corrected and diluted by the delegation of authority to the Corporations. A Mayor or a leading Town-Councillor is not less anxious to signalize his term of office by some public improvement than to acquire the reputation of a strict economist. Nearly all the great commercial and manufacturing towns have, under the existing municipal system, erected convenient and often sumptuous buildings for the public use, and they are constantly extending their enterprises in the form of baths, of libraries, and of public parks and gardens. If it cannot be said of English traders as of early Romans that their private incomes are scanty, their common funds are large, and the purposes to which they are applied are liberal and sometimes splendid. The administrative system of Liverpool, of Manchester, of Leeds, or of Bradford, is comprehensive and efficient, nor is there reason to suspect in a single instance the existence of malversation, or even of culpable extravagance. The Mayors of English boroughs have a perfect right when they dine together to cultivate feelings of complacency. The Corporations, like all human institutions, may be capable of improvement, but they might be much worse than they are.

Sir SYDNEY WATERLOW would have deviated from English instinct and tradition to an extent wholly unworthy of a Lord Mayor if he had not placed his imaginary or fictitious privileges on the same level with his practical duties. He was, as he forcibly observed, Chief Judge, or first in the Commission of the Central Criminal Court, although he would be summarily restrained if he attempted to sentence a pickpocket, or even to put a question to a witness. In the same manner ordinary Corporations feel a just pride in their right to hold Quarter Sessions, where their Recorder administers justice on behalf of the Crown, from which he derives his appointment. Even in those departments where the Corporations exercise substantial power, the success of their administration is largely owing to the necessary confidence which they repose in professional agents. The surveyor or the engineer of a borough takes more interest in the works which he executes or superintends than in general or local politics. It is certain that he will to the utmost of his power cause the sewers or the pavements to answer the purposes for which they are constructed; and his authority shelters his employers from the censures of ratepayers impatient of taxation. The main reason of the general success of the government of Mayors is that, as constitutional monarchs, they have responsible Ministers in their Town-Clerks. The legal advisers of Corporations are for the most part men of sagacity and experience; and, having probably attained the height of their professional ambition, they have no interest which conflicts with their care for the welfare and credit of the borough. Any irregularity which may possibly exist in municipal elections, though it ought if possible to be corrected, is of secondary importance as long as the corporate affairs are uprightly and prudently administered. The rates, though they are sometimes high, represent for the most part a beneficial expenditure; and the debts of the municipalities have always been incurred under the provisions of general or special Acts for purposes which are useful, and not unfrequently remunerative. It was natural that the assembled Mayors at York should demand the concession of additional powers to bodies which have in the discharge of their proper functions deserved well of the country. They have done their work on the whole so creditably that it would be a wanton experiment to enlarge the sphere of municipal activity. Household suffrage has thus far disappointed unfavourable anticipations; but it is capable of being converted, like universal suffrage in American cities, into an instrument of oppression and fraud. Corporations invested with larger powers might perhaps deteriorate in character. The disreputable Aldermen of New York squander or appropriate to themselves ten times the amount of revenue which provides infinitely better administration for Manchester.

THE RAILWAYS AGAIN.

THERE is a peculiar significance which ought not to be overlooked, not only in the regularity with which railway accidents continue to occur, but in the circumstances under which they happen. There is no reason to suppose that railway managers have condescended to adopt any of the innovations which have lately been pressed on their notice by Board of Trade Inspectors and others. Facing-points are as numerous as ever, shunting on the main-line is steadily kept up, expresses dash through crowded and complicated junctions at the old dare-devil pace, and goods trains and passenger trains are still delightfully mixed up together. These are all parts of the great railway system which it would be sacrilegious to touch. It may be presumed, however, that railway managers, in clinging to this system, are at least trying to do what they can to make the best of it, and to present it in as favourable a light as possible. They must be well aware that they themselves, as well as their pet system, are now upon trial, and that public opinion is rapidly ripening for decisive action on the subject. Even if they did not know this otherwise, they must have learned it from the recent speech of the PRESIDENT of the BOARD OF TRADE. Mr. CHICHESTER FORTESCUE has not hitherto borne the reputation of a rash and precipitate statesman, nor is the atmosphere of his department violently stimulating. It can hardly be doubted that it was under the pressure of public opinion that he took upon himself the other day to address the Railway Companies in language to which they have certainly not been accustomed from the lips of Presidents of the Board of Trade, and which a former President who has just rejoined the Government will, we fear, be apt to think unmannerly. Mr. FORTESCUE asserted that the public had a right to call on Railway Companies, in cases in which human life was seriously endangered, not to spare outlay even at the risk of some diminution of their dividends. He even went so far as to declare that "the safety of the people" in the most literal sense of the word was a supreme consideration, and that if Companies showed themselves to be slow and niggardly in providing improved means of safety, Parliament would find it its duty to interfere for the protection of the public. He therefore warned the Companies that it would depend on themselves whether they would be left to make their lines safe at their own discretion, or whether Parliament would confer on the new Railway Commission, or on some other department of the State, the duty of enforcing measures for the safety of travellers. It is possible that, if Presidents of the Board of Trade had been more in the habit of speaking out in this style—some people may think it after all quite mild enough, considering all the circumstances—their appeals to the Railway Companies would have proved more effectual than has usually been the case. It is satisfactory, however, to find that one of them has at last caught the right tone, and it is to be hoped that the warning will not be without its effect. Anyhow we are bound to suppose that at such a time as this railway managers must be doing all they can to give their favourite system a fair chance, and that the whole of their staffs have been cautioned to be particularly attentive and alert in the discharge of their duties. And yet what is the result? Accidents every day, and sometimes even two and three in a day. The conclusion would seem to be inevitable that these incessant disasters are due, not to mere casual negligence and carelessness, but to the system on which the lines are worked. They are the necessary result of fixed and permanent causes, and they are regular in their recurrence because the causes are always in operation. Nor is it difficult to discover what these causes are. The Railway Companies are simply endeavouring to carry on an increasing business with inadequate machinery, which is kept in very indifferent repair, and with a still more insufficient staff of men.

This week there has of course been the usual series of so-called accidents. That unlucky Scotch tourist train has again come to grief—this time not on the North-Western, but on the Caledonian part of the route. It ran into a mineral break-van which was about to be shunted into a siding, and the fireman was killed. Happily no other lives were lost. The driver of the mineral train took it for granted that the tourist train was late, but it had on this occasion deviated into something like punctuality. On Friday week there were three collisions on different railways, besides one or two other accidents. On Saturday the

Irish mail, half an hour late, was run into at Crewe by a goods train. On Wednesday an express went off the rails between Liverpool and Southport, and next day there was a collision between goods trains near Sheffield. Some remarkable evidence has been given in regard to an accident on the London and North-Western. An engine-driver stated that he left Burton at half-past ten on Thursday night, and did not reach Crewe, about forty miles distant, until noon next day. There were many delays on the way, and he was kept waiting outside Crewe for six hours. The guard of this train, who was killed, had previously been on duty for seventeen hours at a stretch, with an interval of five and a half hours between the two turns; and he had complained that he was so sleepy that he could not keep his eyes open. One of the superintendents had, indeed, found him fast asleep in his van. A fireman stated that he himself also was so exhausted that he could not help sleeping on the engine. It appears that ten or fourteen wedge-motion engines are in use on the Burton line, the peculiarity of this description of engine being that it frequently refuses to answer the steam until a crowbar has been applied to the wheels. The drivers have to carry crowbars for this purpose, and one of them said that his engine sometimes stuck so fast that two men with crowbars were required to start it. It will be remembered that the North-Western officials who were examined at the Wigan inquiry asserted that their railway was kept up regardless of expense, and that everything was done which could be done to secure safe travelling. The overcrowded condition of Crewe station may be gathered from the fact that an engine-driver had to wait for six hours outside before he had a chance of getting in. Colonel TYLER'S official Report on the Wigan catastrophe attributes it to the excessive speed of the train when passing through a dangerous junction. It is remarked that in all cases where the highest speed is employed the highest conditions of security in construction and maintenance should also be provided; but it would appear that these conditions were not to be found at Wigan.

An examination of the circumstances of railway accidents shows that they are almost invariably caused by the reluctance of the Companies to pay for keeping their lines in good order. The enlargement of stations so as to diminish the necessity for facing-points and to prevent main-lines from being turned into goods-yards, the provision of continuous brakes, the employment of an efficient and not over-worked staff, and so on, are all mere questions of money, and it is simply because the Companies will not spend the money that accidents happen. The traffic on the railways has increased enormously within the last ten or twelve years, but the accommodation provided for it has remained almost stationary. The rise in the cost of coals, iron, and other materials and in wages has made the Companies extremely anxious to retrench in other directions; and competition has taken the form of rivalry in reduction of expenditure. All repairs that are not absolutely indispensable are postponed indefinitely, while repairs which cannot be postponed are patched up anyhow. At the same time that the lines are starved, they are overburdened with rapidly increasing traffic. Goods and passengers are worked over the same rails in glorious confusion, while excursion trains supply an additional element of bewilderment and peril. The Companies appear to be under the impression that they can extend their trade while curtailing their expenses; but the experience of the present year will probably convince them of the hopelessness of the attempt. Money which is saved in one way is lost in another, and damages for accidents will absorb the economies which produced them. The statistics of railway accidents show a sudden increase since 1868. Although the number of passengers killed by causes admitted to be beyond their control was last year only about half the number of those in 1870, yet it was double that of 1871. An attempt has been made to persuade the public that there is a very trifling average of disaster, not worth making a fuss about. A daring statistician read a paper at the recent meeting of the British Association to show that the chance of a railway passenger being killed is almost infinitesimal, he being forty-seven times safer than an ordinary passenger in the streets of London. The comparison is obviously fallacious, inasmuch as it leaves out of view the difference between the amount of time spent in the streets and that spent in occasional journeys by railway. But even if it were sound, it would be worthless as an argument in favour of the reckless management of railways. The question is not how many people the railways should be al-

lowed to kill in a year, but how many they can avoid killing. Every death which is due to causes which might have been prevented by a little more care or by more liberal expenditure must be reckoned as a manslaughter against the Companies; and there can be no question that the great majority of railway accidents are preventable, if proper precautions are observed. All this has of course been demonstrated many hundred and thousand times already. The only use of repeating the remark is to prevent the public from lapsing into apathetic resignation.

THE UNSEAWORTHY SHIPS COMMISSION.

THE preliminary Report of the Royal Commission appointed to inquire into the alleged unseaworthiness of British Registered Ships is by no means an encouraging document; but, although it will produce disappointment, it will hardly surprise those who bear in mind the circumstances under which the Commission was appointed, and the manner in which its investigations have been conducted. The Commissioners were directed to inquire generally into the subject of unseaworthiness, whether arising from the faulty construction of ships, decay, overloading, undermanning, or any other cause, and to suggest any amendments in the law which might remedy or lessen such evils as might be ascertained to exist. At the same time an official intimation was given that the Commissioners, in investigating the loss of life at sea in consequence of ships being sent out in an unseaworthy condition, were expected to be careful not to wound the feelings of shipowners who might be guilty of such practices by going into personal questions. As the Commissioners sat with closed doors, and as the evidence which they have taken has not yet been published, it is impossible to say how far they have acted on Mr. FORTESCLE'S suggestion; but shipowners have certainly no reason to complain of the tone of their preliminary Report. It is difficult to understand why it should have been thought indispensable to the success of this inquiry that it should be conducted in absolute secrecy. It is probable that many persons will read the Commissioners' Report who will not have either the opportunity or inclination to read the bulky volumes of evidence which will hereafter be published; but if the Commissioners had sat in open Court, and if the evidence had been reported in the ordinary way from day to day, the public would have been able to form an independent opinion on the subject. There is another disadvantage, and it is a serious one, connected with the concealment of the progress of the inquiry. If the examination of witnesses had been conducted in public, other witnesses might have been induced to come forward in order to clear up any doubtful points, or to confirm or contradict statements which had been made. In this way the Commissioners themselves would have had the benefit of having the whole evidence thoroughly scanned and sifted before attempting to form their own conclusions for the guidance of the public. The secret examination of a limited number of selected witnesses is obviously an imperfect substitute for an exhaustive inquiry. The Commissioners explain that, owing to the number and extent of the subjects included in their inquiry, they are not yet prepared to make a final Report; but they believe that their researches, as far as they have been carried, will show the difficulties by which the inquiry is surrounded, and will prepare the way for the legislation which may be necessary. It would perhaps be a more correct description of the preliminary Report to say that it is apparently intended, not to prepare the way for legislation, but to discourage and discredit any effort to legislate in any way upon the subject. The Commissioners do not attempt to deny that unseaworthy ships are sent to sea, and that there is a large annual loss of life in the merchant service. They even admit that this loss of life might be diminished if certain precautions were enforced; but all their energy is expended in showing that precautions would be very troublesome, and might not invariably yield the results anticipated from them, and that therefore it would be better just to leave things as they are. The whole Report, in fact, breathes a spirit of helpless resignation. The Commissioners are obliged to acknowledge that there is a limit beyond which no sea-going vessel can be safely immersed, and they also refer to the rule of the Salvage Associations of London and Liverpool, of three inches of freeboard per foot of hold, as having been found practically convenient. But then there would be difficulties in the way, first, of laying down a fixed and universal rule,

and next of enforcing it, and so the Commissioners report against attempting to establish one. Next we are told "that it is confidently asserted that many hundred old wooden ships, which their owners will not repair, and which are unseaworthy, are habitually sent to sea." We are also informed that "competent witnesses state that many merchant ships are built with bad iron, that they are ill put together, and sent to sea in a defective condition," and that "they are lengthened without additional strength, and are thus weak ships"; and the Commissioners themselves think it "probable that, in the race of competition among shipbuilders, inferior materials and bad workmanship are admitted into ships." The Commissioners also express the opinion that, if LLOYD'S system of survey and classification were made compulsory on all merchant vessels, many unseaworthy ships would be stopped; and they quote the evidence of the Surveyor who examines vessels taken up on account of the Indian Government—an officer of great experience, who has been in the habit of despatching two hundred vessels a year—to the effect that vessels well built and equipped, with the amount of freeboard and the carriage of dead weight regulated, and deck cargoes prohibited, can perform the voyage to India in almost perfect safety. Moreover, the establishment of Registry Societies and Salvage Associations is referred to as a proof that, in the judgment of prudent shippers and shipowners, some inspection of ships is required; "such an extensive system of survey would not have been organized except from a well-founded conviction that many ships are unseaworthy from faulty construction, insufficient repair, or reckless overloading." All this, it might be thought, would lead up to a recommendation in favour of a survey of ships in some shape or other. But no; there are difficulties in the way, and so the Commissioners shrink back dismayed. Again, "witnesses are unanimous in testifying to the danger of deck cargoes across the Atlantic in winter, shipowners admit the desirability of their prohibition, if it could be generally enforced," and "the Canadian Parliament has lately regulated deck-loads from Dominion ports during the winter months." Still the Commissioners cannot muster up courage to advise the prohibition of deck-loads. The net result of the inquiry up to the present moment is simply that the Commissioners are as yet unable "to offer with any confidence any recommendations on this subject"—that is, the means of preventing unseaworthy ships from being sent to sea. All that they can do is to direct "public attention" to it. It will be thought that this is a somewhat imbecile and abortive conclusion.

It will be observed that the Commissioners call this a "preliminary Report," and that they reserve various points to be dealt with in a final Report; but there is no apparent reason why a preliminary Report should be published at all. If the opinions of the Commissioners are not matured, it would have been better for them to wait another month or two before saying anything. The only theory on which we can account for the curious document just issued is that the Commissioners were anxious to prepare the public for a proposal to shirk the whole question, and thought it would be convenient to have a final Report to fall back upon. They do indeed hint at the expediency of punishing shipowners through whose negligence lives are lost; but in the same breath it is suggested that a law of this kind would probably not be enforced. To some extent we are disposed to agree with the Commissioners in their objections to a compulsory survey and fixed load-line; but for very different reasons from those which have influenced their judgment. They intimate that, while keeping in view as their great object the preservation of life at sea, they deem it important to interfere as little as possible with "the freedom of British enterprise, the inventive genius of the British shipbuilder, and the property of British shipowners." Most persons who read the Report would, without this assurance, have been in danger of arriving at just the opposite conclusion. Every proposal for saving life at sea is met by the prompt rejoinder, "Oh yes, that might save life, but it would be very bad for trade; and therefore it is not to be thought of." The load-line is disposed of on the ground that "a shipowner of great experience considered that a fixed load-line would compel the British owner to sell his ships or put them under a foreign flag; and owners of small coasters unanimously declare that such a law would ruin their trade and send them to the workhouse." The Commissioners are also opposed, on similar grounds, to the prohibition of deck cargoes. In their eyes saving life

is as nothing compared with the profits of shipowners. It is a strange and melancholy example of the demoralizing idolatry of commercial interests to find a body of distinguished Commissioners gravely propounding the theory that nothing must be done to prevent sailors from being drowned in leaky or overloaded ships if it interferes in any way with the current rate of trading profits. This line of argument is not indeed a new one; it has been repeatedly employed against the various extensions of the Factory Acts, and happily without effect. Restrictions have been imposed on a great number of trades with a view to the protection of life and limb, and there is no reason why similar restrictions should not be imposed on the shipping trade as well, if it can only be shown that they would be effectual for the purpose in view. It is impossible to imagine anything more monstrous than the suggestion that, because other nations send out crews to perish in rotten ships, English shipowners must also be permitted to enter freely into this homicidal competition. The only solid objection to the various reforms which have been proposed by Mr. PLIMSOLL and others is, not that they would diminish trading profits—that must be utterly set aside—but that they are impracticable. Ships vary so much in size, build, equipment, stowage, and in other respects, that it would be very difficult to lay down a fixed code of rules which could be applied with equal justice all round, while it would be comparatively easy for shipbuilders to build really dangerous ships while complying with the letter of the law. It cannot be said that a system of surveying which is practised by several large and important associations, and also by various branches of the Government, is impracticable, but no doubt difficulties would arise if, from being purely voluntary, it were to be made compulsory. It will probably be found to be more convenient to apply compulsion indirectly, by fastening upon every shipowner the responsibility for the safety of his ships, and coming down on him severely whenever one of them is lost. In that case a certificate by a competent surveyor would naturally be an important element in the case for the defence, while the absence of a certificate would tell in a corresponding degree against an owner on his trial. A shipowner who is guilty of deliberate recklessness should of course be liable to criminal punishment. Instead of a fixed load-line, a mark might be painted on the side of the vessel as a guide in calculating the extent to which she is loaded. In endeavouring to save the seaman's life the great object should be to enlist his services in his own defence, and to supply him with the means of securing summary redress. The Commissioners are of opinion that the present system of inquiry into wrecks is defective, but they wish to take more evidence before making any suggestions. It is to be hoped that they will also take into consideration the tribunals by which disputes between seamen and their employers are adjusted, and which until lately almost invariably decided against the men. Indeed it was only last year that several seamen were sent to prison for deserting from a ship where they were drenched with water and kicked and beaten by the officers.

QUANTITY AND QUALITY IN EDUCATION.

IN the conflict with popular ignorance, the one thing needful is union among the friends of education. With this, ultimate victory would be certain, though a great deal of hard fighting might still be required to secure it. Without this, even the issue of the struggle is doubtful—doubtful, that is, in the sense of its being uncertain whether universal education will come in time to prevent the occurrence of disasters against which it is the only adequate safeguard. The charge which we have most often brought against the Education League is that they have adopted a policy which creates disunion where union is so much wanted. On all sides the question how every child in the country is to get an elementary education which shall be worth having is in danger of being forgotten. The Denominationalists are in arms for the maintenance of State aid to voluntary schools. The Secularists are in arms for the withdrawal of State aid from voluntary schools, and the creation everywhere of School Boards and School Board schools. Instead of considering how to get every child into a school of some sort, and to ensure that, whatever the sort be, the secular education given there shall be sound and sufficient, the time of both parties is largely spent in calling each other atheists or obscurantists, and in debating how the number of this or that sort of schools can be kept down. In this unhappy

rivalry the Secularists, as it seems to us, were the first offenders. We have never been ardent admirers of Denominationalism in elementary education, and we are very far from sharing the views of the National Society in regard to the Education Act. But the quarrel, in itself so infinitely petty, about the 25th Clause, was originated by the Education League; and it is to this, and to the theological passions that have grown out of this, that the present attitude of the clergy is mainly attributable. Those, however, who reproach the Secularists with postponing educational to controversial considerations need to be especially on their guard against erring in a similar way. We have said nothing about Mr. MORLEY's first two articles in the *Fortnightly Review*, because they dealt with matters about which it seemed useless to argue further. But the third article touches upon ground which is in some measure common to us both. If we differ from his conclusions, we agree with some at least of his premises. We can accept all he says of the urgent need of education. We are as convinced as he can be that it would be a substantial gain if English labourers "could all talk as articulately, as rationally, and as instructedly, and could take 'care of their interests as acutely,'" as the Scotch labourers. We admit that ordinary skill in reading and counting would go some way towards making the English peasant more independent of the village shopkeeper, more competent to set up a co-operative store, or to supervise the accounts of a benefit society, and less obliged to take every representation made to him on trust. We admit that the political changes already made, and the further changes impending, make it more than ever important that the labouring class should possess these advantages. We do not "forget that these ignorant 'multitudes are now what they never were before—the 'political masters of the realm.'" We know that the votes of those who cannot read a newspaper "can carry elections, 'change administrations, decide policies.'" We are well aware that "the same classes who are now believed to be 'on the point of following the publicans and the clergy to the polls, to the strangely compounded cry of an open 'Bible and a flowing barrel, are one day very likely to 'invent cries of their own.'" And, further, we agree with Mr. MORLEY as to the worthlessness of much that now goes by the name of education. We have no more love than he has for a system under which a large percentage of the children qualified for examination by attendance are not considered fit to be examined, while, of those actually examined, more than half a million were last year presented in the three lower standards, and only fifteen thousand in the highest standard. An education which stands for ability to read a short paragraph from a reading-book, to write a sentence slowly dictated by a few words at a time from the same reading-book, and to work sums in long division and in the compound rules so far as they deal with money, is in our judgment, as much as in Mr. MORLEY's, hardly an education at all. Where there is so much agreement there is a possibility at all events of further agreement. When it is so long before we part company, it is worth while to inquire why we need part company at all.

It is when Mr. MORLEY comes to explain why much that now goes by the name of education is worthless that we think him altogether in the wrong. His simple theory is that it is all the fault of the clergy. Education is bad because it is not the object of school managers to give education. They are only anxious about children's souls, and the sole motive which leads them to trouble themselves about their minds is the hope of getting at their souls through their minds. The material for these strictures is almost all drawn from the reports of School Inspectors. These reports are to all appearance exceedingly frank in their statements, and it is difficult to believe that, if the writers had suspected that the failures they deplore were traceable to the want of any desire on the part of school managers to give the children in their schools a good education, some of them would not have given expression to their suspicions. These Inspectors however, without, we believe, a single exception, account for the failures under the present system in one of two ways—the absence of compulsion, and the proscription of too low a minimum of proficiency by the Education Department. They admit that it is a disgraceful thing that so few children should be presented in the higher standards; but they ask what else can be expected so long as children are taken away from school at ten if they are meant for a trade in which the half-time rule is not in force, or not sent until they are ten if they are meant for a trade in which the half-time rule is in force?

Mr. MORLEY will hardly say that the hatred of the clergy to education goes so far as to make them positively anxious to see their school benches empty, or that their object is to have the children's souls under their influence for as short a time as possible. He does say, however, that the clergy are not zealous for education because, while admitting compulsion to be indispensable, they dislike the machinery which the Education Act has provided for the application of compulsion. In other words, though they wish for compulsion, they dislike School Boards. But whose fault is it that they dislike them? Mainly the fault of those who have presented School Boards, not as engines of compulsion, but as engines for the destruction of voluntary schools. If it had been clearly understood that School Boards might be created, and were intended to be created, purely for the purpose of bringing compulsion to bear on the parents, and not for the purpose of setting up new schools where new schools could only be filled by emptying those already in possession of the field, the clergy would have viewed them with very different feelings. Besides this, a clergyman has no guarantee that a School Board will resort to compulsion. It is not obliged to do so, and many of the Boards already elected have not done so. The way to improve this state of things is not to call upon the clergy to welcome a machinery which, instead of filling the empty benches in their schools, may content itself with creating additional empty benches to be filled, but to pass a law to enforce school attendance everywhere. Not at all, answers Mr. MORLEY; there can be no more gross illusion than "to leave quality as it is, and devote all 'our efforts to augmenting quantity.'" If a choice had to be made between the two ends, we might perhaps assent to this statement. But, as a matter of fact, the road to quality lies through quantity. As regards quality, the Education Department has the managers of voluntary schools under its thumb. It can raise its standard as often as it likes, and to any height it likes, and its annual Reports show how profoundly it is dissatisfied with the level at which the standard at present stands. Why, then, does it not raise it more rapidly? Simply because, with the existing infrequency and irregularity of attendance, to raise it, except by very slow degrees, would be to demand impossibilities. Once ensure that all children between five and thirteen shall be at school, and shall attend school regularly, and the Education Department will no longer have its hands tied. The new Code has introduced the principle that the results for which the State pays shall be proportionate to the age of the children. As yet the application of this principle is extremely gentle. The Department has only gone the length of giving notice that, after the 31st of December, 1875, no day scholar above nine years of age will be examined in the Second Standard. But the Inspector from whose Report Mr. MORLEY quotes the seemingly damning statement that "at present 'vast sums of public money are granted on the examination of children who, by reason of the disproportion 'between their age and attainments, offer little or no 'promise that their so-called education will be of any 'lasting benefit either to themselves or to the State,'" admits that this new regulation, and *à fortiori* any more stringent regulations, "presupposes compulsory attendance 'to have been some time enforced.'" At present it is impossible to insist that school managers shall make fair scholars of the children who attend their schools, because there is no saying how long or how regularly they attend them. Until the raw material on which the teacher has to work is brought and kept within his reach, it is idle to expect him to make much out of it. Compulsory attendance and the exaction of an adequate standard of instruction as a condition of a share in the Parliamentary grant are reforms which must go hand in hand. The second is impossible without the first; the first is practically worthless without the second.

THE SOCIAL SCIENCE ASSOCIATION.

WE hardly know whether we should or should not congratulate the Social Science Association upon their choice of a President for this year's Congress. Nobody indeed will deny that Lord Houghton has some rare qualifications for such an office. The first duty of a President on such occasions is to make things pleasant. Courtesy to all men, even to bores, and a happy turn for soothing silly susceptibilities and encouraging modest merit are excellent qualities in all cases; and nowhere more excellent than in a meeting of fretful would-be philosophers, male and female, each bursting with a sense of the extreme value of his or her own nostrum, and anxious to force it upon the notice of the

mimic Parliament. So far, the Association could not have made a better choice; but then, it must be added that Lord Houghton has one conspicuous defect to set against his general merits. It is, indeed, a defect so glaring that we do not understand how it can have been overlooked, and still less how, if not overlooked, it could have been pardoned. Doubtless he will listen patiently to an intolerable discharge of blue-book; he will soothe, as far as it can be soothed, the restless vanity of the vainest of mankind—of those people, namely, who have a secret for the instantaneous reform of the world; and more than this, he has proved that he can treat reasonably of the vast series of topics upon which men of social science delight to pour themselves forth. But granting all this, and more, how could it be forgotten that Lord Houghton is guilty of a weakness so radically opposed to the very essence of the Association's principles, that it must make all the philosophers uncomfortable whenever they look at him? In short, Lord Houghton has a sense of humour. Now humour is to that kind of discussion which forms the staple of Social Science oratory what a certain powder is to parasitical insects, or Loly water to the agents of diabolic power upon earth. The very first condition of listening patiently to the harangues of the amiable enthusiasts of Norwich is an incapacity for smiling; and if an heroic sense of duty should enable Lord Houghton, as we have no doubt that it will, to maintain his features in their usual repose, is it right to expose an innocent fellow-creature to the torment of forcibly suppressing throughout many days his natural impulse to obey his perception of the ludicrous? Everybody knows by sad experience the tortures undergone even by a person of reverent mind who is suddenly overtaken by a disposition to laugh in church. The poorest little absurdity seems to be more laughter-moving in such a position than the keenest wit under ordinary circumstances. The victim who contrives forcibly to suppress his convulsions says to himself, I must laugh or burst; and, if it is bad enough for a humble member of the congregation, the trial, we should suppose, must be tenfold greater when it happens to the clergyman in his pulpit. Moreover, if one is unfortunate enough to laugh during Divine Service, no great harm is done except to the criminal himself. The solemnity of the performance rests upon too deep a foundation to be disturbed by any little spasm of hilarity. But in debating societies of all kinds—and the Social Science Association is of course nothing but a big debating society—everything depends upon its members preserving their gravity. If they do not take their own rules seriously, there is no external power to give them support. When once one augur begins to laugh in his neighbour's face the augur's profession is ruined; which fact, as we may incidentally observe, explains how it is that augurs keep their faces so successfully. And therefore poor Lord Houghton must feel that he is not merely bound by a sense of courtesy to be grave, but that the very vital principle of the Association depends on his success. He must often think of Pope's touching lines:—

To laugh were want of goodness and of grace,
And to be grave exceeds all power of face.
I sit with sad civility, I read
With honest anguish and an aching head.

And doubtless he wishes that he could "whisper in unwilling ears the saving counsel" to his tormentors to keep their papers locked up at least until the next meeting of the Congress.

Lord Houghton is a human being; and therefore we are not surprised that under these conditions he should have indulged in a little quiet humour at the expense of the Association. This, at least, is the interpretation which we venture to place upon his inaugural address. After the ex-President had confessed with touching simplicity that "during the period of his incumbency there had not been any very great practical and accomplished results in the field of social science," and that it had been rather a period of "preparation and discussion than of realization"—or, in plain words, that all the talk had so far ended in smoke—Lord Houghton gave the simple explanation of this not very surprising phenomenon. He said, in substance, that there was at present no such thing as social science; he added that very probably there never would be any such thing, and observed that, if there ever was, it was very doubtful whether it would be of any use. These remarks were excellent in themselves, and we hope that the philosophers were edified. After this exordium, Lord Houghton went through a long and clear exposition of what has been done or left undone during the last year in most of the departments of practical life upon which the discussions of the Social Science Association are supposed to exercise an influence. Though Lord Houghton did not himself make the comment, it must have suggested itself to many of his hearers that the natural and social machinery had in all these cases worked pretty much as if the Social Science Association had never existed. Whether this address, upon which of course we have put our own interpretation, was calculated to please the philosophers, is more than we know, but that it was in itself very edifying we have no manner of doubt; and we hope that some of them may draw from it the inferences which Lord Houghton, even if they were present to his mind, could not have openly expressed. Covert satire, however, is apt to be lost upon the people who seriously believe that they are reforming the world by attending these gatherings of amateur reformers of mankind; and therefore we will venture to express a little more openly the reflections which occur to every man of ordinary sense when he sees some half-dozen columns of the *Times* filled with reports of such proceedings.

When the wicked—by which we mean ourselves and the outside world generally—say to the Social Science enthusiasts, You are bories; the enthusiasts reply, You are cynics. There is very little advantage to be gained, as a general rule, by bandying such names backwards and forwards. "Cynic" is a word which is used vaguely enough, and seems to be thought applicable to anybody who does not sympathize with any other person's nonsense. If, however, it is meant to imply that we do not care for the Social Science Association because we do not care for the objects which it is intended to promote, we repudiate the accusation altogether. We admit that the Association discusses many matters of the highest importance to mankind. The improvement of the law, the diminution of drunkenness, the spread of education—these and fifty other subjects must be interesting to every one who wishes to see our children a little better off than ourselves. We complain of the Social Science Association not because it discusses grave questions gravely, but because it often tends to make grave discussion more difficult. We fully admit that here and there it brings out useful ideas, increases our knowledge of facts, and brings together people who may co-operate in advancing needed reforms. Like some other things, it has its uses, and we do not wish to deny it any amount of gratitude which it may fairly claim. But we must add that the claims which it puts forward and the general spirit of the proceedings are to our mind unfortunate. The very title of the thing is an objection. To talk about science where there is undoubtedly no science may be regarded as a bit of harmless vanity, but in fact it encourages a mischievous confusion of ideas, of which we constantly see the results. Political economists, who have more right than the students of other of the so-called moral sciences to dignify their pursuits by the name of scientific, have done much mischief by the exaggerated form in which they have put forward their claims. We need not illustrate so familiar a fact, but we may add that their example has encouraged everybody else who has got hold of some little nostrum for the improvement of society to give himself the airs of a scientific observer. In old days much mischief was done to genuine religious feeling by fanatical pretenders to inspiration. At the present time, pretensions almost equally obnoxious are sheltered, in compliance with modern tastes, under the convenient cloak of a pseudo-scientific jargon. It is plainly desirable that, as we are at the present moment in a pre-scientific stage in all that regards social phenomena, we should begin by confessing our ignorance. A recognition of the empirical nature of our knowledge is the first condition towards its sound extension. The evil is not confined to this, but many people are encouraged to talk very pompously about matters which they do not in the least understand. The worst of it is, that they tend to discourage those who have better means of knowledge. As we have not yet established any general principles deserving the name of scientific from which we might deduce their application to particular cases, we ought to give attention to persons who at least have accumulated a considerable store of empirical knowledge. To take a particular case, nobody can determine from any general theory of human nature what is the proper course to be adopted in regard to criminals. If this were really a scientific question, we might apply to some closet philosopher who had analysed human nature into its elements, and ask him to explain by what chemical process we could arrest the progress of decay in the moral tissues. As this is impossible, we can only judge of the best means of cure by listening to people who have had really wide practical experience in the matter. The Prison Congress which assembled some time ago consisted chiefly of men who had a right to speak about questions the practical solution of which had been the employment of their lives; and, though perhaps they did not throw any very great light upon the subject, they at least brought to each other's knowledge what was being done, and with what success, in different countries. On all such points, in short, it is a condition of useful inquiry that respect should be paid to experts rather than to general speculators. It is earnestly to be hoped that such questions as the propriety of capital or corporal punishment should be decided by people who know the criminal classes, and not by people who have learnt a few platitudes from theoretical philanthropists.

Now the natural tendency of the Social Science Association is to lower the authority of the expert as compared with that of the fluent gabbler. It is an immense advantage possessed by the British Association that, as a rule, due respect is paid to eminence in special branches of inquiry, because the eminence can be easily tested. No mere dabbler in mathematics would dare to pooh-pooh Professor Maxwell, nor would a popular phrenologist venture to meet Professor Ferrier. But the members of the Social Science Association are all more or less omniscient. Anybody can talk passable nonsense about school reform or the social evil; and the orator who can talk the fastest and bore his hearers with the smallest infusion of facts and statistics is likely to receive the most attention. A volunteer Parliament, the members of which have not been taught to know who are the really competent leaders, becomes a perfectly chaotic body in which the nonsense is most likely to come to the surface. A meeting of doctors might usefully discuss sanitary questions, or a meeting of schoolmasters the prospects of education. But the very object of the Social Science Association is to bring together an unorganized mass of debaters upon so vast a variety of subjects that it is impossible for any human being to be more than a scatterer in some of them. If a man of real authority has got

anything to say, the chances are that he will get a hearing in some less distracted collection of universal discussion. He will try to speak to an audience more or less fitted to appreciate his special arguments. If, by some strange infelicity, he chooses to disburden himself to the Social Science Association, he will be jostled by a crowd of smatterers, each with as good a right as himself to speak and as good a chance of being heard; and the probability is that the audience will rush off to a room where some more popular and racy topic is under discussion, and leave him discoursing to bare benches. In short, the very idea of the Social Science Association is almost fatal to any satisfactory discussion of serious subjects which require special qualifications. It offers a premium to proficients in the art of talking twaddle about matters which they don't understand; and unluckily that art has already been brought to such perfection that it is one of the most serious evils of the day. The difficulty of getting Parliament to attend to important reforms when they do not happen to be matters of popular interest has long been acknowledged, and is not likely at present to be diminished. It is only one branch of an evil which exists on a larger scale throughout the country, and which the Social Science Association seems especially intended to encourage. It tends unconsciously to become a machinery for advertising every kind of social and political quackery, and helping the quacks to drown the voices of the sensible men. Fortunately there is the remedy that its proceedings have become too dreary to attract much attention; and that nobody who can get a paper into a second-rate magazine need care to read it before a section at Norwich.

THE LESSON OF CONTINENTAL LEISURE.

MANY wise men, both before and since Lord Bacon, have counselled travellers to observe the ways of the divers conditions of men amongst whom their path lies, and to profit by the examples and warnings to be gathered from them. It is perhaps a drawback to the increased facilities of travel in modern times that they reduce to a minimum the necessary points of contact with one's fellow-men of other lands. Indeed in the most frequented resorts of the Continent it needs a positive effort for an Englishman to detach himself from the regular stream of his countrymen, and to see things with his own eyes, and not through a medium of English guide-books, English-speaking attendants of colourless nationality, and generally Anglicized arrangements. However, there are one or two points of difference between English and Continental life, lying somewhat deeper than the obvious diversities of habits, furniture, and the like, which even in the most desultory journeying come out distinctly enough to impress themselves on the mind and afford some matter for reflection.

Perhaps the most conspicuous of these is the superabundance of leisure, as it seems if judged by the standard of English working life, which meets one at every turn, and manifests itself in innumerable ways great and small. In most parts beyond our four seas time has not yet become such a precious commodity as it is with us. In England the only time that costs nothing is past time, when astronomers, geologists, or students of pre-historic humanity take a few odd thousands or millions of years of it to construct their world in; and even that is occasionally grudgingly given. One is hardly out of England, and the conditions are changed; both present and future time seem at once to have become more plentiful. It is the difference between having to buy water by the jar and taking it freely out of a running stream; and the consciousness, not always prominent but never wholly absent, of being in a land where people are not in a hurry is perhaps no small part of the charm of Continental travel. The fact scarcely needs illustration; it is one of those notorious truths of which the most familiar instances are the best. Do we travel by railway? Except at great centres of traffic, there is nothing like the bustling stir of an English station. We are expected to be (according to our notions) absurdly beforehand with our tickets and luggage. We may have a little friendly conversation with two or three officials on the value of outlandish coins (say the proper equivalent of an Austrian guilder in North German groschen) or other incidental matters. The train waits till it is all done, as a friend going to walk with us might wait for us to fetch our gloves and umbrella; and at last we move off placidly, after repeated warnings which cannot have failed to reach the latest or dullest straggler, with a delicious sense of completeness and contentment, and a splendid disregard of earthly measures of time. Perhaps a South German express train is the most placid and soothing of human institutions. There is something innocent and idyllic in its constant unpunctuality, which becomes awkward only when you foolishly tempt the Fates by expecting to correspond according to the tables with a comparatively punctual North German conveyance. Even South Germany is surpassed in one point by the manner in which a train is started from some small Swiss stations. The exercise is performed in four motions. First one man blows a whistle; then another cries "Fertig!" then the engine whistles; then another blows a horn, and then the train moves. We believe that a bell is sometimes added after the horn, but we do not vouch for this in general.

Again, do we take up a newspaper—especially a German newspaper? The first thing that strikes us is that it is not written for readers who are in any hurry to learn the latest news. The telegraphic despatches have not any well-marked place assigned to them, and are not distinguished by any spacious print or conspicuous

headings. On the other hand, it is clear that very deliberate reading is expected. The letters of correspondents are far more discursive and meditative than would in general be acceptable in our own daily press; and moreover one finds elaborate essays and discussions on special subjects which in England would be considered out of place except in an artistic or scientific journal. Side by side with a political letter from Carthage there may be an equally long essay on the genius of Schumann, revelling in metaphysical word-coinage and refined distinctions. And the advertisements, too, show an amplitude and serenity unknown to English journalism. The announcements of births, deaths, and marriages take a good square inch a-piece; the forms in use (except those for marriages, which are shorter) are more prolix than ours, and give room for little touches of individual sentiment and family history. But why dwell on details, when every line bears witness by its type to the patient leisure of the readers? It is all but impossible to read German print rapidly; a crucial experiment, if needed, is supplied by any bilingual French and German placard of moderate length, in which the German part is printed in the old-fashioned type. It is worth noticing that the mercantile column is usually in Roman characters. The fact that the rest of the paper is not so can be accounted for only by the spare time on the hands of the non-mercantile readers, and we presume also of the printers. A public notice posted on a wall in small German handwriting (of which examples are to be found) is the extreme case of this genus.

It is the same with endless other little incidents of daily life. A South German attendant will let the traveller wait an indefinite time for his food, his bill, or what not; and will produce the thing sought, when he does produce it, in perfect order and with perfect good-nature. His delay is the fruit of no ill-will, or even negligence; it is simply inconceivable to him that a quarter of an hour more or less should make any difference. A like conclusion is forced upon us if we compare the talk of our different fellow-travellers as it falls upon our ears. When they are not English it is continuous and expansive beyond what we are accustomed to. A party of German tourists will overflow in rounded and voluble sentences where Englishmen would confine themselves to a half-articulated phrase and a nod. They have no need to measure their words or converse in the kind of verbal shorthand which we so readily fall into; they can afford the luxury of having their talk out—which, though it is our habit in England to consider it a luxury, is indeed no such thing to them—and they enjoy it to the full extent. Other illustrations may be found in still smaller matters. It is perhaps not too fanciful to hold that the continued prevalence of inferior lucifer-matches, notwithstanding the invention of wax vestas and other improvements, argues an abundance of patience and leisure in the consumer, who contentedly ekes out the defects of his sulphur-tipped wooden shaving with cunning of hollowed lands, or evades the necessity by communication of sociable fire from his neighbour's cigar. There is indeed something friendly and human in this last custom of giving and taking fire, and we should be loth to see it fall into disuse. But these little traits are such as every traveller must observe and judge for himself.

We are apt to look upon this state of things with a certain self-complacent superiority, thinking in our hearts that a world in which there is plenty of time may be a very agreeable place for an English tourist to take his holiday in, but can have nothing to say for itself on a serious comparison of advantages. We assume that the people to whom time is most precious are doing the best for themselves; "to make the most of one's time" is a common form of speech in the praise of industry, and we look on leisure with an almost suspicious eye as next of kin to idleness. And yet, by a natural counterpoise of sentiment, we show at least as openly and without reserve as any other nation, both by word and deed, our belief that some persons have a right to be idle at all times, and that there are some times at which all or most persons have a right to be idle. It seems to us doubtful whether this professed opinion is so wholly reasonable, or the sentiment and practice which qualify it so unreasonable, as they may appear at first sight. By this we do not mean to raise the aesthetic question whether it can ever be really worth while to pay the price of having no leisure for the advantages supposed to be gained; a question to which it is about as easy to find a definite or generally true answer as if it were asked whether a loaf is better than a tune. Apart from such questions, the abundance of leisure among a people is the token of certain positive advantages, and the want of it indicates at least a possibility of danger. This is apparent as soon as we try to realize what is meant by leisure.

We do not understand by leisure the interval of rest which is indispensable to keep us fit to do our work, but a time over and above this with which we can do as we please. Nobody counts the necessary hours of meals, sleep, or even exercise, as spare time. Economists say that a certain margin of waste in ordinary household consumption is not to be condemned, inasmuch as it secures a reserve to fall back upon in emergencies. That which goes to waste and is not missed in time of plenty can be utilized in time of want. May not something of the same kind be true of the consumption of time? The man who has time to spare has a reserve of force unknown to his busier neighbour to whom every moment brings its appointed task. More than this, if he uses his leisure with even moderate intelligence, he cannot fail to accumulate almost unconsciously stores of knowledge and observation lying somewhat outside the scope of his regular occupation, by possessing which he is the better fitted to adapt himself to unforeseen circumstances. His advantage is like that of a

trader who lays by something every year over one who lives from hand to mouth. Both may prosper in the end, but there is no doubt which must be considered the safer against the uncertain future. If two individuals or two nations are otherwise tolerably equal in ability and industry, the balance of probabilities in favour of continued success will be on that side on which the greater amount of leisure is found. This consideration may lead us to be somewhat cautious in giving ear to any general and unqualified declamations against the existence of idle classes in the community. It may indeed be worth reflecting on whether that more even diffusion of spare time among all sorts of people which we observe in foreign parts does not conduce more to the general happiness than our own extreme carrying out of the principle of the division of labour, by which some have more work than they can do in their time, and others have more time than they know what to do with. Probably it would be best if no class were too much occupied; but certainly it is better that some classes should be too much and others too little occupied than that all should be over-occupied. If the well-wishers of humanity who would fain abolish our so-called idle classes could have their wishes granted, they would soon be astonished to find how much excellent activity of diverse kinds—literary, scientific, administrative, and political—had been suppressed by their improvements. The leisure of well-to-do Englishmen bears fruit in an immense quantity of work which they are in no way bound to do, and which, but for their voluntary exertions, would to a great extent have to be provided for at the public expense. It may be that in some departments the result is less satisfactory than if the work were compelled and paid for; but in most cases it is probably quite as good, and in not a few considerably better. Whatever may be thought of the many vexed questions arising out of unpaid magistracy and local government, there is no doubt that art, scholarship, and science owe much to the labour of love performed by men who have been free to devote themselves to favourite pursuits without troubling themselves about the market value of their productions. In the case of literature there exists indeed a demand large and constant enough to secure by purely commercial means a supply ample in quantity; but if literature were entirely in the hands of writers supporting themselves by it as a profession, we venture to think that there would be some danger of hasty writing, of which there is already too much, becoming the only kind of writing. The presence among us of distinguished authors who write as amateurs—using the word to signify, not that they are unskilled in their craft, but that their object in writing is not to gain their living—is useful, if not indispensable, in preserving a standard of accuracy and elegance. Not only in this, but in almost every walk of life, there are very strong temptations to do something below one's best work for the sake of immediate gain; and it is well that happy accidents should place clearly above them a certain number of persons who can make a worthy use of their opportunities, even if it be at the cost of much waste and idleness on the part of others on whom such opportunities are thrown away. And even in these last we have, to recur to our former phrase, a certain reserve of force which is not to be despised in estimating our national resources, although no exact account can be taken of it. All this human energy that overflows in tours round the world, in athletics, in field sports, in the diversions of society, will in one way and another reinforce our ordinary working powers in time of need.

Let us by all means wish the day to be hastened when every Englishman may have spare time in which to make himself a more perfect man and increase his possibilities of being useful; and let us not fail to profit by any lessons which our neighbours can teach us in this respect. In the meantime let us be thankful that we are not all living from hand to mouth and engrossed by the day's care, and remember that the true use of haste is to win leisure.

SIR EDWIN LANDSEER.

A GREAT artist has died in a ripe age, full of honours. Whatever differences of opinion may have arisen, especially as to the later manner of Sir Edwin Landseer, it remains beyond controversy that no artist in our time has attained to a more widespread popularity. For well nigh half a century the works of the chief of our animal painters have been a leading attraction in the Academy, and there is scarcely a house, however humble, in the land that does not cherish some engraving of a dog, a horse, or a stag, which, through the magic of the painter's pencil has become almost as well known as the foremost men of the day. It has long indeed been said, not without some intention of censure, that Landseer's animals share the intelligence and emotions of humanity, that they think and almost speak, that they are beings endowed with fine sensibilities, and capable of becoming the companions of man. This insight into the inner life and consciousness of the brute creation was, we take it, one secret of the unsurpassed power of appeal in the painter's pictures. It has been happily said that Landseer was "the Shakespeare of the world of dogs."

The incidents in the painter's life are few. Sir Edwin was of a family of artists; his father was in 1807 elected Associate Engraver in the Royal Academy, his eldest brother Thomas is also Associate Engraver, and his brother Charles became an Academician as long ago as 1845. Edwin, the youngest son, was born in 1802, and, with the precocity which usually belongs to art,

drew animals when five years of age. He owed his first training to his father, and we find that in his thirteenth year he was already an exhibitor in the Academy. A year later he entered as student in the Academy; subsequently we find him under the guidance of B. R. Haydon, at the time when the apostle of high art was intent on anatomical dissections and wild in enthusiasm for the Elgin Marbles. In 1818 the young artist excited great attention by the exhibition of "Fighting Dogs Getting Wind," and Sir David Wilkie, writing to Haydon, remarks that "Young Landseer's jackasses are good." In 1822 the British Institution awarded a premium of 150*l.* to a further success, "The Larder Invaded." Landseer's career became each year more assured. As early as was possible under the rules of the Academy—that is, immediately on attaining the age of four-and-twenty—he was elected an Associate; a distinction shared only by Sir Thomas Lawrence and Mr. Millais. In 1831 he became full Academician, and in 1850 received the honour of knighthood. On the death of Sir Charles Eastlake he was offered the Presidency of the Royal Academy, a position which for more reasons than one he declined. His industry is not less remarkable than his talents; from the year 1815 down to the present time his name is absent only seven times from the Academy. As lately as 1870 he exhibited five pictures; his more recent contributions were not only avowedly unfinished, but gave signs of waning power and painful malady.

The genius of Sir Edwin Landseer lay sufficiently on the surface to be easily understood. Few men have had a more happy faculty of seizing on a subject in its simplicity, its breadth, and its dramatic action. Few artists have told upon canvas stories so perspicuous, pleasing, or persuasive. Whoso ran could always read; indeed the compositions which charmed the multitude had sometimes the fault of being too obvious; they were adjusted as by a trick and executed with *legerdemain*. Landseer was sufficiently a man of the world to know the public by which he lived, and, like his fellow-Academicians generally, he did not care to expend more thought or labour than the exigencies of the moment demanded. His success, indeed, within the sphere of his art greatly depended on his *savoir-faire*. We have never known a painter who could tell so well what to do with his subject; he distributed his materials almost with the certainty of geometric law; concentration and subordination were with him such paramount considerations that to be scattered in composition became an impossibility. In the choice of his subjects he was most felicitous, and though we have never happened to hear that, in common with some of his brethren, he united literary with artistic talent, yet the thoughts he has embodied, and even the titles he has hit upon, imply that ready invention, that facile and neat power of expression, that play of fancy and of wit which in the world of letters go to the making of a successful story. The names given often in themselves carry the imagination to the before and the after, so that the composition suggests as it were an introduction and a conclusion stretching beyond the narrow limits of the canvas. As instances of happily suggestive titles may be named "A Distinguished Member of the Humane Society," "There's Life in the Old Dog yet," "Laying Down the Law," "Alexander and Diogenes," "Dignity and Impudence," "The Highland Shepherd's Chief Mourner," &c. The National Gallery and the South Kensington Museum happily are in the possession of master works which alone are sufficient tribute to the artist's memory. In the latter may be seen one of the many incidents which never failed to seize on public sympathy. Opposed to the horrors of "War" are the pastoral pleasures of "Peace." Useless guns lie on the green sward, and a little lamb gathers its meal from the herbage which has grown around the cannon's mouth. Such ideas are essentially poetical.

But the brightest picture is not without shadow, nor the most illustrious career without its reverse side. Certain it is that of late years Sir Edwin Landseer has suffered disparagement, not perhaps from the general public, who are mostly content to worship great names even to the last, so much as from the younger generation of painters, who may imagine that they have found for themselves a more excellent way. It must be confessed that Sir Edwin Landseer was somewhat spoilt by success, and as age advanced he fell into the almost inevitable habit of repenting, with variations, certain favourite themes; and yet we can scarcely recall a picture which has not some charm peculiarly its own. Perhaps the artist himself, as often happens, became his own most formidable competitor, inasmuch as sometimes the worst that could be urged against a picture was that the painter had done better. But now, when life's fitful fever has ebbed away, history will judge of the illustrious dead by those works only which the world would not willingly let die.

Sir Edwin Landseer, in common with other artists who have left a mark upon the century in which they lived, is distinguished scarcely less by his handling than by his conceptions. His first manner as usual is careful, his last careless; when at his prime few men have shown greater mastery over the brush and the pallet, not to say the pallet-knife. He had a supremely dexterous way of laying on pigments almost in solid relief, and then when half dry, he would glaze transparent colours over the rough surface, and finally rub or scratch out high lights with a rag or a knife. As a shrewd artist he never scrupled to use whatever expedient might best suit his immediate purpose; indeed the secret of his art seemed to be the knowing what to do and the power of doing it. It must be conceded, however, that this matchless power he sometimes used recklessly. It is true that a painter proves mastery when rapid and random strokes of the brush fall into form on being

viewed from the right distance; still, if an artist tosses off his works under pressure of time, and with impatience of study, his reputation must suffer. It cannot be denied that some of the most successful of Landseer's compositions illustrate what in trade is known as "economy of manufacture;" the animals have exquisite texture in hair or wool, but are inarticulate in form; the modelling has a broad generalization which is defiant of detail. But this clever manipulator was wise in his generation; he knew that at any rate in the hands of the engraver the defects would be disguised. Landseer, it has been often objected, was no colourist; his pigments were of the earth earthy; and yet, though chalky, they are seldom unpleasant. His picture in the end seldom failed to come right; and the colour, chiaroscuro, and composition were ultimately in fair agreement.

Sir Edwin Landseer, when he passed from painting to sculpture, may be supposed to have given proof of the universality of genius peculiar to the old masters. He had indeed special qualifications for the modelling of the lions which are now at the base of the Nelson Column. While yet in his teens he assisted, under the direction of B. R. Haydon, in the dissection of a lion, and the studies which he then and subsequently made enabled him throughout life to treat the noble beast with unusual knowledge. Landseer certainly had the advantage over Thorwaldsen, who, when modelling in the clay the lion now at Lucerne, had never seen a live lion. And yet the lions in Trafalgar Square are manifestly the work, not of a sculptor, but of a painter. They are deficient in sharpness and detail, and the touch is rather that of the brush than of the chisel. Nevertheless this plastic art, like the painter's pictorial art, is finely conceived, the creatures are well posed, they have calmness and dignity.

It may be rather early to speak of the position which Sir Edwin Landseer will ultimately occupy in the history of art. He will have to hold his own, not only in competition with Paul Potter, but in rivalry with contemporaries such as M. Troyon and Mlle. Rosa Bonheur in France, and M. Joseph Stevens in Belgium. We should incline to place M. Troyon as the first of animal painters in the nineteenth century; to name the second may not be so easy, but when the "Horse Fair" was seen in London certain critics at once assigned to Mlle. Rosa Bonheur a position above any of our native artists. If we may venture to anticipate the calmer judgment of posterity, we should say that the great painter whose loss we cannot too deeply deplore will, in comparison with his predecessors and contemporaries, be found wanting in a stern view and strong transcript of nature. Like Murillo, the most popular of painters with the multitude, he sometimes falls into sentimentality, and his latest style degenerates into the lachrymose and the vaporous. On the other hand, it must be conceded that no other painter has endowed animals with equal refinement and sensibility; and the dogs of Landseer are not merely domesticated, they are civilized and humanized.

THE PANEGYRISTS.

LORD MACAULAY, in one of his Essays, says of some moral reflections of Lord Stanhope's, the truth of which he does not doubt, that they may probably have been new in the court of Chedorlaomer. The political experience of Chedorlaomer can hardly have been large, but one would think that, even in his days, men may have begun to find out that the truth is not always told to princes, especially about matters in which princes themselves are concerned. Perhaps indeed it would not be going too far to say that the sin of flattering princes can hardly fail to be as old as the existence of princes at all. But there are some times and places in which the art of flattery, whether of princes or of others from whom there was anything to be gained by flattering, has been more thoroughly reduced to a system than at other times, and has been practised in a more open and formal way. Perhaps few people think how much of what once was gross flattery lurks in many of the commonest formulas and courtesies of everyday life. Forms which could have sprung only from the most cringing baseness in those who first used them gradually came to be used as matters of course, without any thought of their meaning, and at last dried up into the merest survivals. A man puts "Sir" at the beginning of a letter, and signs himself "your obedient servant" at the end, without a thought that in the literal sense the beginning of the letter binds him to vassalage, and the end of it to something lower than vassalage. Nowadays each rank has its stereotyped description; its substantive—Majesty, Grace, or Lordship; its adjective—Gracious, Noble, Honourable, or Reverend. All these are now fixed, and they therefore mean nothing; but they are all traces of times when men vied with one another in crowning a powerful man with the stateliest substantives and the most flattering adjectives that they could think of. Nay, when the old Quakers took up their parable against the use of the second person plural to express a single person, they had more to say for themselves than may seem to us nowadays. We now habitually say "you are" for "thou art"; the thing is done thoroughly as a matter of course, without any thought whether the person spoken to be higher or lower in rank than the speaker. It amounts in fact to a grammatical change in the language. For all purposes of ordinary speech, for all purposes but those of prayer and poetry, "you are" has become the second person singular of "I am." But as long as people said "you are" to one class of people and "thou art" to another, the Quaker had a perfectly good case according to his own

principles. The way of speaking against which he protested was one which had really begun as a piece of flattery. To speak to a single man as if he were greater than one man, as if he were two or more, really came into use as a flattering form of speech. It is a fashion of which there is no trace among the free-spoken republicans of old Greece. No such sacrifices of grammar to adulation were known when the meanest Athenian could not call Pericles anything but Pericles, or Agariste anything but Agariste. It was equally unknown in the republican days of Rome, and in those earlier days of the Empire when men did not yet openly confess that the Republic had come to an end. The use of the *pluralis excellentie* comes in about the same time as the use of the diadem and the other badges of Eastern sovereignty which proclaimed openly that Rome had ceased to be a Commonwealth. The respectful periphrasis is as old as Homer. The fashion of calling the man to whom one speaks one's Lord, and oneself his servant or his dog, seems to be immemorial in the East. But it was in the days of the later Emperors that the fashion first began in Europe of speaking of one man as if he were two.

This brings us at once round to the class of writers whom we have immediately before our eyes, the Panegyrists of the fourth century. They form a class by themselves; they show the art of flattery in its most perfect and systematic form. The practice did not begin with them; poets had flattered as soon as there was anything to flatter, and flattered perhaps more grossly than any prose panegyrist. We do not think that any of the orators of the fourth century pray Constantine to take care in what part of the heavens he seats himself, lest, if he does not hit the exact middle, his weight should send the universe awry. Pliny too addressed a prose panegyric to Trajan, but between Pliny and Trajan there were still some traces of decency. There were differences too in the form of the thing. The Consul of the moment makes a speech in the Senate, and, though his speech is in praise of the Emperor, though he presently turns round and addresses the Emperor in the second person, yet he begins, as Cato the Censor might have done, by addressing the Conscript Fathers. Also of the writings of the age of Trajan, of the writings of the younger Pliny himself, the Panegyric forms but a small part. But in the times of which we speak the Panegyrics really form a large part of the Latin literature of the age, and they are the work of professional rhetoricians who seem to have had nothing to do except to tell the reigning Emperors how far they surpassed everybody who had gone before them. The thing is of a piece with all the innovations of the age of Diocletian. It is the putting forth in its full and naked shape of something which had hitherto been perhaps only half grown, and which certainly was half hidden. We are thinking mainly of the Latin panegyrists, though we must not forget that there were panegyrists in Greek, Eusebius the Bishop, and Julian the Cæsar, who at any rate did something beside make panegyrics. But the Greek tongue had for ages been used for mere rhetorical display; and it was rather in this age that, alike among the Christian writers and the enemies of Christianity, a more solid Greek literature began again to arise. But in the West the voice of the great lawyers had not died out so very long when the earliest Panegyrists began; and Ammianus, as vigorous and independent in his thoughts as he is detestable in his style, is the contemporary of the later Panegyrists. As for their style, we never know exactly what the word "classical" means, or where and why the "classical" period is supposed to end. But at any rate, though it has changed a good deal from that of the days of Augustus, or even of the days of Trajan, the style of the Panegyrists is by no means so queer and hard to make out as the style of Cassiodorus or even of Ammianus himself. We are, however, more concerned with their matter than with their style. It is well known that for a large part of the history of those times, especially for the earlier, the Western, reign of Constantine, we are driven to make use of the Panegyrists as one of our chief sources. Now what is the value of such writers as these as historical authorities? How far can we believe men who are haranguing a prince in praise of himself? Such a form of composition has its peculiar temptations to falsehood, but they are not quite the same temptations as those which belong to some other forms of composition which are at least as little to be trusted. For instance, the panegyrist who, as a rhetorical exercise, extols the prince to his face, is not in exactly the same position as the prince himself, when he puts forth documents of various kinds for the information or the deception either of his own subjects or of other princes. Both will probably lie, but they will not lie in exactly the same way. The panegyrist at all events in addressing princes, some of whom were certainly very far from fools, is not likely to venture upon much in the way of mere invention. He will leave out a great deal, he will colour a great deal, he will exaggerate a great deal, he will pervert his own moral sense to praise a great deal which ought to be blamed, but the main facts which he asserts are pretty sure to have happened much as he states them. A panegyrist may talk of an insignificant skirmish as if it had been a wonderful battle; but he will hardly venture to tell a prince to his face that he won a victory where he really suffered a defeat; because so to do would be no longer panegyric but satire. It is indeed just possible that some very foolish prince might like to be consoled for want of success by mere lying of this kind. But it would not have gone down with men at all on the level of the elder Constantine, of Constantine, Theodosius, or even the Herculean Maximian. We must be on our guard for the things which they are likely to leave out; we must look out for any involuntary admissions of the dark side of the picture. But for the main facts of the

history they are good positive authorities, though to prove a negative they are worth nothing at all.

In one case indeed the Panegyrist is fully worthy of belief; that is, when they glorify their patrons for acts which only a flatterer would speak of as other than crimes. There is a most remarkable instance of this in the way in which the Panegyrist of Constantine with one voice pick out to celebrate, as one of his most glorious actions, the frightful cruelty of exposing captive Frankish kings, and, according to their account, thousands of their subjects, to the wild beasts in the amphitheatre of Trier. Now the emphatic way in which this is dwelt upon by one flatterer after another, and the inflated language in which the glory of the act is magnified, seem to point to one or two conclusions which are worth thinking of. It would certainly seem to imply that the act went, in some way or another, beyond the ordinary measure even of Roman cruelty. Eumenius indeed distinctly speaks of Constantine as having revived the ancient practice of putting conquered enemies to death:—

Renovasti, Imperator, veterum illam Romani imperii fiduciam, quæ de captis hostium ducibus vindictam morte sumebat.

The triumphs of Pompeius and Aurelian were certainly bloodless, and Cæsar himself did not throw Vercingetorix to the lions. The treatment of Jewish captives under Titus stands on a somewhat different ground; they were not enemies, but rebels. And again the inflated language used on this subject, and the number of times that it is spoken of, would almost seem to show either that Constantine's own conscience was uneasy about the matter, or else that murmurings had been heard in some quarter or other. The language of the Panegyrist has in it something of the nature of bravado, something of that strut and swagger which men put on when they are defending some favourite practice about which they do not feel quite easy in their own minds. At all events, one hardly ever read anything more horrible than the following words of one of the anonymous orators:—

Quid hoc triumpho pulchrum? quo cadibus hostium utitur etiam ad nostrum omnium voluptatem, et pompam munerum de reliquiis barbarie cladis exaggerat. Tantum captivorum multitudinem bestis obijcit, ut ingrati et perfidi non minus doloris ex ludibrio sui, quam ex ipsa morte patientur.

Another point to be mentioned is, that in the orations addressed to Constantine, and even to Theodosius and Gratian, there is not a word of Christianity. In the case of Constantine we are not surprised at this; the panegyrics are spoken at Trier, not at Byzantium. But Latinus Placitus, in addressing two of the most orthodox of princes, has not a word to say about the faith for which they were so zealous; he shows as little consciousness as Claudian himself of the great change which had come over the world. On the other hand, besides a few trifling mythological allusions, there is nothing distinctly pagan. The key to this singular state of mind, or at least of speech, one so characteristic of that strange time, is doubtless to be found in the place where this panegyric was spoken. It was spoken in the Old Rome; it was spoken to a Christian Emperor in his still pagan capital; it was only by speaking in this colourless kind of way that the orator could avoid giving offence either to the prince or to the great mass of his other hearers. Eumenius, on the other hand, uses a different kind of language, a kind of language which we may suppose would exactly suit the state of Constantine's own mind at that stage of his life, and which we may quote as an example of that influence on paganism itself which was not the least among the effects of Christianity. Eumenius talks about the Immortal Gods, but this would seem to be only in a conventional kind of way; where he really speaks his own mind or adapts himself to the mind of his Imperial hearer, he speaks of "Deus" in the singular in a style unmistakably monotheistic, though in no way distinctively Christian. This probably would fairly express the state of Constantine's own mind, when he was still wavering between, if not actually combining, solar worship and Christianity. On the other hand, in a somewhat earlier anonymous panegyric addressed to Maximian and Constantine, we have the Gods spoken of in a way which reminds us of Elijah and the prophets of Baal. Misfortunes happen to men not by the will of the Gods, but while the Gods are looking after something else. It is really a case of "when the cat is away the mice will play," only unluckily the Panegyrist does not explain his creed so fully as to let us know what kind of Ahirman plays the part of the mice. The passage runs thus:—

Aliquid enim Dii ipsi, quod plerumque humanas res negligant, dum querunt, igneant, quibus aliud fortasse curantibus grandines ruant, terre desiccat, arides hauriuntur, quæ non illis hauriuntur volentibus, sed aut aliorum aspicientibus, aut fatali rerum cursu urgente videntur accidere.

DUAL GOVERNMENT IN THE BRITISH ARMY.

WE recently brought to notice the startling fact that the division of authority in the French army which, although a mere source of irritation in time of peace, proved fatal to its efficiency when tested by war, was no accident or modern invention, but the growth of the practice of centuries. It dated, as the Duke Pasquier's Report has proved beyond dispute, from those evil days of the dead *ancien régime* when a practically despotic Minister and a theoretically despotic Monarch had their separate representatives at each army's headquarters; the former in the Intendant, the creature of the central administration, the latter in the commander, whom the Intendant was placed near, nominally to

assist, but in reality to check. Considering the singular relations of Louis XIV. and Louis XV. to the able but unscrupulous Ministers through whom they governed—the entire dependence of offices of the latter, according to the theory of absolute government, on the will of their sovereign, with the very real power which they framed for themselves out of their mastery of his business—it is not so surprising as it at first sight seems that this singular plan of double government should have become a permanent part of the system of the French army, where the Revolution found it engrafted firmly, and used it naturally enough in order that the Committee of Public Safety might domineer over the generals whom it sent forth to conquest or the guillotine. What the Revolution strengthened Napoleon spared, because his personal mastery of details was so great and his power so unchecked as to make him careless as to the forms he used, sure that his will would pervade them all. Thus the dual government came down with all the prescription of past authority in its favour until the Second Empire arose. Here there was but little prospect that it would be interfered with. Louis Napoleon's chief army reforms, such as they were, were all directed to restoring the form, if he could not restore the spirit, of the Grand Army that had triumphed under his uncle; and when the Italian successes were over which placed him at the zenith of his power and made him for the time seem to be the dictator of Europe, it was little likely that so mediocre a genius as his would discern beneath this apparently brilliant display of military strength the rottenness of the system on which he relied. The new Report of the French Committee logically shows that the so-called Legend of 1793—the effects of which on Gambetta's heated brain the first Report fully exposed—was not more fatal to the efforts of the Government of Defence than the false prestige of Solferino to that of the Empire. It is plainly proved that it was not till Marshal Le Boeuf found himself at Strasburg, holding vain councils of war to supply the needs too late admitted, that he discovered that the improvidence and delays which the slow policy and defective military system of Austria had permitted to succeed eleven years before were about to ruin himself and his master when brought face to face with the well-prepared organization devised and carried out by Roon and Moltke. Up to that fatal hour when the challenge was flung down, the Solferino tradition effectually blinded the eyes of French administrators, though there were not wanting some keen critics besides Trochu and Stoffel who knew on what illusions it was based.

What Frenchmen did not discover about themselves Englishmen could hardly be expected to know; and hence, if we have blundered extravagantly in imitating that Intendance system which is now so distasteful in France, there is good excuse for the mistake of our organizers. What is not so easily excusable is the want of courage which attempted to evade the real difficulties of organization with ourselves by introducing a servile imitation of a model which now proves to be a deception. For no one who knows its history but is aware that our Control Department is but the French Intendance imported into our army. We are not here about to criticize it in detail. Our object is to look at the subject more broadly, and to show that in its introduction the measure most unfortunately provided for carrying out piecemeal that halting system of divided government and responsibility which the good sense of the nation had resolved to reject at headquarters and in the grass.

Our dual military system, mistakenly spoken of as extinct, in one sense is modern, though in another sense it is very old. It existed in the rude form of Parliamentary inquiry and supervision over Royal mismanagement long before Lord Palmerston's strong character cleared the way for the civilian War Ministers who have followed him. It was not possible that the jobbery which confided the Netherlands army of 1793 to a scapegrace Royal Duke whose boyish follies, when he first assumed his functions of command, had driven his best friends almost to despair, which gave the Walcheren army and its mighty project to a raw courtier general, and which neglected Wellesley's genius till politics brought him into place; could have been always tolerated by the House of Commons. There was a constant irregular control in fact exercised by Parliament over the service in which the Crown was in theory supreme; but the century had well advanced before there grew out of Lord Palmerston's magnifying of his office of Secretary-at-War, and its enlargement in the haste of national indignation over the Crimean breakdown, that curious system of an admitted division of responsibility between the civilian Minister and the military Commander-in-Chief under which and its inherent evils we lately groaned. At no point were their respective powers or functions fairly defined. Every paper that was submitted served to give an opening for recrimination and rejoinder. The two governors of the army wrote long letters at and to each other, as though each were the dissident member of some joint Committee which he never attended. The War Office grasped the purse-strings, and made its financial control visible at every point. The Horse Guards took up the position of advocate and defender of the soldiers' rights against civilian oppression. And such a chaos finally arose as it is probable no great department has ever suffered from in time of peace, and as would inevitably have brought serious disaster in the event of war.

Out of this vicious state of things it was Mr. Cardwell's task to bring the army. Unfortunately he found himself face to face with a prescriptive power in the Horse Guards which he had not the courage to force his way through. From the night when his project of army reform was announced, and the listening galleries

heard that the head of the Horse Guards, the General Commanding-in-Chief (known popularly as the Commander-in-Chief, a title abandoned as unconstitutional since Wellington resigned it), was to be practically irremovable, and an unpopular Military Secretary sacrificed in his stead, it was certain that dualism was not slain. Feeling himself apparently unable to do away with it absolutely within his own Office, where the change in this direction—as will presently appear—has been more nominal than real, the Minister caught at the notion of carrying out his own authority in detail through the Control Department, a too faithful copy of the Intendance which Louvois established in his day for not very dissimilar reasons. We need not enter here into the discussion which has arisen on its merits or demerits, for they are beside our main question. What we are concerned to show is proved for us at a word by the ablest of the disputants who lately addressed the *Times*, when he said in his defence of the Control, with truth, that the jealousy against it arose from the simple fact that it was “the special representative of the Minister of War,” and was viewed as such. In innocently uttering this, he was not apparently aware, nor were his opponents, that it was impossible to go further in condemnation of the system which has given birth to such a creation. For the Minister who does not govern the army through those placed immediately over it, either because mistrusting them as a body or deeming it hopeless to attempt to choose the right officers for high authority, and who seeks instead of this to govern the generals by side-strings as it were, through a set of officials placed near them “to represent himself,” is lending his weight to a system inherently so vicious that it only needs to be tested to break down in practice. Happily amid the exigencies of war the co-ordinate authority thus raised up may disappear, and “the system,” with its false show of check, be dropped for the time. Still this does not excuse those who maintain what is of necessity in its principle either unworkable or else dangerous at every strain. An army so administered would in fact be under two heads. Those who devise or defend such a thing do not understand what it would mean when prompt action is needed. And yet Napoleon’s maxim is founded on no secret philosophy, but on a patent moral truth, such as he who runs may read. It is as easy to understand as it is good for all time:—“Better by far in the field one ordinary commander than two men, be they ever so good, who divide the command.”

As we before indicated, this local dualism set up at every petty headquarters, fruitful of wrangling in time of peace, certain to be fatal or else to disappear—as under a strong general well backed like Sir Garnet Wolseley, for instance, it will at once—when the army goes to its work of war, has been evidently endeared to the War Office by the supposed impossibility of the Minister’s ruling through the generals themselves. For it is not to be lightly believed that Mr. Cardwell really mistrusts these officers as his representatives. It is rather that he not only has little to do with their selection, but finds himself unable to get directly at them. There is, in fact, a screen constantly intervening between him and them which he has not been able to remove. Though Minutes have taken the place of letters between the civil and military branches of the War Office, and personal conference of references, the dualism which we hoped had been dead flourishes still. Of late indeed the antagonism of the still co-ordinate power has been apparent at every turn. Mr. Cardwell abolishes the foolish and antiquated distinction between the adjutant-general and quartermaster-general’s branches by official circular; “the Horse Guards” prefers to maintain it, and the two departments still exist side by side. Mr. Cardwell openly desires to have one Chief of Staff, as in all other armies; “the Horse Guards” objects, on the ground that its head is his own Chief of Staff, and this objection is allowed to outweigh the theory and practice which alike condemn it. Mr. Cardwell would establish a genuine working Intelligence Department; “the Horse Guards” only admit it under conditions which make its practical usefulness impossible, and so add but a few more well-paid functionaries to an already overpaid and overcrowded headquarter staff. In all these and many minor differences, it is but right to say, though the matter seems a personal one, the civil administration appears as the reforming element, the military as opposed to wholesome change. Indeed the War Office is found proposing improvements in discipline, improvements in education, even improvements in drill, only to find that its efforts are at every turn thwarted because interfering with prescription or with the patronage for which “the Horse Guards” seems to think that Great Britain maintains her army.

We have told our story; we will add but a brief parallel. Our own example of the division of authority between the Minister and the General Commanding-in-Chief was recently imitated by a great nation dashing hastily into military reform under the sting of sudden and disastrous defeat. It was felt to be necessary in Austria, after her misfortunes in 1866, to take the charge of the army out of the hands of the Imperial Camera which, under the Emperor’s name, had used it for personal and family jobbery, made hateful to the nation by the collapse at Sadowa; but it was naturally enough attempted to soften the abrupt transfer of power from the hands of Francis Joseph by creating the same office which our Horse Guards here represents, and putting at the head of it the one member of the Imperial family of whom all could be sure that he would do nothing to disgrace the House of Hapsburg and the fair fame of Austria. The Archduke Albert had every claim which could make his division of authority with the new Minister for War grateful to the nation and the army.

Popular himself, he came of an illustrious stock; for his father, the great Archduke, had triumphed over every enemy he met save Napoleon himself, and had retired with honour from his contest with the conqueror of Europe. He was himself a successful General-in-Chief, and fresh from the great victory of Custoza. He showed himself, in his world-famous pamphlet on Responsibility in War, thorough master of the highest philosophy of his profession. Yet the experiment proved an admitted failure, and that for one simple reason; no one was ever able to define the exact limits of the respective powers and duties of the General-in-Chief and the Minister for War; so, after two years’ deliberate trial, it was abandoned for ever. Not that Austria has got rid of her best soldier, or ceased to utilize his powers for the good of the service which honours him, as it is honoured by his presidency over it. What has been done is simply this. The Archduke Albert has ceased to be General-in-Chief, or to have any connexion with the indoor economy of the War Office. He retains, however, all those parts of his former functions which relate to visitation, inspection, and report, under his new title of Inspector-General of the Austrian Army; and thus he fills a position in which usefulness and dignity are happily combined with freedom from all complication with the administration of the forces, over whom he still presides and watches, though no one but the responsible Minister commands them. To such plain teaching as this example offers it would be superfluous to add a moral.

AN AMERICAN CHESTERFIELD.

AN American schoolmaster, who has at least no lack of courage, has undertaken in a concise manual to teach his countrymen good manners. This is known to be a somewhat delicate subject on the other side of the Atlantic, and perhaps it is as well that anything that may require to be said about it should be said by a native rather than by a foreigner. Mr. Gow appears to be anxious at the outset to clear himself from the suspicion that, in suggesting the possibility of his countrymen being better behaved, he is engaged in an underhand attack on Republican institutions. In a sort of declaration of faith which he has prefixed to his work he states that “he believes religiously in the fundamental principles of our American system of government”; but perhaps he forgot at the moment the unwritten principle by which the free citizen of a great Republic is held to be naturally endowed with all the virtues and graces which it is good for anybody to possess. It is impossible to deny that Mr. Gow betrays an imperfect sympathy with the child of nature who does “as he dam please,” and a touch of Caesarism may perhaps be detected in his ostentatious preference for fastidious refinements and conventional formalities. Mr. Gow’s book, which bears the title of *Good Morals and Gentle Manners for Schools and Families*, is addressed to the rising generation, possibly because he fears that their elders would derive little profit from his admonitions. It is obvious that instruction of this kind, to be of any value, should be thorough, and this merit may be claimed for the publication before us. Mr. Gow goes to the very roots of things, and includes everything. He discusses homicide as well as table-napkins. The various degrees of homicide, from excusable homicide to murder, are enumerated, but all are deprecated as incompatible with gentle manners. “It is,” Mr. Gow observes, “not an uncommon thing for young men and boys to carry knives, pistols, slung-shots, and other death-dealing instruments,” and he points out, for the guidance of persons who wish to avoid committing murder, that it is difficult to murder anybody if you have nothing to do it with. There can be no doubt, as the writer remarks, that the happiness of the world depends to a great extent on the terms on which people live together, and the duty of restraining homicidal instincts is therefore one of the first principles of politeness. It will be seen that Mr. Gow does not fail to begin at the beginning; and in this he shows his practical sagacity, for there would obviously be little use in teaching a youth how to conduct himself nicely at table until some progress had been made in persuading him to abandon the promiscuous use of slung-shots. Mr. Gow deprecates not only murder, but profane language, which, he says, is “contrary to the law of God and the usages of good society”; so that if the first reason is not enough, he has another in reserve. Mr. Gow is enthusiastic in his advocacy of charity and good will between nations as well as between individuals, and in order to inculcate this lesson he inserts an historical narrative under the heading, of “National Apology.” “The following incident,” he says, “is worthy of notice, as it illustrates the application of the moral law in the government of nations.” And then he goes on to tell how during the American Civil War Great Britain permitted “ships to be furnished in her harbour with arms and men, to prey upon our commerce, contrary to the law of nations.” But afterwards Great Britain humbly apologized for the wrong she had done; and he inserts “the language of the national apology,” which, he adds, was accompanied by an agreement to pay for the losses sustained by American citizens. There is an impression on this side of the Atlantic that the story is not quite so simple as is here represented for the edification of American schoolboys, and there are one or two important passages which Mr. Gow has somehow forgotten. For example, the wrongs of which the Americans complained as contrary to the law of nations were things which the Americans had themselves always claimed the right to do when it suited them, and were contrary, not to the law of nations, but only to certain new rules manufactured for a special purpose, which

rules have not as yet been recognized as permanently binding by any nation in the world. These are no doubt details which did not concern the moral purpose of Mr. Gow's work; but it might have been as well if he had recollected the application of the moral law to historical veracity. Mr. Gow is very strong in his condemnation of "plagiarism or literary theft." "To use an author's works," he says, "and to derive a benefit from them without his consent, is grossly dishonest"; but this remark appears to be limited to the works of American authors. Mr. Gow does not allude to the treatment to which foreign authors are subjected by his countrymen.

Having settled the great principles of social morality, Mr. Gow descends into the familiar sphere of daily life. He has observed "a great propensity in some to cut and deface even painted and polished surfaces, such as those of chairs, tables, doors, and window frames," and he thinks it "a shame that no public building is safe from injury and abuse without the intervention of the police." Court-houses, public halls, hotels, and even churches and cemeteries are all despoiled in this way. An anecdote is related which would seem to suggest a summary mode of dealing with whittlers. A shopkeeper finding a man hacking away at his counter cut off one of the tails of his coat, which we suppose may be regarded as an application of the moral law to the protection of property. Mr. Gow thinks that a few hints on cleanliness "may not be unreasonable to those who aspire to be gentlemen and ladies." The hands, face, neck, and ears should be thoroughly washed every morning, and then dried with a towel, and it is possible that, if the hands get very dirty, they may even require to be washed twice a day. A tub of cold water is also recommended as a "simple luxury." All linen and cotton clothing should be frequently changed and washed. Spots of grease upon the clothes indicate a great lack of neatness in the wearer. Every young gentleman and lady should be provided with a handkerchief, which should be so frequently changed—here is the lurking *Cæsarism* we hinted at—as to be disagreeable neither to themselves nor to their neighbours. Mr. Gow even insists that every person should use his own hairbrush, toothbrush, toothpick, and handkerchief. Again, true politeness would suggest that people should not be perfumed with Cologne or musk, onions or tobacco, the odour of the hen-house or the barn. Some persons, it seems, have so little regard for the proprieties of the table as to clear the throat and cough and spit upon the floor before beginning to eat, but "such thoughtlessness is deserving of the severest censure." It is also very rude to spit anything out upon the plate. No one should be so unpolite as to help himself to sauce with his own spoon, or to pick his teeth with a fork. When persons have finished eating, it is very ungraceful to tip the chair back upon two legs, or place the feet upon the rungs of the chair. Nor does Mr. Gow approve of guests carrying off apples, nuts, or sweetmeats from the table, unless at the request of the host; "it might be supposed that you are not accustomed to such delicacies, and thought it necessary to lay by a supply for future use." We are further informed that politeness requires that gentlemen should not come to the table without their coats, especially if covered with perspiration. "The propriety of this rule is very obvious." Mr. Gow, however, is disposed to retaliate on the other sex for this infringement of manly freedom. "If," he says, "it be considered impolite, as it is, for a gentleman to enter ladies' society or to sit at table with his coat off, even on a very warm day, it may for similar reasons be a question whether a lady may appear in a gentleman's presence with no covering upon her neck and shoulders, and no sleeves at all." We are glad to find, however, that Mr. Gow does not think it necessary for ladies to talk of the limbs of the table or the bosom of a chicken. A young woman was hurt in a railway accident and taken to the hospital, when the doctor asked what was the matter with her. One of her limbs, she said, was injured. Well, he returned, but which limb? "Oh, I can't tell you, doctor, but it's one of my limbs." "Oh, nonsense," cried the doctor, out of all patience; "which is it—the limb you thread a needle with?" "No, sir," she answered with a sigh, "the limb I wear a garter on." Mr. Gow thinks, and we agree with him, that she might as well have said leg at once. We gather from some observations in this book that young men as well as young women in America are victims of the mania for tight-lacing. There are, we are told, a great many young men and boys who seem desirous of emulating their sisters in this absurdity. Ladies are warned that they should not appear in elaborate dress for breakfast, nor should they be so negligent as to excite remarks at the impropriety of their appearance. Mr. Gow rebukes his countrywomen for dressing extravagantly in high colours, with laces and jewels, for church, and relates an incident to show that tawdry finery and the display of jewels are not consistent with the ideas of good society in Europe. The incident was a visit of a party of Americans to Odessa, where they saw the Imperial family, and were apparently astonished to find that the Emperor "sporting no jewelry or insignia of any kind." The Empress and the little Grand Duchess wore simple suits of foulard silk, with a small blue spot on it. "Both ladies wore broad blue sashes about their waists; linen collars and clerical ties of muslin; low-crowned straw hats, trimmed with blue velvet; parasols and flesh-coloured gloves." But this is not all. "The Grand Duchess had no heels upon her shoes!" And she also wore her own hair—that is, as far as the American visitors could find out. Shoddy might answer that it is all very well for Emperors and Empresses to go about in this simple way, but that it cannot dispense with high heels, or otherwise it would be lost in the general mob.

Mr. Gow lays much stress on what he calls "the educated mouth." The educated mouth does not gape or splutter. He points out that "it is not in good taste to see persons in public places with their mouths full of gum or wax, and apparently in laborious exercise." This habit is especially objectionable in a lady. Gracefulness should be studied in all our actions. Therefore it is not advisable in company to sit astride of a chair, or to tilt it back against the wall or the furniture. Young people should not lean on each other when standing together. "A boy may with great propriety entertain himself by whistling when he is alone, but to do it in the house or in company, without a special invitation, is intolerable." If the hair is not satisfactorily arranged, people should retire to a suitable place to attend to it. "To comb the hair, or scratch the head, or pick the face or nose or ears, or clean the nails, indicates a want of proper respect for the company. Such actions are not in good taste." According to Mr. Gow's strict code of manners, "gentlemen do not spit in company, particularly upon the carpets or on the stove." "Nor should we blow the nose without using the handkerchief." In conversation it is not desirable to question the company as to what they paid for their clothes or jewelry. Slang is also condemned, and such expressions as "I'll bet," "Dry up," "You've barked up the wrong tree," "He forked over," "He made tracks," are excluded from Mr. Gow's polite vocabulary. He is also of opinion that it is going too far for a young gentleman to be so familiar with a young lady as to toy with her hands or to play with her rings, to handle her curls or to encircle her waist with his arm. In calling on friends, visitors should always enter by the front door, but never until after giving a warning by the knocker or door-bell. "The degree of intimacy which would justify the violation of this rule, and especially an entrance without the use of the knocker or bell, should be very clearly established." It must be admitted that some of Mr. Gow's instructions are painfully elementary, and do not convey a very high idea of the delicacy and refinement of the society for whose benefit he writes. It would, however, be unfair to take this book as a fair sample of the social habits of Americans generally. Mr. Gow dates from Indiana, where, it is well known, marriage is very free, and perhaps manners are as free as morals.

THE GAME-LAWS IN ENGLAND.

THE Committee of the House of Commons which sat during the last two Sessions recommended that the protection given to rabbits by the Game-laws should be withdrawn, except in warrens or other enclosed places. But they qualified this recommendation by noticing the objection to it, that annoyance would be likely to be caused to occupiers by the intrusion of strangers in pursuit of rabbits, and that those strangers would not too scrupulously abstain from taking winged game if they saw a convenient opportunity. "The question," say the Committee, "is beset with difficulties"; but these difficulties would be mitigated by the application to this question of practical good sense by those classes who are affected by it. The recommendations of the Committee ought to have great weight with game-preservers when the constitution of the Committee is considered. The Chairman was Mr. Ward Hunt, who has been, and may be again, a leading member of a Conservative Administration, and in the draft Report which he proposed occurs the passage:—

Your Committee cannot too strongly reprobate the practice of some landlords and their shooting tenants of keeping up a large stock of hares and rabbits on cultivated lands to the injury of the crops of the farming tenants.

This paragraph was adopted by the Committee without a division, and it appears in the Report. It is to be hoped that the landlords and shooting tenants to whom it refers will accept the warning thereby conveyed. They cannot without culpable folly pursue a practice which a Committee selected from all sides of the House of Commons has unanimously condemned. They will do well to observe that the recommendation to take rabbits out of the Game-laws was proposed in Committee by Mr. Pell, and carried by eleven votes to seven. A similar proposal as to hares was made by Mr. Clare Reed, and only rejected by ten votes to eight. Mr. Pell and Mr. Clare Reed are Conservatives, but they are also farmers. Among the supporters of Mr. Pell's proposal were Sir Michael Hicks Beach, Mr. Cowper, Sir George Grey, and Viscount Mahon. The concurrence of such men in a proposal to which some of them see serious objections proves that they are strongly impressed with the gravity of the mischief for which they try to find a remedy. Their condemnation of the practice of excessive preservation of ground game ought to suffice without legislative interference, if those to whom it applies are guided by prudence and common sense. We believe that an invitation by Parliament to "all and sundry" to come and kill rabbits on a farm would cause worse evils than it would cure. It would almost compel preservers of winged game to resort to force for its protection, and it would thus be likely to produce breaches of the peace, which would be the cause of fresh and dangerous agitation. Those landlords and shooting tenants whose practice is reprobated by the Committee should remember that they do not exculpate themselves by showing, as frequently they can show, that allowance is made to the farming tenant in his rent. The sight of a field of wheat spoiled by rabbits is offensive to the majority of mankind. Such waste of food is condemned without entering into the question whether landlord or tenant bears the loss. The tenant perhaps receives compensation which is really adequate to the

damage; but he or his friends will always allege that he has been injured, and agitators will probably take up his case, and ventilate it with enormous exaggeration in towns where bread and meat are inconveniently dear.

The landowners who sat upon this Committee have done good service to their class and to the country by thoroughly examining the whole subject of the Game-laws. They conclude that the principle of these laws must be maintained, but that the practice under them is capable of considerable improvement. The Report was mainly the work of the Chairman, and it is a good example of the sort of Conservatism which would be possible in a Government. A sufficient proof of the vitality of the principle of the Game-laws is afforded by the fact that recent legislation has extended the application of the same principle in the case of fish. This legislation has gone beyond the existing moral sense of the community. Fish-poaching is regarded with even more indulgence than game-poaching, and both are viewed quite differently from the appropriation of a fowl or duck. The Chief Constable of Dumfriesshire described to the Committee a state of feeling which doubtless exists on both sides of the Solway Frith. It had, he says, been the practice in Dumfriesshire for very respectable persons indeed to fish from time immemorial, and it was not until the passing of the Acts of 1862 and 1868, which made the penalties very severe, that the fish were protected. The feeling exists in the minds of some very respectable tradesmen and farmers that there is no harm in going to take a fish, and that it is very good sport; and they sympathize very much with the poachers, and think that it is wrong for them to be prosecuted and punished. "I have even known," says the Chief Constable, "a public subscription got up for the purpose of defending a set of poachers and of afterwards paying their fines if they were convicted." Scott has vividly described in a novel the sport of salmon-spearing in the Solway, and the feeling of the sportsmen towards laws or persons that would interfere with it. The feeling seems to have continued to the present time, and it causes serious difficulty in enforcing any law for the protection either of the breed of fish in general or of proprietary rights in fishing. Yet laws for both these purposes have been enacted in the last few years, and there is a general concurrence of opinion that such laws are necessary. The only difference between the case of fish and that of game is, that fish cost nothing to feed, whereas it is alleged, with more or less truth, that game are fed at the expense of the farmer, while his landlord profits by them. Putting aside, however, for the moment the question who feeds hares and rabbits, the worst that can be said against these animals is that they are among the luxuries in which a wealthy nation chooses to indulge. The opponents of the Game-laws may denounce this form of luxury as much as they please, but nobody, and least of all the dwellers in towns, will listen to them.

The evidence as to the production and consumption of rabbits seems to have surprised the Committee who heard it. The number of hares and rabbits produced in the United Kingdom annually is stated to be thirty millions, supplying about forty thousand tons of food; and the collection and manufacture of the skins of these animals furnish employment to many thousands of people. It may be said that, if rabbits are necessary or desirable as food, they may be bred in enclosed warrens, where they would devour no crops that are not specially planted for them. Experiments of this kind are likely to become numerous, but they will always be made under the drawback that the collection of a large number of animals of the same kind in one place seems to invite disease. The rabbit which ranges freely over the fields adjacent to his burrow is said to be more prolific than the rabbit which is confined in a warren, and thus he makes some return for his keep, but not enough to justify his existence in the view of severe economy. In proportion as agriculture becomes more scientific the rabbit is found to be a greater nuisance, but nevertheless we do not expect to see him abolished. No amount of agitation can get rid of the fact that rabbit-shooting is a sport to which many persons are strongly addicted. The hare holds in coursing counties an unassailable position, and if landlords resolved to extirpate him, tenants would interfere for his protection. The whole result of the inquiry by this Committee is that, with good sense and moderation among landowners and shooting tenants, agitation against the Game-laws will not be dangerous. The class of game-preservers is perpetually recruited by men who have made money in trade, and our popular novelists, who reflect the manners of the time, agree in sending their wealthy people to the Highlands in autumn.

The practical question, therefore, confines itself to improvement in the existing law and its administration. Many complaints were urged before the Committee against the Poaching Prevention Act of 1862; but if that Act be what its name implies, the complaints may be supposed to proceed from those who do not desire that poaching should be prevented. It was said by a witness who had good opportunity for observing, that since this Act passed fowl-stealing had become less common. The Act empowers a constable "in any highway, street, or public place, to search any person whom he may have good cause to suspect of coming from any land where he shall have been unlawfully in search or pursuit of game." Mr. Joseph Arch, who stated to the Committee his objections to the Game-laws, complained that his brother-in-law coming home from Warwick rather late at night, with groceries bought for family use, was stopped and searched by a policeman. It was explained to Mr. Arch by the Committee that a policeman stopping and searching a person without reasonable cause would be liable to an action in the County Court. It might

have been added that, if the aggrieved person happened to be destitute of the means of litigation, he would easily find some benevolent society or individual to supply it. If policemen abuse their powers under this or any other Game Act, we have small expectation that they will escape punishment. The strongest objection to the existing system is one that applies not so much to the law as to its administration. Mr. W. S. Walpole, an attorney who has had much experience in cases under the Game-laws, put this objection fairly to the Committee when he said that he thought that, "in administering the law, it is administered with stronger inferences against a poacher than against another man." The Committee saw no reason to believe that there was just ground for dissatisfaction with the administration of the Game-laws by magistrates generally, but they at the same time admit that any considerable amount of distrust in a tribunal tends to impair the authority of the law which it administers. The Committee recommend that day-poaching cases be taken out of the category of criminal offences, and that the option of trial by jury be given to persons accused of night-poaching; and they think that these recommendations would remove whatever ground may exist for complaint against the administration of the law. There may perhaps be differences of opinion as to the exact terms of the law which should be adopted to restrain day-poaching; but it is clear that, whether this law be called a Game-law or a law of trespass, a law of some kind is necessary. Mr. Walpole, who stated strong objections either to the Game-laws or their administration, declared his opinion that, if the Game-laws were to be repealed, a stringent law of trespass must be substituted. Mr. Bartlett, a tenant-farmer of Norfolk, would prefer to make game property; but if that were not done, a stringent law of trespass must be, in his judgment, the alternative. It may not be superfluous to remark that a stringent law of trespass might be worked to the annoyance of pedestrians and excursionists whom recent legislation has inclined to favour. This conclusion, that the only choice lies between a Game-law and a trespass-law will, we believe, be adopted by any candid and careful reader of this Report. The Committee, and particularly the Chairman, deserve credit for having so fully and fairly done their work.

ART AT THE VIENNA EXHIBITION.

VI.

ONCE more evidence is afforded of how greatly the revivals in European art have been aided and accelerated by skilled industries and art manufactures. Of the three leading arts—painting, sculpture, and architecture—painting owes the least and architecture the most to comparatively recent decorative developments. At the same time sculpture, without the surrender of her individual dignity or independence, has deigned, when required, to serve as the handmaid of her elder sister, and thus architecture not only gains surface decoration, but is ennobled by the presence of the human figure. In no way have International Exhibitions proved of more use than in the wide publicity given to whatever tends to the common brotherhood of the arts. Here, in Vienna, we see that the time of isolation is past, that no art presumes to stand alone, that, on the contrary, each seeks aid from the other, all combining together with the one purpose of adding refined enjoyment to human life. Thus the world's arts are the measure of the world's civilization. The city, the church, and the private dwelling are the several spheres of co-operation; and accordingly in the "Welt-Ausstellung" at Vienna are seen the utmost developments now possible to municipal, ecclesiastical, and domestic arts. The topics thus indicated might appear alarmingly large and complex were it not that the ground has been often traversed before. Indeed some disappointment is felt that there is so little new, and that the best of what is new is but the revival of what is old. In fact, the present Exhibition tells the same story as its predecessors; modern art is purest and highest when closest to ancient art. Even that reciprocity between all the arts which is the best hope of the present century is as old as the times of Giotto, the Pisani, Della Robbia, and Cellini.

We have found Austria behind the rest of Europe in painting and in sculpture. By way of compensation she has distinguished herself in architecture. Accordingly, as might be expected, Vienna is foremost in all that pertains to architectural decoration and to the internal adorning and furnishing of private dwellings. The cabinet-work, the glass fabrics, the ornamental leather-work and book-bindings, with other elegancies for the drawing-room and the boudoir, are of an excellence and richness which might naturally be expected in a capital which has long been among the most luxurious in Europe. The taste displayed in these luxuries of life is not always pure; in fact, the Viennese are too lavish of ornament to care for strict style. It must, however, be admitted that no people manage to throw into interiors such sumptuous effect of colour and design—as witness the new Opera House, the Music Verein, and the Arsenal. Moreover, we find in the Exhibition, as well as within the city itself, how much has been done of late years in the way of constructional materials. The large brick edifices which form a striking and novel feature in the city panorama owe their enrichment to terra-cottas and moulded bricks. In the neighbourhood of Vienna are valuable and extensive beds of clay, which were worked even in the time of the Romans. And here, by way of parenthesis, we may observe that all along the Danube, and especially about Pesth, which had the attraction of hot mineral springs, the Romans have made their presence known by arts some of which survive to the present day.

Among these is the art of moulding in clay which, on the banks of the two great rivers of Central Europe—the Danube and the Rhine—never fell into extinction either under Roman or German Emperors. And now, in accordance with the commercial spirit of the age, this important manufacture is in the hands of a commercial company which has its seat of operations in the neighbourhood of Vienna. This immense factory is in itself a colony; between six and seven thousand hands are employed, pensions are granted to the aged and the infirm, a Kinder-garten is maintained for the young, and doctors and a hospital are provided for the sick. It is not often that art and humanity show themselves thus akin. This establishment, which is said to be the largest of its kind in the world, has not only supplied the moulded clay needed for the signal revival of brick architecture within Vienna, but has also made consignments to Italy, Athens, and indeed to all quarters of the globe. It is hard to over-estimate the influence of these art designs, multiplied a thousandfold by mechanism, upon the architecture of modern Europe. The triumphal arch raised as a trophy by Austria is one of the most noteworthy works in the Exhibition, not less memorable than Minton's majolica fountain in the London Exhibition of 1862. This arch, in its polychrome, its low and high relief, and its statues in the round, may be taken as a compendium of all that has been done or can be done in the way of burnt clay. Perhaps it were too much to lay claim for it to any novelty of invention; the value of the products is in their exhaustive character. For instance, as to play of colour, here is a variety ranging from creamy white to yellow, and so through intermediate shades to red, and thence down to shadow colours and emphatic darks. On either side of the arch rise pilasters decorated with arabesques and medallions, and illumined with green and gold. The composition also comprises painted plaques with angels and emblematic figures in relief on a gold ground, and at the summit against the sky are terra-cotta life-size figures in the round. It will thus be seen that an architect is more than sufficiently supplied with structural and decorative materials by which he may carry out the most ornate design without the aid of stone or the intrusion of stucco or paint. We are here reminded of one of the many synchronous revivals in England and on the Continent. Numerous buildings in London and the country prove that our English makers of ornamental bricks and terra cottas are not behind their Continental rivals. The manufacture, in fact, both at home and abroad, has reached the point at which the limit to invention is chiefly economic. In the long run, even in the arts, what pays best prospers best. Unfortunately the published account of the Vienna firm now before us does not include a price list.

Painted windows make but a poor show in Vienna. Were we to judge indeed from the display in the Exhibition, we might infer that the art of painting on glass is on the decline, which certainly would be a false conclusion as to England, and possibly also as to France. In an outlying territory beyond the terra-cotta arch above described is a building placed among beer-halls, especially erected for the advantageous display of painted glass. The collection confirms the belief that Germany lags behind the most favoured nations—a conclusion which will not be called in question by those who do not approve the picture-making process of Munich. A ton among the cathedrals of Germany, beginning with Cologne and ending with Vienna, would not be rewarded by modern glass comparable to that in the Sainte Chapelle, Paris.

In porcelain and ceramics generally there will be little new for people familiar with stalls which have always been the most attractive in International Exhibitions. France again distances all competitors; indeed she is foremost as heretofore both in porcelain and bronzes, just as she is chief in sculpture and the pictorial arts; the reason for this wide-stretching supremacy being her mastery over the human figure and her command of decorative design. England of late years is known to have made in porcelain and earthenware an approach to France; but it is not possible for private enterprise to compete with Sévres, sustained by State subsidy. Once more Italy is conspicuous for Venetian glass as revived by Messrs. Salviati; also for the "Manifattura Ginori," consisting of ceramic figures somewhat after the manner of Capo di Monte. This last revival is praiseworthy rather than perfect. Italian artists with their usual fertility and facility extemporize small groups in clay, but their modelling lacks sharpness, precision, and pluck. A nation, like an individual, is the same in small things as in great—a law illustrated by the great and the minor arts of France, of England, and of Italy.

The collection of Photographs merits a word from its extent and its exceptional character. Here the art of photography may be said to make the circuit of the globe. Not only do the States of Europe, including even Russia, Norway, Sweden, Greece, Spain, and Portugal, send what they deem best worth showing, but North and South America, New Zealand, Algiers, and India serve to make the art commensurate with the civilized world. The collection deserves all the more serious consideration inasmuch as a large proportion of the plates produced are from art works or historic monuments of which photography affords the most trustworthy records. The value of such faithful transcripts is specially proved in the architectural remains of India, Greece, and Italy. One service of International Exhibitions is that they stimulate the production of works of a magnitude which cannot possibly be remunerative.

Mosaics, notwithstanding that they are in less favour than formerly, have not been yet abandoned by England, Italy, and Russia. England in the Potteries still persists in producing earthenware, as distinguished from glass, tesserae; the surface of the finished picture is consequently "matt" or dead, instead of lustrous. It

may be admitted that such a material is a near approach to the stone mosaics of the Romans; indeed this ceramic mosaic is perhaps more fitted for pavements than for walls. Messrs. Salviati, as contrasted with Messrs. Minton, as glass manufacturers, are naturally identified with vitreous mosaics; they have thus sought to revive the compositions in use in Italy in the middle ages, and hence the authorities entrusted with the restoration of St. Mark's have employed materials from the factory in Murano. The rival establishment is that of the Pope in the Vatican; but one of the many consequences of the present position of the Papal dominions, made evident within the Exhibition and elsewhere, is that mosaics from the Roman manufactory are not shown; hence no comparison can be instituted between modern Venetian and modern Roman mosaics. But the two establishments are so much of the same school that in the restorations at Ravenna we have found tesserae from Venice and from Rome used indiscriminately; yet preference is given to the latter. In truth, Roman mosaics from the Vatican are the finer of the two. To this Roman school belong the elaborate figure-pictures which in successive International Exhibitions have come from St. Petersburg. Indeed the Russian Government, at the time when the exigencies of the Church called for extended mosaic decoration, at once set up in Rome an infant manufactory, wherein students from the Imperial Academy on the banks of the Neva were instructed in the technical processes of mosaic-making. The results are now patent in Vienna in the group "Jesus Blessing Little Children," and in the single figures of "St. Catherine" and "St. Anastasia," severely executed for the Cathedral of St. Isaac from the designs of Professor Neff. It is an old story that Professor Neff is best known by certain naked nymphs which in the Hermitage are more often copied than any other pictures. And it is the misfortune of Russia, in her manufacture of mosaics and in her revival of other arts, that she severed herself wholly from local and historic styles such as the Byzantine, and plunged headlong into meretricious modernism. Thus it has been the fatal fault of the mosaics which from time to time she has exhibited in Western or Southern Europe that they are of the nature of pleasing easel pictures rather than severe monumental works fitted to hold a place in noble architectural structures. And yet some of these mosaics are far too ponderous to serve as pretty playthings. For example, we have seen in the Imperial manufactory in St. Petersburg a "Last Supper" which, before it reaches its destination in the Cathedral of St. Isaac, will have cost four years' labour, will have needed three hundred thousand tesserae, and will have reached a total weight of ten tons. We could wish that space permitted us to recount the efforts made by Russia in other directions for the development of the arts within her vast empire. In Vienna we were disappointed not to find more products from the Ecole Stroganoff, Moscow; the works exhibited in St. Petersburg three years ago gave proof that in the art schools of Russia national styles handed down through many centuries serve as the basis of instruction. The motives by which these movements have been actuated are set forth in two pamphlets published in St. Petersburg—the one a statement respecting "the Society for the Encouragement of the Arts," the other an eloquent dissertation by M. Boutovsky, Director of the Stroganoff School at Moscow, on "Education applied to Industry in Europe, and particularly in Russia." At Vienna other signs are not wanting of approaching developments within the Russian Empire.

In fine, in Vienna we are once more led to the conclusion that of recent years progress has been chiefly in the direction of the subsidiary arts. While sculpture and painting have been stationary, if not in actual retrogression, those arts of decoration which bring to a nation pomp and to private life luxury and refined enjoyment have throughout the length and the breadth of Europe found unexampled development. This power of art production, this capacity for art progress, have been mainly promoted through improved mechanism and a more highly educated taste. Each successive Exhibition proves how close is the race for pre-eminence among all civilized nations. And it is satisfactory to find that England, who at the first start was lamentably in the rear, is now found among the foremost ranks in the arena of art.

NEWMARKET FIRST OCTOBER MEETING.

MIEFEVRE and Fordham, according to their wont, opened the autumn campaign at Newmarket, Tourbillon winning the Trial Stakes after a pretty race with Dalmacardoch, an old handicap acquaintance, Cedric the Saxon, being beaten off. As Tourbillon was entered to be sold for one thousand sovereigns, and Dalmacardoch for three hundred only, the two horses met at nearly even weights, Dalmacardoch thus having the advantage of two years' seniority without any corresponding penalty. A far greater triumph was in store for the French colours in the next race but one, the Grand Duke Michael Stakes, in which Doncaster essayed to give Flageolet 7 lbs. Considering that Flageolet has twice beaten Doncaster this year at even weights, we are at a loss to know why it was looked on as a certainty that on this occasion Mr. Merry's horse would be able to give weight away. Perhaps it was the fine race he run with Marie Stuart for the St. Leger which inspired his supporters with confidence; and possibly the course—across the flat—may not have been thought long enough for Flageolet. Anyhow the confidence reposed in Doncaster never wavered, particularly as he appeared to be in the best possible condition. The antagonists of the pair were Andreu, Cobham, and

Laird of Holywell; but their chances of success could hardly be seriously entertained. Laird of Holywell was started to make the running for his stable companion Flageolet; and he performed this office to the best of his ability for three-quarters of a mile, when Flageolet had to take up the running for himself. Even before this, however, Doncaster, it had been observed, was in difficulties, and at the Bushes, to every one's astonishment, he was not only in difficulties, but hopelessly beaten. From that point Flageolet strode away at his leisure, and won ultimately in a canter by six lengths. If Doncaster's defeat by Flageolet was only in accordance with the previous running of the pair, what can be said of the inability of Mr. Merry's horse to get in front of animals like Andred and Cobham? It may be that Doncaster is a weak-constituted horse, who can only show to advantage now and then; or it may be that his punishing race at Doncaster with Mario Stuart took the steel out of him; but in any case it cannot be supposed that this is Doncaster's real form. The miniature Cambridgeshire, as the Great Eastern Handicap may perhaps be termed, attracted as usual a large field of twenty-one, the starters including Modena, Roquefort, Sister Helen, Miss Stockwell, Landmark, Glaucus, and other speedy animals. A pretty finish between three of the light weights, Day Dream, Sister to Eltham, and Delay, resulted in the victory of the first named by a short head, while Sister to Eltham beat Delay for second place by a neck. The winner, a four-year-old, with 6 st. on her back—was leniently treated, considering that she has won several races. Last year she ran five times, and was victorious on three occasions. The Great Eastern Handicap is now decided on the Bretby Stakes course, instead of the T.Y.C., and therefore it is not quite such a scurry as it used to be. Whatever got the best of the start on the T.Y.C. was pretty sure to win; but the finish of the Bretby Stakes course takes some doing.

The Buckingham Stakes met with the common fate of the few rich sweepstakes which still remain, and ended in a walk over. Neither Mr. Crawford, Mr. Merry, Mr. Savile, nor Mr. T. E. Welker cared to send one of their representatives to the post, and so Lord Falkmouth had all the forfeits to himself with the moderate Atlantic. The Boscawen Stakes, however, did attract three out of the five entered; but it was a mere canter for the rapidly improving George Frederick, who disposed of Tripavay and Juvenia with the greatest ease. And then, over the easy last half of the Abingdon mile, Couronne de Fer secured the Hopeful Stakes from Mr. Winkle, Regal, Kidbrooke, and Lady Mary. It was a field of winners, and every one of the five was penalized, Couronne de Fer and Lady May carrying 6 lbs. extra, and the other three 3 lbs. extra each. Though a small, it was as select a company as has met in a two-year-old race this year; but the extreme ease and shortness of the course prevent this race from ranking in importance with the Champagne or Woodcote Stakes, or with the other principal two-year-old races of the season. The Middle Park Plate, of course, stands by itself without any rival. Couronne de Fer won, as we have said, but was hard pressed by Mr. Winkle, whose form throughout the season would only entitle him to rank in the second class; so that the winner's reputation must rest on his two victories at Stockbridge, which were undoubtedly great performances. It will be remembered that at the Hampshire Meeting Couronne de Fer first beat Napoleon III.—who subsequently won the Champagne Stakes at Doncaster—and a large field for the Hurstbourne Stakes, and then, about an hour and a half afterwards, won the Stockbridge Cup, carrying a heavy penalty, from Suleiman, Hirbeck, and four others. Both these races also were won in a canter, and when mentioning a few weeks ago that Marsworth and Écossais stood considerably above the other two-year-olds, we were perhaps wrong in not associating Couronne de Fer with them in the supremacy. His narrow victory in the Hopeful Stakes goes for little in our estimation, on account of the nature of the course. The Twenty-fourth Triennial for four-year-olds, over the trying course from the Ditch in, was walked over for by Ullin, not one of the thirty-four entered caring to oppose Mr. Savile's hardy son of Ranger. And with this the first day's racing was brought to a conclusion.

The sport on the second day was of a much less interesting description. We had a sight of Kaiser at the commencement of the proceedings; but his opponents, Tambour, His Grace, and Marquis Townshend, were too moderate to give him much trouble in carrying off the Newmarket St. Leger, run, like the last race on the preceding day, from the Ditch in. He carried a 5 lbs. penalty, but beat Tambour easily by five lengths. Nor do we think that M. Lefèvre succeeded in gaining much line for his Cesarewitch horses; for, though it was said that Kaiser tired very much towards the finish and swerved suspiciously, yet Tambour most certainly never got on terms with him during the last quarter of a mile; and if Kaiser was tiring, there was all the more chance for Tambour to make up some of his lost ground. We do not consider Kaiser by any means a first-class horse; but he is quite good enough to win a race of this description, without enabling his opponents to take his measure. A Welter Handicap, over the T.Y.C., fell to the top weight Blenheim, who was giving two stones to The Knight, a five-year-old like himself, and almost the same weight to Ringwood and Bordeaux, also five-year-olds. And Wild Myrtle won the Twenty-fifth Triennial, across the flat, though only by half a length from Princess Christian, who might have got even still nearer had she not been disappointed at the moment of making her effort.

Thursday's racing began with the Rutland Stakes, which brought out Blantyre, one of Mr. Merry's dark two-year-olds. He

was opposed by Beaconsfield, Periwig, Sweet Note, and four more, and just managed to make a dead heat with the first-named in the last stride. It was the general opinion that Beaconsfield ought to have won, and that he would be certain to win the deciding heat; however, a division of the stakes was agreed upon, and Baron Rothschild's horse walked over. Blantyre will have to improve very much on this form, or his pretensions must have been vastly overrated. Again in the succeeding race, a Two-year-old Sweepstakes over the T.Y.C., we had a field of winners, five out of the six runners being penalized for previous successes; and Eve, with 4 lbs. the better of the long-suffering Mr. Winkle, for whom there is apparently no rest in this world, pulled through by a neck, Mr. Winkle beating all the remainder easily. The growing reputation of George Frederick was still further strengthened by his clever victory in the Triennial on the T.Y.C. over a large field, including Folengo, Regal, and Beaconsfield. Mr. Cartwright's Brother to Albert Victor only won by a neck, but he ran with great gameness, and is deservedly a prominent favourite for the Middle Park Plate, which will be decided next week. There was a very poor field for the Cesarewitch Trial Handicap, over the Cesarewitch course, which could not by any possibility have thrown light on the great handicap of next week, unless indeed M. Lefèvre's representative, Manille, had won in a canter. As it was, he was beaten in a canter by Mr. Crawford's Royal George, while Baron Rothschild's Hippia filly never showed prominently in the race. Yet the position of Moissonneur and Corisande in the Cesarewitch market was not affected in the slightest degree. Far better was the Queen's Plate—also run over the Cesarewitch course—which furnished a very fine struggle between Eole II., Shannon, and Lilian. M. Lefèvre's horse winning by a neck, and Shannon defeating Lilian for second place by half a length. The pace, however, was very indifferent till just towards the latter part of the race, there being no second string to force the running; but it is something to see a contest of any kind for a Queen's Plate, and they did gallop all the way, although not very fast.

A quiet day's racing on the Friday wound up an interesting if not specially eventful week. Sixteen ran for the October Handicap, including Laburnum, Proto-martyr, Enfield, Lord Gough, Nobleman, Barnston, and Androcles—winner of the French Cesarewitch last Sunday week. The winner, however, turned up in Tielborne, who had been nowhere in the Great Eastern Handicap, but had run second to Blenheim in the Welter Handicap on the subsequent day. The victory was easily accomplished by three lengths, and Lord Gough was second; while the old horses, light as were their imposts—Nobleman, 6 years, 7 st. 2 lbs.; Barnston, 5 years, 6 st. 8 lbs.; and Enfield, 6 years, 7 st. 5 lbs. for example—could never get near the front. M. Lefèvre and Fordham appropriately wound up the week, as they began it, with a second victory of Tourbillon, over Maid of Perth, Auricomus, Lincoln, and five more, and the finish between Tourbillon and Maid of Perth was one of the finest things of the meeting. The winner was conceding to Mr. Long's filly the year and 4 lbs., and just beat her by a head.

At the meeting of the Jockey Club held during the week Lord Coventry brought forward the motion of which he had given notice, that for the future three-year-olds and upwards should not be allowed to run in any race of a shorter distance than a mile; but he must have well known that he had little chance of support. We were rather surprised to find that he succeeded in obtaining a seconder; but he did accomplish that and no more; the whole meeting of, we think, twenty-four members, with the exception of the proposer and seconder, uniting to insist on things being left as they are, and on the country being inundated with worthless racing stock, unsound, infirm, roasters, and such like, that find a mile very much too far for them. So far from the Jockey Club showing any disposition to move forward in the direction pointed out by those who are anxious to preserve a national sport in such a way that it may be beneficial instead of detrimental, as it now is, to the country at large, we are quite prepared to see them before long take more than one retrograde step. It is currently reported that a strong effort will shortly be made to obtain the repeal of the law not long ago passed, prohibiting two-year-old racing before the 1st of May. Clerks of courses are all up in arms against that law; and it is believed that there is a strong party in the Jockey Club bent on seeing it rescinded. The Jockey Club has never showed any effectual zeal for the reform of the Turf; such reforms as have been made have been secured by chance divisions more than by any active co-operation on the part of the Club. And now that some of the best supporters of racing are abandoning it, and the places of others in the council of the Turf are vacant, it is but too likely that what little good has been done will be undone.

REVIEWS.

TWO SCHOOL HISTORIES OF ROME.*

WE must again do our duty by clearing off a few of the books of this kind which gather on our table by heaps. And the

* *Analysis of Roman History. A Text-book for the College, the School, and the Private Student.* By William C. Pearce. London: Longmans & Co. 1873.

* *A Catechism of Roman History.* Edited by Elizabeth M. Sewall. London: Longmans & Co. 1873.

duty is rendered one degree less irksome when we can discern any good thing in any one among the crowd. Now, though we do not see that Mr. Pearce had any particular call to meddle with Roman History, yet we do not feel any such distinct call to warn him off the subject as we often do in such cases. He has got a long way beyond Goldsmith and Lompière, which we take to be the great authorities for many of his brother-compilers. Mr. Pearce does not seem to be much of a scholar; indeed a good many passages seem to show that he does not understand the Latin tongue at all. But he has, at least during the central part of his History, read and made very fair use of some of the best modern books on his subject. His chief guide seems to be Dr. Ihno, but he has also laid a good many other writers, from Niebuhr to Mommsen, under contribution. By this means he has got a very respectable notion of the Roman Commonwealth and its changes, and during a good part of the book he distinctly rises above the level of cram. Some of Mr. Pearce's general sketches of particular periods are much above the level of books of the kind. It may be that the standard of this sort of thing is so very low that we value the least glimmering of sense more than it deserves. Still, where the standard is so low, it is something when we light upon anything from which we do not turn away at the first glimpse. Of course these small books can never be really well done except when real scholars stoop to take them in hand. But as long as they are done by persons of Mr. Pearce's class, it is only fair to point out one who, like Mr. Pearce, does much better than the mass of his class; and this we can honestly say of the central part of his book, the history of the Commonwealth. At the beginning and ending he breaks down. It is of course the very hardest thing to know how to treat the mythical part of the story. It cannot be left out altogether. The world would hardly stand a History of Rome without any Romulus and Remus at all; and though the story of Romulus and Remus is not history, yet the fact that such a story arose is undoubtedly part of the history; and when from Remus we get on to Tattius, we get to something which, though certainly not history, is we may be quite sure the legendary expression of a real prehistoric state of things. Besides, simply as stories, the legends are so famous and often so beautiful in themselves that no one could wish to get rid of them altogether. We must then keep our legends, and the only thing to be done with them seems to be to tell them as stories, at the same time clearly explaining that they are merely stories. But this at once needs a good deal of room, and it needs a power of telling a story which all people have not. But in any case the stories must not be told as if the writer really believed in them, and above all they must not be told in the high-polite style. You may tell the story of Numa and Egeria as the fairy tale which it is, and explain that nobody is to believe it, and all will be well. But if you talk about Numa and Egeria in exactly the same tone in which you talk about Pompeius and Caesar, though you do put a note to say that the story is legend and not history, this effect is not gained. In this Mr. Pearce breaks down. He breaks down at both ends, by failing to connect the history of Rome with that general history of the world of which it is the central act. This, the great lesson of Roman history, is of course what a crammer and compiler, even if really intelligent, cannot attain to. To put the history of Rome into its right place at both ends, it needs one who has really read and thought for himself, and who has learned to grasp that general view of history into which the history of Rome fits in as only a part, though by far the greatest part.

In this point of view the history of the Commonwealth and the history of the Empire are equally important, though their importance is of different kinds. The Commonwealth is greatest as a political study, as the piece of history which gives us the widest field for comparison with other Commonwealths before and since. The importance of the Empire is owing to its being the dominion out of which the nations and states of modern Europe have risen. It is owing to the duration of the laws and tongue of Rome and of the creed whose range has been co-extensive with the range of Roman influences. This is the real Roman history, and by one who really has general history at his fingers' ends it may be put into a very small space and into very plain words. But all this is beyond the compiler. Ho may, as Mr. Pearce has done, get a fair notion of the wars and revolutions of the Roman Commonwealth, because that may be got by reading a few of the best books specially devoted to Roman subjects. But to teach the real lesson of Roman history, to put Roman history into its proper place at both ends, is quite another matter; and here Mr. Pearce breaks down, as any compiler must break down. Besides this, Mr. Pearce does not seem to have given the same kind of care to the history of the Empire which he has given to that of the Commonwealth. We do not see the same signs of the influence of good modern books. Of all ages of the world, the centuries from Augustus to Charles the Great—and Arnold was undoubtedly right in fixing the coronation of Charles the Great as the point at which a History of Rome ought to stop—most need grouping into periods. To learn the names of a succession of Emperors, and to do nothing more, is simply useless. Or rather it is impossible; the mind refuses to remember them, and it might in truth as well be asked to remember the *Consular fasti*. Mr. Pearce, who gives each Emperor or pair of Emperors a separate paragraph and heading, is misled by the example of Histories like those of England and France, where the reigns of the Kings do make a convenient arrangement and something more. But the mere difference between the average length of

their reigns and that of the reigns of the momentary Emperors of the third century is a most practical difference in the matter of learning and remembering. The great Illyrian Emperors of that date are most important as a class, and they mark a stage in the history of the Empire which cannot be too deeply impressed on the mind. Many a reader will be able to carry off a very useful notion of their general historical position without keeping their exact succession in his head; but an attempt to remember their names and order without a clear idea of their position in universal history is altogether vain. Of course we do not expect writers of this class to understand the continuance of the Roman Empire after the time conventionally fixed for its end. They are one and all, Mr. Pearce included, in the state of mind which cannot be so well set forth as by their own formulas, which of course make Augustulus the last Emperor and turn the Patrician Odoacer into a King of Italy.

We have run on at this length mainly because Mr. Pearce is in a marked way better than most of his class, so that his failures show better than a worse example how worthless the whole class of thing is. As for style, Mr. Pearce of course writes in the grand style, though not in a very offensive variety of it. But the most curious thing is what we have already hinted at, his seemingly total ignorance of the Latin language. It is funny when we are told that the slaves who were set free by Sulla were called "the Cornelia." But this, if it stood alone, might possibly be a misprint; and anyhow it would not be worse than when Mr. W. O. Hazlitt talked about "Manuel Comnena." But when we come to a "lex frumentum," we see that we have got into the same region as the argument that "brum" meant a stick, because "candelabrum" meant a candlestick and "candela" a candle. "Lex frumentum" must be Latin for a corn-law, because "lex" is law and "frumentum" is corn. Mr. Pearce of course had often enough seen a "lex Julia" or "Cornelia" referred to, to know that "lex" should come before "frumentum," and not the other way. But the odd thing of all is that a man who has really picked up a very fair notion of what the Roman "plebs" was, should fancy that the name is the plural of the singular "pleb." We can at least hit on no other explanation than Mr. Pearce's practice of calling any particular plebeian a "pleb."

The other little book which we have before us sets us against itself, perhaps unjustly, by being in the form of question and answer. Miss Sewell gives a defence of catechisms in her Preface, from which we learn that they are "useful adjuncts, but nothing more"; and also that "in the use of a catechism it is well to make the pupil learn the question as well as the answer." We infer then that there is somewhere or other a class of beings so ill-fated as to be set to learn this kind of thing by heart. Now we know perfectly well what this means. With the mass of teachers it has simply to be said by heart, and the change of a word, which may really show intelligence and thought, is dealt with as a mistake quite as deadly as to go utterly wrong in the facts. And the time of which we have just been speaking at some length seems of all times the least suited for this kind of treatment. It must be hard indeed to get any clear general view of the great transitional period in the form of question and answer, and no good that we know of can possibly come of learning by heart little stiff statements about Constantine, Valentinian, Alaric, and the rest, winding up of course with Odoacer, King of Italy. We must however say for Miss Sewell that she makes a successful effort to be fair, and does not make out Constantine to be a saint and Julian to be a monster. At the other end Miss Sewell attempts something more than Mr. Pearce; she seems not to have reached the Aryan stage, but she has reached the Indo-European stage. But the reason for the latter name strikes us as rather funny. We must however give the first two questions and answers in full, as a curious specimen of one of the halting-places on the road between utter darkness and perfect light:—

What is known as to the primitive inhabitants of a great part of Italy, Greece, and the Islands of the Ægean Sea?

Very little is known with certainty. They are commonly termed Pelasgi, and it is thought that they belonged to a branch of the great Indo-European family of mankind, which derived its descent from Japhet, the youngest son of Noah.

Why is this division of the human race called Indo-European?

Because a portion of the family migrated to the east, towards the river Indus, and a portion settled in Europe.

We will venture only two remarks—that if they are commonly called Pelasgi, it would be well to leave off calling them so; and that, on behalf at least of the Nether-Dutch branch of the family, we must decline the descent from Japhet and dispute the position of Japhet being the youngest son of Noah. We need hardly say that the descent of Woden from Noah is at least as clearly made out as the descent of the Marquis of Westminster from Hugh of Avranches. But then the pedigree is not traced up through Japhet, but through Noah's yet younger son, Scaaf, who was born in the Ark.

It is hardly worth while to go through the Catechism at any length; it seems fair enough as things go, but we want to know what is meant by saying that the two great divisions in the Roman State were "the patricians, or full citizens, and the plebeians, or subject people, who were unattached as clients to the patrician families." Does this mean that the plebeians were the same as the clients or that they were not? As both views have been held, it would be as well to make it more clear which is meant. And at a further stage we should like to know what is meant by saying that when the younger Cæsar received his title of Augustus and his various special honours and commissions, "the office of Consul

ceased to exist." We need hardly say that the office, as all other offices, went on as before, only a new power arose which overshadowed them all. We mark this the more because Miss Sewell has taken evident pains to point out what the nature of the Imperial power in its first stage really was.

DRUMMOND'S LIFE OF ERASMUS.*

MR. DRUMMOND, as a biographer of Erasmus, has proposed to himself a definite plan, and carried it out consistently. Avoiding generalities and historical digressions, he has kept as close as possible to the correspondence and works of Erasmus. Nothing could be more proper than such a course; for Erasmus, if anything, was a writer. He might have used of himself by anticipation the words of the late Mr. Buckle—"I live merely for literature, and my works are my only actions." The one great practical effort he made was to extricate himself from the monastic system in which he became entangled when young; and, this accomplished, his only continuous care, apart from literary matters, was to find the means of life, and to continue free. In both of these aims he succeeded, as a man of his extraordinary power had a right to do. He was superior to the sordid mysteries of mere economy; when he wanted money, or thought he was in danger of wanting it, he begged, he sought out patrons, he made parade of his poverty to his friends, but he never tied down his genius to mechanical and distasteful work. He was one of the most industrious of men, but his industry must flow in its own channel; he could not submit to teaching if it stood seriously in the way of his learning, or accept permanently a professorship which would keep him from running away from the plague. In fact, he took just the course which, if he had been an inferior man, would have ruined him. His delicate health and fastidious tastes, together with his frequent journeys, made his mode of life decidedly expensive; but while his expenses were regular, his way of meeting them was irregular. We know what are the prospects of an artist without private fortune, who will not paint portraits, who is fond of travelling, and believes that good French wine is necessary for his constitution. He registers himself beforehand for failure; but Erasmus did not fail. When old age was coming on he found himself a comparatively rich man. He could buy a house and alter it, and sell it again, without being at all impoverished. He had rings in abundance, and gold and silver plate, and plenty of money, yet he had not parted with his liberty. He was on terms of respectful freedom with Popes; he was courted by kings; he was an Imperial councillor, and was recognized both by reformers and adherents of the old faith as a distinct power in the world of opinion. In those difficult times he could not maintain his independence without occasionally playing his friends as well as his enemies against each other, but to the very last he was independent of each, if not of all. He carried out the policy of the *bascule* as cleverly as M. Thiers, and longer. The very circumstances of his death have an ironical propriety which may have consoled him in his agonies. When the Mass was abolished by public authority at Basle, he left the place, much as he loved it, to live at Freiburg in close and not unfriendly proximity to monks and canons. But he ultimately returned to Basle and died among his Protestant friends, declaring indeed to the last that, as he did not agree with them in doctrine, he would rather end his life elsewhere, but nevertheless preferring their company to that of more orthodox folk.

A writer so acute, so ingenious, so elastic as Erasmus, becomes an object of some suspicion when an endeavour is made to interpret his life and character by means of his letters. It may be said that his letters need rather to be interpreted by his life; he was too clever to be caught tripping in words, or to be safely taken at the estimate which he himself suggests. But, in the first place, Erasmus, as we have already observed, did very little except write; and, in the second place, his letters are so varied that they must exhibit most phases of his character. Their very number is some security against unfair selection and manipulation. Eighteen hundred of them are published, including some contributions of his correspondents, and he said that he sometimes wrote them at the rate of forty a day. Reserve and disguise were not his foibles; he was an incautious talker and a tolerably open writer. He had no scruple about committing his real thoughts to paper, provided always he committed them in a graceful and scholarlike style. There were some correspondents, of course, who required a peculiar treatment, and there were some doctrines and opinions which Erasmus, both in his books and his letters, found it prudent to respect. But he had a pleasure like that of a good pilot in keeping just clear of the rocks; and the irony in which he indulged is at once visible and transparent. When we know that he could ask favours perseveringly, and be liberal, though not fulsome, in flattery; that he could evade unpleasant controversies which he could not directly decline; that he formed many real friendships, and, though not exactly a good hater, could allow himself to be tolerably spiteful if he was ingenious at the same time; that, notwithstanding occasional expressions of humility, he valued himself at his true value—in other words, very highly; that he was incapable of either the virtues or the vices of a genuine monk, and believed, in common with a great many moderns, wine and good cheer to be necessary for brain-work,

we really know a good deal about him. His letters are often only variations on familiar themes, and we are obliged to Mr. Drummond for interpreting these variations so pleasantly. In the hands of his translator, as in the original Latin, Erasmus is a smooth and copious writer, wearing his learning gracefully, and showing no disposition to pedantry. Mr. Drummond's translations are often free, but they are seldom really inaccurate, and are sometimes very happy. The only mistake of importance on which we have hit occurs at the close of the first letter of Erasmus to Luther, where he is made to say, "When I wrote this your letter had not reached me." Now, as Erasmus begins by acknowledging that Luther's letter shows both a truly Christian spirit and great abilities, he could scarcely conclude by saying that he had not received it. His words are—"cum hæc scriberem, tua epistola ad manum non erat"; that is, "I have written this without having your letter at hand." Here is a good example of the kind of caution which Erasmus exercised. After writing in a friendly tone to Luther, and giving him some excellent advice, he guards his remarks by hinting that, after all, they may not be much to the purpose. He tells Luther, as he often told Luther's opponents, that he had not read his books, and he wishes it further to be understood that no very precise reply is given to his letter.

Mr. Drummond's biography loses much of its placid interest, and becomes rather intricate and perplexed, when, at the beginning of the second volume, it reaches Luther and the Reformation. We cannot blame it on this account, for it is so far quite true to the life of Erasmus. The elegant scholar, who disliked the coarseness of the monks quite as much as any errors in their doctrine, was sadly perplexed when a monk who had escaped from the cloister appeared in the character of a violent reformer, and made culture merely an instrument instead of an end. When Erasmus substantially agreed with Luther, he disagreed with Luther's manner of putting things; and indeed the points on which the two men were of one mind, though not unimportant, were comparatively superficial. Luther opposed the whole Roman system; Erasmus liked the system well enough if only he could remove its abuses. To Luther the Pope was Antichrist; to Erasmus he was a high ecclesiastic with whom, personally, it was convenient to be on good terms, and whose somewhat indefinite supremacy might be useful, if not pressed too far. Erasmus edited the Fathers, Luther reviled them. Luther clung, with a passion not far removed from despair, to every text of the Bible that told of Christ, and gave him hope and comfort; Erasmus was curious in various readings, and calmly paraphrased the New Testament book by book. Erasmus, in defending free-will, was, in his own opinion, defending common sense; in Luther's, he was attacking grace. Luther's favourite doctrine of justification by faith was simply unintelligible to Erasmus, as it is to most persons whose notion of personal religion is a quiet growth in grace, and not a new creation which is liable to be attended by convulsions. The following remarks of Mr. Drummond are a fair statement of the case for the defence when Erasmus is charged with timidity and vacillation:—

Whatever inconsistency Erasmus may justly be chargeable with for remaining a member of the Church of Rome, it was simply impossible for him to join the party of Luther; and the best answer that can be made to any charge of dishonesty or cowardice that may be brought against him on this ground is simply this—that he never concealed his sympathy with the Reformation as long as it only went his own length, but the moment it went farther he declined to follow it. From the beginning to the end of his career he remained true to the great purpose of his life, which was to fight the battle of sound learning and plain common sense against the powers of ignorance and superstition; and, amid all the convulsions of that period, he never once lost his mental balance. It is no small thing to be able to say of any one that his mind was never hurried into excess, and never suffered reaction. But that is the simple truth as regards Erasmus. When his friend Sir Thomas More had abandoned the generous principles laid down in his "Utopia," and was writing in no gentle language against Tyndale and others of the reformed school, Erasmus quietly continued his work, scarcely moved by the changes around him. What he had been at the first he continued to be at the last. He had always declared that he desired to teach nothing that was at variance with the doctrines of the Church, and that, if any such proposition could be pointed out in his works, he was ready to retract it. He never ceased to attack and ridicule the corruptions of the Church, and to labour for the reform of its manners and discipline.

It is not so easy to find any modern parallel that is tolerably precise for the position of Erasmus in his day. Mr. Drummond compares it to that of our own Broad Churchmen; but, as a rule, Broad Churchmen do not content themselves with being practical reformers. They aim at speculative width, and rejoice, or try to rejoice, in an enlargement of the intellectual horizon which would have struck Erasmus and Luther alike as portentous. Erasmus died some years before the first session of the Council of Trent; and even if he had lived long enough to witness that new outburst of the dogmatic spirit, there was no earlier body of doctrine to which he could turn back, as the Old Catholics in our day have done to the Council of Trent itself, and make it the basis of resistance. It was not doctrine he sought in the New Testament, but edification and a field of congenial labour. The collectors of manuscripts and writers of notes are no longer, *ipso facto*, dangerous persons. They will be as often found on the side of moderate orthodoxy as on any other side; but Erasmus, to suspicious eyes, was not even moderately orthodox. His classical culture made him decidedly sceptical; and with him, as with Mr. Matthew Arnold, literature and dogma were antagonistic. Of course his conclusions fell far short of Mr. Arnold's, but then he began by being a monk, and never ceased to be an ecclesiastic.

Mr. Drummond, who is copious on the relations of Erasmus to

* Erasmus; his Life and Character as shown in his Correspondence and Works. By Robert Blackley Drummond, B.A. 2 vols. London: Smith, Elder & Co.

other learned men, says but little of his relations to artists; yet the point is one which will bear some working out. With Holbein Erasmus was on familiar terms, and one of the few pieces of evidence which are extant with regard to the character of Holbein's private life occurs in connexion with "The Prize of Folly." Among the humorous illustrations made by Holbein to that work, and still preserved at Basle, is a picture of Erasmus himself sitting at his writing-desk; and against this picture, as Mr. Drummond tells us, Erasmus wrote in Latin:—"Ah, if Erasmus were still like that, he would certainly marry!" But this is not all. Under another illustration, representing an ugly, sensual fellow drinking out of a bottle which he holds in his left hand, and clasping with his right arm a woman round the neck, Erasmus wrote the name of Holbein. The drawing is one of the coarsest of the series; and in the engravings of the Leyden edition of Erasmus it has been thought better, probably from respect to the great man, to leave out the woman and modify the toper. This certainly looks as if Erasmus, who was not himself always above the suspicion of conviviality, was on terms of familiarity with Holbein, whose tastes were probably more pronounced in the same way. It was by Erasmus that Holbein was introduced to Sir Thomas More, and a beginning was thus made to his career as a portrait-painter in England. Erasmus was acquainted with another great painter, Albert Dürer; and the two eminent men were brought nearer to each other by having a friend, Billibald Pirkheimer, in common. But when brought together they did not coalesce. Erasmus told Pirkheimer that Dürer began to take his portrait at Brussels, but did not finish it; the sitting was broken off by a quarrel, which Erasmus says was about some trifle. The picture seems to have been painted at last, and sent to Erasmus, who was not pleased with it. "If it is not like," he observed, "that is not surprising, for I am not the same man that I was five years ago." Though the quarrel may have begun about some small matter, a difference of opinion about the Reformation probably lay at the bottom of it. Erasmus could not follow Dürer in his strong admiration for Luther; and Dürer, in a famous passage in his journal, written when Luther was hidden in the Wartburg, and was supposed to have been carried off by his enemies, calls on Erasmus to take the side of Christ, but in rather a despondent manner. Erasmus, he says, may yet win the martyr's crown, although he is old and a mannikin.

We have here stepped a little beyond the letters of Erasmus, which mark for the most part the circuit within which Mr. Drummond confines himself. He quotes the letters largely, and writes in a style which harmonizes with them. He has thus attained an equable flow and a studied moderation of purpose which make his volumes very pleasant.

THE EGYPTIAN SKETCHBOOK.*

MR. LELAND, as our readers probably know, is the author of the *Britannia Ballads*. There is, we believe, some difference of opinion as to the merits of that peculiar specimen of American humour. Some readers obstinately refused to see that there was anything funny in them at all, except the very poor fun which depends upon eccentric spelling. Our own opinion was that they contained a genuine, though not a very profound, vein of humour; which moreover had the merit of being the humour of a cultivated man. Be this as it may, Mr. Leland evidently considers himself entitled to indulge in the vagaries of a professed humorist. Nobody can say, whatever other criticism he may be disposed to make, that the *Egyptian Sketchbook* does not contain a large number of unequivocal jokes. Of their quality we will speak directly; but at least they are unmistakably facetious in intention. He tells good stories, derived from all kinds of sources; he makes puns, and he throws the reins upon the neck of his fancy, and carvers away in search of oddities much as Southey did in the *Doctor*. There are a good many descriptions of Egyptian life and manners in these pages; and they are not, we are happy to add, descriptions of those objects of conventional admiration which have been described and redescribed until we are almost sick of their names. But a large, probably the largest, part of the book is deliberately intended to be simply amusing; and we are not a little startled when in the last page he informs us that his real desire was to "grapple with the tremendous social and industrial problems which this wonderful country presents." By way of giving a colour to this statement he adds that the great practical problem of Egypt is the "want of fuel," and he states that there is a good deal of fuel in America. Probably this is intended as a ponderous joke; inasmuch as the problems have been chiefly conspicuous by their absence up to the last moment, with the exception of a few rambling remarks upon the social and national characteristics of the different Egyptian races. At any rate we shall not enter upon the field of speculation thus suggested, but confine ourselves to the attempt to give some notion of Mr. Leland's merits as a writer.

And, first, of his facetiousness. Are his jokes really good or bad? We confess that we must answer this question with some diffidence. The most difficult task that a critic can have is to pronounce upon the merits of a new poet. Innumerable failures are before his eyes, and he has an uncomfortable feeling that he may be pool-poohing an immortal Keats or puffing an ephemeral

Alexander Smith. But next in difficulty is the task of discriminating between genuine and counterfeited humour. A very large proportion of what passes for humour in the present day is probably mere slang and vulgarity, fitted to make ignorant people laugh for the moment, but soon, it is devoutly to be hoped, to be shovelled on to the dust-heap, where are decaying vestiges of the nonsense by which our ancestors condescended to be amused in their day. On the other hand, we know that it was a long time before the rich and delicate humour of Charles Lamb met with any adequate appreciation; and possibly we may condemn as mere eccentricity work that has in it genuine pathos and vivacity. The appreciation of humorous writing depends so much on the accidental moods of the reader, it looks so different as the light falls upon it from different angles, that we should not express an offhand opinion without some misgiving. Making this reservation, however, we will venture to give our estimate of Mr. Leland's performance. And, in the first place, we may say unhesitatingly that, however funny he may be, he thinks himself funnier than he is. He makes a great many jokes which are simply failures, and others which we are afraid are simply vulgar. Indeed it would be easy enough to make quotations from his pages which would apparently justify a summary condemnation of his "Sketchbook" as hopelessly and irredeemably bad. Mr. Leland himself, when speaking of the manner adopted by some Englishmen, and, as he confesses, by more Americans, in presence of Orientals, speaks very sensibly of the "silly men who cannot conceive the possibility of addressing anybody, high or low, save in a bristly, free and easy, 'funny' way." We are too often tempted to retort that this is just the style in which Mr. Leland likes to address his readers. There is, to our taste at least, no genuine fun in the use of that peculiar slang which has become the staple of would-be American humorists. We are not really amused when Mr. Leland says "as followethly," instead of "as follows"; though it may be regarded as a simple-minded way of hanging out a signal to indicate that he is about to be funny. We even decline to laugh at such fun as is contained in the following sentence:—

If a thing of beauty be a jaw for ever, as the American husband said of his handsome scolding wife, then the donkey boys of Cairo are the most jaw-yous and beautiful creatures on the face of the earth; for the sound of their voices dryeth not up, and wheresoever thou goest they go, and their ways are thy ways, and thy people their people—if they can get hold of them;

and so on to the end of the paragraph. True humorists sometimes make bad puns and are flippant; but bad puns and flippancy are not always truly humorous. The flippancy comes out still more offensively in many of Mr. Leland's pages; and we beg leave to say, once for all (would that we could impress the doctrine upon the regular purveyors of fun for humorous journalism), that it is not really a proof of humour, but, on the contrary, a proof that you can only supply a mechanical substitute for humour, to indulge to excess in burlesque writing. For example, we consider that the following passage is in the worst possible taste, even though Mr. Leland subsequently makes a half apology for his ludicrous treatment of the Jews:—

Alexander Historicus [he says] declares the Egyptians got all they know from the Jews by way of Abraham, who set up an office for fortune-telling in Heliopolis, and gave lessons in astrology to the chief priests; being, I suppose, little cards on which was inscribed, "Predicts marriages, shows the face of your future husband, recovers stolen goods by the planets. Gentlemen, one dollar; second story, back building. N.B.—Ring at the gate."

When a man tries to pass off such dreary facetiousness upon us and expects us to laugh, our impression is simply that he is utterly devoid of any true sense of humour. How else could he expect us to be taken in by his Brummagem substitute for the genuine article, which might be manufactured in lengths according to order? The secret of this literary trick, if it deserves to be called literary, has been made familiar by the scribblers who used to write Comic Blackstones, Comic Histories of England, and travesties of classical authors. The very memory of their ponderous contortions makes us yawn, and, in fact, they resemble nothing but a dull clown who goes through the conventional grimaces, which, having once been produced by people of exuberant animal spirits, are supposed to indicate exuberance of spirits ever afterwards. The adult spectator knows that the poor clown is tired to death of his own pranks, and we cannot doubt that Mr. Leland, when he looks again at his witticism in cold blood, will be astonished that he could ever have mistaken it for genuine fun. It is wonderful how speedily the spirit of a mild joke evaporates when it is committed to paper; and it looks still worse when it is extracted by an unkind reviewer from the pages where it was first made public.

Had Mr. Leland's writing been generally at the level indicated by this stuff about Abraham, we should not have taken any notice of his book. The peculiarity of his case is that, mixed with such twaddle, there is a great deal of writing which shows that he is a man of reading, of intelligence, and even of cultivated taste. For example, the chapter from which we have selected this flower of wit is devoted to a number of legends, recalled to him by Egyptian superstition, as to amatory relations between human beings and spirits. It proves that Mr. Leland has rambled in many bypaths of literature, rarely trodden at the present day, and has studied legendary lore in an intelligent spirit. Unluckily, however, he is in his worst humour throughout the chapter, and thinks that he will make it amusing by such artifices as calling Apollonius of Tyana "old Poll," and imagining him to say to Manippus, "Nip, my boy, don't be in a hurry; that young lady is one of the *Le Muses*."

* *The Egyptian Sketchbook*. By Charles G. Leland. London: Strahan & Co. and Trübner & Co. 1873.

(facetious for lemur), "bad family, my dear fellow, a very bad family." This unseasonable attempt at fun fairly sets our teeth on edge. We can compare it with nothing but some parallel passages in De Quincey, who addresses Josephus, for example, in much the same style. And, in short, we are inclined to say to Mr. Leland, as we should have said to De Quincey, You are a man of talent, and you even possess a vein of humour. But then your humour is not abundant and spontaneous enough to be allowed to flow at this pace. You should treat it more carefully, and use it to lubricate your writings, not to be a substantial part of the dish you set before us. When he is not in such desperate eagerness to be funny, Mr. Leland can not only show that he has read and thought, but he can describe well what he has seen. Innumerable travellers have treated us to pictures of dancing dervishes, of singing girls, and of native marriages; but we do not often find more graphic descriptions than those of Mr. Leland. When he is in his right mind, he is at once a man of culture and a shrewd American. He sees things with his own eyes; he refuses to be prejudiced either by the contempt of the vulgar traveller for all that is strange to him, or by the sentimental colouring which a natural reaction has induced some writer such as "dear old Lady Duff-Gordon" (as he rather offensively describes that lady) to throw over the subject. Indeed he has that kind of obstinate desire to approve of modern civilization even in its vulgar forms which one may not unfrequently observe in the more cultivated Americans. It is a point of patriotism with them to believe in the advantages of railways and telegraphs, even though enlightened taste has shown them the beauty of much of what their rougher countrymen would set down as antiquated lumber. And so Mr. Leland is constantly protesting that it will be better for the people when they have left the *Arabian Nights* further behind them, and he declines, with some recent Liberals, to regard the Eastern Mahomedan as altogether a superior being to the native Christian. At the same time he looks with a kindly eye upon such parts of the Oriental character as commend themselves to his judgment; and talks soundly and sensibly even about Egyptian art, endeavouring with some success to be appreciative without being rhapsodical. In short, but for his occasional freaks of would-be facetiousness, we could accompany him with perfect good temper throughout, and we even admit that his humour, when confined to its natural limits, is agreeable enough. Moreover, we are grateful to him for not insisting upon taking us up the Nile, and for giving us but a very moderate dose of the Sphinx and the Pyramids. He preferred to see more than usual of the people, and especially of the Copts, of whose intelligence and honesty and good temper he speaks in much higher terms than most travellers. Altogether we wish that we could have spoken of him in terms of unmixed eulogy; but, alas! that story about Abraham is one of the things which stir the bile of every reviewer; and indeed criticism would be of little use if it did not aim at repressing such offences against literary good manners.

SIR EDWARD CODRINGTON.*

A LIFE of Admiral Sir Edward Codrington in two bulky volumes may perhaps more than satisfy the demand which undoubtedly exists for biographies of military and naval officers. The subject of these volumes served in three general actions of the French war, and he commanded the combined British, French, and Russian squadrons which transacted the "untoward event" of Navarino. He was born in 1770, went from Harrow School to sea at thirteen, and was nine years a midshipman, during which period he never was invited to open a book, nor received a word of advice or instruction, except professional, from any one. He had the good fortune to be chosen as signal lieutenant to Lord Howe in 1793, and he served on board the *Queen Charlotte* both in the cruise of that year and in the battles of May 29 and June 1, 1794. He has left a very striking picture of the arduous nature of the winter service of the Channel Fleet at that period. The fleet, consisting of between thirty and forty sail of the line, were in constant danger from a succession of S.W. gales of wind and thick weather, cruising between the rocks of Scilly on one side and the French coast on the other. Under these circumstances, and the main object of keeping the sea being over, it was desirable to get the fleet into port. Four days had elapsed since the sun had been visible to enable an observation to be taken to ascertain the latitude, when on the morning of December 10, 1793, a consultation took place between Lord Howe and Sir Roger Curtis (Captain of the Fleet) and Captain Christian as to trying to get the fleet into Torbay. The two latter urged the great danger of the experiment, and the certain loss of the fleet if a mistake were made in making the land. The fears of these two officers would have kept the fleet at sea, but Bowen the master, hearing the conversation, went up to Lord Howe and said abruptly, "My Lord, I can take the fleet safely into Torbay." Lord Howe, after a little consideration, answered, "You shall try it, sir." Both Sir Roger Curtis and Captain Christian pressed on Bowen the impossibility of his knowing exactly where they were, and the probability of his losing the whole fleet in Whitsand Bay. Bowen's answer was, "We shan't make any mistake." This was about 10 A.M. Bowen then directed the course for Start Point. The *Phaeton* frigate,

commanded by that able and excellent seaman, Sir Andrew Douglas, and noted for bearing a press of sail, was directed to keep on the lee bow of the *Queen Charlotte*, as far forward as she could go, without losing sight of her. The *Black Joke* lugger was directed to do the same for the *Phaeton*. In this way the *Queen Charlotte*, under all the sail she could bear, led the fleet, until about 4 o'clock P.M. The *Black Joke* was seen to haul short up on the starboard tack, having run very close to the breakers of the Start, and the *Phaeton* followed her example. The *Queen Charlotte* kept steadily on her course, by which she just cleared the Start Point, so as to keep away for Bury Head; and thus the whole of the fleet, with the exception of two ships, was conducted into a snug anchorage in Torbay. Such confidence and skill was not unusual among Bowen's class, and it was deemed to be handsomely rewarded by promotion, late in life, to a lieutenantancy. This was, in fact, Bowen's reward for "conning" the flag-ship in the battles of the next year.

During the anxious month of May 1794 Codrington, who was long-sighted and much practised in observing signals, was kept almost constantly at the masthead looking out for the French fleet. In conversation Lord Howe had told him that, speaking generally, he would choose to engage the enemy at night, relying on the superior discipline and experience of a British fleet. Codrington asked his lordship whether he would apply that principle in present circumstances. "No," answered Lord Howe, "I require daylight to see how my own captains conduct themselves." In fact, some of these captains did not behave well, and they prevented by their slackness a more complete victory being gained. Almost the only fault of Lord Howe was that he was too easy with those captains; as to whose conduct the lieutenants on the quarter-deck spoke their mind freely, until Lord Howe told Codrington that he desired him to hold his tongue, but did not desire him to shut his eyes. The *Queen Charlotte* passed through the enemy's line. "On going through the smoke," says Codrington, who was on the lower deck, "I hauled up apart, and could just see it was a French ship we were passing, and I successively hauled up the ports and myself fired the whole of my seven weather guns into her; then ran to leeward and fired the lee guns into the other ship." He says also—in reference really to the battle of June 1, but the account is placed under date of May 29—that in passing under the stern of the French flagship *Montagne* he waited at the bow port till he saw the rudder, "the same sea splashing us both, the fly of her ensign brushed our shrouds." The captain of the next gun asked Codrington to fire it, and on his declining, took him up in his arms and carried him, and putting him down at his gun, made him do so. Lord Howe liked close, but not too close, action. He told Bowen that he did not wish the ships to be bilge and bilge, but if he could lock the yard arms, so much the better.

Towards the close of the action of June 1 Lord Howe observed the *Queen* far down to leeward and in danger of being cut off by the enemy. He bade Sir Roger Curtis "Go down to the *Queen*." The answer was, "We can't; we're a mere wreck; the ship won't steer." Bowen burst out with, "She will steer, my Lord," and he made her steer; "watching with a seaman's eye the moment of her falling off, and getting the spritsail well filled to assist her, he got her before the wind with her head to the enemy." This, says Codrington, was her position in the picture, and he gave it himself to the painter. Lord Howe was sixty-nine years of age. He did not go to bed during the whole of the three days' chase, but went to bed completely done up after the action of June 1. Codrington was sent to London by Lord Howe with his despatch announcing the safe arrival of the fleet and six prizes off the Isle of Wight.

In April 1795 Codrington, who had become post-captain, commanded the *Babet* frigate in Lord Bridport's action. The *Queen Charlotte* was then merely a private ship, as Lord Howe was on shore indisposed; but she took the foremost part in the action; and the energetic Bowen, now her first lieutenant, and Sir Andrew Douglas, her captain, doubtless concurred with Codrington in the opinion that Lord Bridport, if he had been rather less cautious, might have captured or destroyed all the French ships, instead of allowing all but three to enter L'Orient. Yet it is difficult to hit the mean between boldness and temerity. After the action the weather became very thick and threatening, with every appearance of a gale or storm. Judging, by the conduct of the ships in charge of prizes, that they were not aware of their situation, Codrington at the close of day ran down and warned them. Afterwards he met Lord Bridport's flag-captain, Domett, at Plymouth, and told him what he had done; and Domett said that he had eased his mind of a heavy load, for when he gave the account of the battle at the Admiralty, he feared that the next news would be, not only that the prizes, but the ships in charge of them, had been lost.

After this commission Codrington was unemployed for some years. In 1802 he married, and when next he went to sea he began a series of letters to his wife which furnish interesting, but almost too copious, material for these volumes. While unemployed he rode a long distance to a ball at Windsor, carrying with him a bouquet which had a very particular destination. Arrived at Windsor he had his hair dressed, having probably to take an early turn of the only available artist or none at all, and he placed his bouquet in water and sat down in an armchair to await the time of going to the ball. Of course he had nothing to do, but nobody had anything to do, or expected to have anything to do, in those days. Unfortunately he fell asleep, and when he awoke it was broad daylight, the flowers were blooming sweetly on the table, and the ball was over. In May 1805 Captain Codrington

* *Memoir of the Life of Admiral Sir Edward Codrington; with Selections from his Public and Private Correspondence.* Edited by his Daughter, Lady Bouchier. 2 vols. London: Longmans. 1873.

ton was appointed to the *Orion* of 74 guns, and proceeded to the Mediterranean, where Collingwood, and afterwards Nelson, commanded the fleet. He calls Collingwood a "stay-on-board admiral," who never communicated with anybody but on service, and he regretted the departure of Sir Robert Calder, who was fond of asking people to dinner. Soon afterwards he writes, "Lord Nelson is arrived. A sort of general joy has been the consequence." He handed to Codrington a letter from his wife, and said that, being entrusted with it by a lady, he made a point of delivering it himself. On September 30 Codrington writes, "The signal was made this morning for all of us who did not dine on board the *Victory* yesterday to go there to-day. What our late chief will think of this I don't know; but I well know what the fleet think of the difference; and even you, our good wives, who have some causes of disapprobation, will allow the superiority of Lord Nelson in all those social arrangements which bind his captains to their admiral." Speaking of Calder's action and the clamour that arose against him, he says, "Had he written well, they would have made it a great victory." The Admiralty ordered Calder home in a frigate, but Lord Nelson, "like an officer and a gentleman," gave him his own flag-ship, although he thus reduced his own fighting strength. The great battle was now close at hand, and everybody was in good humour with their chief. "Lord Nelson had just hoisted his dinner flag to several captains at nine o'clock this morning" (19th October), "when, to my great astonishment, he wore ship and made the signal for a general chase to windward." The *Orion* came rather late into the battle of the 21st, but Codrington justified his reputation as a skilful officer by his handling of her. He made his men reserve their fire until it could be effectual, and the captain of a ship which he passed near hailed him, and "hoped he would make a better flat of it" than another ship which was also near. He says that the battle was nothing to the fatigue, anxiety, and distress of mind which succeeded, particularly in such horrible weather as they encountered. He had 500 prisoners on board, and 120 men of other ships, besides his own crew, so that he victualled close upon 1,200 men. He shows in various ways his dislike of Collingwood, and grumbles at the dull blockading days which followed Trafalgar, when the only relief was a social dinner of captains, following a court-martial. Speaking of Sir Samuel Hood, who had lost his arm, he says that Nelson without his arm was worth all our other admirals, and he hopes Hood may imitate him. But Nelson only rose to eminence by an exclusive devotion to his profession which Codrington did not desire to imitate:—

Putting his great abilities, his unremitting attention and employment in the service, and the much greater experience he had had long before he was my age, quite out of the question, so-called honour, glory, and distinction were the sole objects of his life, and that dear domestic happiness—my only boon—never abstracted his attention.

Nelson had not, or did not acknowledge, any incumbrances; and his rule was that "every man became a bachelor after he passed the Rock of Gibraltar." Mrs. Codrington was doubtless content that her husband should not become a Nelson on these terms. But indeed Nelson's work was done, and henceforth the contest with Napoleon was to be waged on land, where Nelson could not serve his country. Amid the mud of Walcheren, which was neither land nor water, even Nelson could not have done much good. Codrington returned from the Mediterranean, paid off the *Orion*, and commanded the *Blake* at Walcheren, where he had the largest part of the little fighting that there was. His letters to his wife give a vivid picture of the imbecility of the combined action of a fleet and army which, separate, could win Trafalgar and Waterloo. He was afterwards employed in the *Blake* on the coast of Spain, co-operating with our army and the Spaniards. His ship being paid off in 1813, he remained for rather more than a year on shore. In May 1814 Lord Cochrane, who was to have sailed in the *Tonnant* as flag-captain to his uncle Admiral Sir Alexander Cochrane, became involved in a charge of Stock Exchange fraud, and Codrington was appointed in his place. Thus he bore an active part in the war with the United States, and was present at the disastrous attack on New Orleans. "By exertion which is beyond belief," he and the seamen placed Colonel Thornton in a position to make a flank attack which succeeded. But in the meanwhile the main attack had been made and failed. Like other competent observers, he thought that success under good management was possible, and he censured our generals for rash exposure of their own lives. After the peace he remained on shore until 1827, when he hoisted his flag as Commander-in-Chief in the Mediterranean. The diplomatic complications which deprived him of the well-earned honour of Navarino cannot be unravelled at the close of an article, but they deserve attention.

YONGE'S THREE CENTURIES OF MODERN HISTORY.

THERE is, we think, some ground for fearing that "the youthful student," for whose benefit the work before us is designed, may on perusal begin to question the assertion in the first page that "there can be no more interesting study than that of History." Undoubtedly the three centuries from the invasion of Italy by Charles VIII. of France to the overthrow of Napoleon are not dull or uneventful times; it is the style rather than the sub-

ject-matter that is at fault. The author's love for sentences of inordinate length has already been remarked upon, and we need only add that it has not diminished. Every now and then his pen fairly runs away with him, leaving the reader to toil after him through the turns and winds of some sixteen or twenty lines, and bewilder himself amid a maze of pronouns. Take the following sentence, not by any means one of the longest, as a specimen:—

Not only did Henry of England enter the lists against him [Luther] as an author, and thus apparently bind himself, as it were, by his own vanity, for ever to the maintenance of the old belief and practice; while Francis, in the very same year in which he disowned the Pope at Wittenburg [sic], committed more than one of his parliamentarians to the flames; but the supreme authority in his own country, Charles, in his newly acquired character of Emperor of Germany, convened a Diet of the Empire at Worms in the summer of the next year, 1521, which, when he refused to retract his opinions, published a sentence of outlawry against him, and offered a large reward for his arrest, which would unquestionably have been followed by his instant execution.

The youthful student may be pardoned if he understands this passage to convey a charge against the Most Christian King that not only did he disown the Pope at Wittenburg, but that he even carried his audacity the length of burning more than one Papist. It may further be gathered that Charles was called upon to retract his opinions before the Diet which he had himself convened, and that his refusal exposed him to the risk of meeting the fate afterwards incurred by his namesake of England, and dying by the hands of the executioner. Not that the author is by any means indifferent to the charms and graces of style. He loves to enliven his narrative with small quotations from ancient or modern poets. Thus, having occasion to mention that fortune baffled somebody's schemes in a particularly provoking manner, he takes the trouble to append a footnote for the purpose of quoting

Fortuna, sævo læta negotio, et
Ludum insolentem ludere pertinax,

together with its translation by Dryden. It is rather hard upon a conscientious student who is trying to master the intricacies of the Spanish Partition treaties to call off his attention to a not very apposite classical quotation, which, instead of throwing any fresh light on the matter in hand, only informs him that Fortune is of a malignant and perverse disposition. The retreat from Moscow, we are told, was "the greatest disaster which ever befel the commander of an army, since a single ship, the sole relic of the host which he had led to Salamis, bore Xerxes back to the Hellespont"; and another footnote is devoted to an appropriate quotation from Juvenal and its translation. The "Spanish Fury" at Antwerp gives an opportunity for introducing the sack of Troy, as described by Virgil, together with the following comment:—

But, furious as was Neoptolemus, avenging the death of his sire, and fierce as were his followers (as men might well be who believed that some of their gods delighted in slaughter), no heathen warriors ever perpetrated, nor did any heathen poet ever conceive, such savage barbarities as the Spaniards now inflicted on the very citizens whom they had been appointed to defend.

Charles V. is paralleled with Diocletian, and Diocletian, as a man given to gardening, is again likened to the old Corycian on the banks of the Calesus, and the footnote with its quotation follows. Happily at this point the author is content, and does not go on to liken the old Corycian to anybody else. English literature is, we need not say, also familiar to Professor Yonge. Of *Alva* we are told that few could fathom his "remorseless ferocity," and this Byronic phrase serves to usher in the four lines of the *Corsair* beginning "There was a laughing devil in his sneer." The blood-tinged draught of water which a soldier brings in his helmet to King Francis I. of France, athirst with his exertions in the first day's fight of Marignano, suggests four lines from the closing scene of *Marmion*:—

She stooped her by the runnel's side,
But in abhorrence backward drew; &c.

When Marie Antoinette stands firm before a revolutionary mob, we are told that they quailed before

Her lion-port, her awe-commanding face;

and the author does not seem conscious of the incongruity of the implied comparison with Queen Elizabeth at the height of her power. It would be easy to fit almost every event in history with quotations from ancient and modern poets at least as appropriate as many of these.

The same character of—shall we say, priggishness?—which shows itself in these poetical ornaments runs throughout the book. We sympathize with the Professor in his antipathy to those representatives of the ancient glories of France, Francis I. and Louis XIV., and have no desire to undertake their defence against him. But all the same we could wish that he was briefer in expressing his disapprobation, and that he would not say the same things twice over. King John of France and his fine sentiment, authentic or the reverse, that if truth were banished from the rest of the world, it ought ever to find a home in the bosoms of princes, do duty first in contrast with the bad faith of Francis I. and then with that of Louis XIV. With the last-named monarch the writer deals—to borrow a simile from Scott's wicked Lord Etherington—"as a boy does with the first hare he shoots, which he never thinks dead till he has fired the second barrel into her." After giving a death-wound to Louis's dignity by roundly calling him "a notorious coward," it is superfluous to deliver a second shot by describing him, many pages later, as "so far from being animated with the spirit of chivalrous enterprise, that he was devoid even of

* *Three Centuries of Modern History*. By Charles Duke Yonge, Regius Professor of Modern History and English Literature in Queen's College, Belfast; Author of "A School History of England," "Three Centuries of English Literature," &c. London: Longmans & Co.

that animal courage which is an especial attribute of his countrymen in general." When it has once been said that a man is a notorious thief, there is nothing gained by adding that he is so far from being animated by a high sense of duty that he is devoid even of common honesty. In one place we are informed that "for many years Louis had scandalized the world with a greater shamelessness of profligacy than even the most licentious of his predecessors"; in another, that "in his private life he was profligate and licentious beyond even the foulest traditions of his ancestors." As Henry IV. has already been characterized as "dissolute and licentious even beyond the example of the most profligate of his predecessors," and Francis I. had already set his people "a constant example of the most scandalous licentiousness such as had never before been witnessed on a throne," one desires a little more variation of phrase and idea. The abuse heaped upon Francis runs at last into exaggeration:—

It was his conduct [says the author], shameless alike in falsehood, in profligacy, and barbarity, vices not to be atoned for by picking up Leonardo da Vinci's paint-brush, or by inviting Erasmus to preside over a college which was never founded, his open derision of all restraint, of all decency, of everything that had ever been held honourable or respectable among men, that first sowed the seeds of that general demoralization of the whole French people of which they are to this day reaping the bitter fruit.

It may be noted that Louise of Savoy, the mother of Francis, has already been charged with corrupting the French Court, whose evil example "bred that universal demoralization which developed itself in the horrors of the first Revolution, and of which the nation is still reaping the bitter fruit"; and later on we find that to the example set by Louis XIV. "is to be traced the steady growth of gambling, extravagance, licentiousness, and shamelessness continuing and inflaming the demoralization of the whole people which had been so long in progress." Nay, the author is so impressed with the baneful influence of Louis that he returns to the charge, and again taxes him with "accelerating the demoralization of all classes, which had indeed been long at work, but which had never proceeded with such giant strides as during this reign." After all has been said, there will remain the question whether a king demoralizes his people or they demoralize him. However, to return to Francis and his share in this ever-increasing demoralization—as to restraint and decency, there is not a word to be said for him; but we doubt whether he can with justice be accused of openly deriding everything that had ever been held in honour and respect. Religion would come under this head, and Francis, despite his relations with the Turks, was not a scoffer or a blasphemer, being indeed a devout person after his fashion. Courage and honour are likewise held in respect among men, and Francis was a gallant knight, as far as fighting went; and though good faith was not his strong point, he could at least asseverate *par le feu de gentilhomme* with an air and a grace, and resent an imputation upon his honour. He was in short a tinsel hero, but he at any rate set up for a hero.

About the intellectual character of Louis XIV. the author is not quite so certain as he is about the moral; for in one place he lays down that Louis "was scantily endowed by nature," and appends a note giving his authority—St. Simon—for this opinion, and intimating that Macaulay over-rated the Great King's statesmanship; while later on he is so far mollified as to say, "It may be admitted that he was endowed by nature with fair abilities." As a general rule, however, there is about the author no lack of decision. Junius and the Man in the Iron Mask have alike ceased to be mysteries for him. "He who doubts that Francis was the one, and Matthioli the other, may equally be pronounced incapable of estimating evidence." Necker is "imbecile"; Lafayette is either imbecile or treacherous or both, "utterly devoid of any sort of ability, civil or military," and "as incapable as he was disloyal." The account of the French Revolution is indeed written on the Royalist side, and avowedly dwells chiefly upon the fortunes of the King, as might be expected from a writer who speaks of our own Civil Wars by the old Royalist name of the "great English Rebellion."

We note an obscurity, if not an inaccuracy, with regard to the period of Voltaire's visit to England. The author says that Voltaire was thrown into prison on a charge of having published a satire against the late King Louis XIV., adding, some sentences later, that "after he was released from the Bastille he visited England." Now the release here intended was from a second imprisonment, the result of his quarrel with the Chevalier de Rohan. As the author, by confusing the two imprisonments, cuts eight years out of Voltaire's life, so in his account of the sack of Rome in 1527 he sends Philibert of Châlons, Prince of Orange, to the shades full three years before his time. After recounting the fall of the Constable Bourbon and the storming of the city, he says, "Before evening Philibert, Prince of Orange, assumed the command; but he, too, was killed in some of the subsequent operations, and, even while he lived, he was utterly unable to curb the ferocious lawlessness of his soldiers"; and the narrative then goes on to describe the prolonged horrors of the sack and occupation of Rome. Now Philibert, so far from being killed at Rome, lived to lead the remnant of his army out of the city, making that successful retreat to Naples commemorated by Brantôme in the *Belles retraites d'Armées*. Professor Yonge reckons Brantôme, Guicciardini, and Robertson among his authorities, and from any of them he might have learnt that it was during the siege of Florence in 1530, that Philibert fell, while combating valiantly, in hopes, according to Brantôme, to win his promised bride, Catharine de' Medici. Neither is Professor Yonge accurate in his statement that "as

early as 1525 a woolcomber of Meaux, named Jean de Clere, was burnt alive for breaking an image of the Virgin in that city." Le Clere had already won the honours of a confessor at Meaux; but it was at Metz, whither he had retired from France, that his zeal led him to make that violent protest against image-worship for which he was tortured and burnt.

We will wind up by quoting Professor Yonge's view on the uses of history. Not only is it an interesting study, even if regarded merely as an intellectual employment, but,

if considered with a view to its practical usefulness as the great lesson-book of statesmen, it can hardly be superfluous occasionally to remind its students that nations cannot stand alone any more than individuals; that, like individuals, they too have responsibilities; that in them also misconduct in one age is nearly sure to entail suffering in another, and that the most magnanimous, humane, and unselfish policy towards others is the wisest, not only for their reputation, but for their material interests.

It is well that a book intended for young people should inculcate good moral sentiments; but the studious statesman may perhaps ask what nation has pursued a "magnanimous, humane, and unselfish policy" with sufficient persistence to enable him to form any conclusion as to its effect.

ILLUSTRATIONS OF CHINA AND ITS PEOPLE.*

IN the present volume Mr. Thomson takes up his parable from the point at which he left us in the previous part (see *Saturday Review*, July 19, 1873), and launches us at once among the bamboos, the semi-civilized tribes, and the mountain scenery of Formosa. Belonging to China, and yet not by any means entirely Chinese, this island presents many points of interest. In the year 1634 it was taken possession of by the Dutch, who held it until 1661, when it was snatched from their grasp by the Chinese General Koxinga. Since that time Chinese colonists have established themselves at every available spot round the coast, driving the aborigines slowly back into the forests and fastnesses of the mountains. Of four out of the five tribes which now occupy the highlands we know but little, except that in many cases they have proved themselves to be wreckers of the worst description, and that they live in a chronic state of rebellion against their foreign masters. News recently brought from China informs us that an expedition is about to be sent to the island to punish the natives of a certain district for the brutal murder of a shipwrecked crew of Loochoons who were cast by a tempest on their inhospitable shore; and if this correction should be judiciously administered, it may possibly be the means of saving the life of many a half-drowned sailor, who, as matters now stand, had far better yield himself a victim to the fury of the typhoon than struggle into the relentless grasp of the Formosans. One tribe only, the Papohans, or "Foreigners of the Plain," are on terms of intimacy and friendship with the Chinese. They submit to their authority, and are linked with them by ties of commerce, and often of blood. They imitate their dress, and affect to despise their highland brethren in virtue of their traditional descent from the original Dutch settlers on the island. Their claim to this superiority, as far as it has yet been investigated, appears to rest on a very slight foundation, and to be based principally on the possession of some old coats which they profess to have inherited from their forefathers, and of some manuscripts which have no real pretensions to authenticity. In appearance they bear no trace of European blood, but in a most marked manner resemble the Malays. The form and colour of their eyes, their general figure, and the dialect they speak all point to this affinity of race. A comparison between the photographs Nos. 9-12 and Nos. 20-25 in Mr. Thomson's present volume will at least show at a glance the wide gulf which separates them from the Chinese and Tatar races. Mr. Thomson is of opinion that they are also allied to the Burmese, the Laos, and the Shans; and some of their customs as described by recent travellers certainly help to bear out this idea, at least as far as the Laos and Shans are concerned. For instance, in the matter of marriage, both in Formosa and in some parts of Burmah, the husband for a given time has no recognized claim to his wife's society, and only visits her at her father's house by stealth at night, escaping by the window at dawn of day. The *al fresco* feasts and merry-makings also of these peoples are almost identical.

From Formosa Mr. Thomson takes us to Swatow and the neighbouring city of Chao-chow Fu, both places where some few years ago much hostility was shown to foreigners. The clause in the treaty giving our Consul right of entry into Chao-chow Fu was for years a dead letter, and our merchants and sailors seldom ventured far beyond the confines of the settlement at Swatow without being either attacked or insulted. For these, as for many other evils which have afflicted us in the South of China, the Coolie traffic is mainly answerable; and when we recollect the atrocities committed by the kidnappers, the desolated homes, the violence used in the capture, sometimes even amounting to murder, the cruelties practised in the barracoons and on the voyage, and the horrors of the slavery which awaited the sufferers on arriving in distant lands, we stand astonished at the moderation of the villagers at a time when they were too ignorant to recognize any distinction between the swartly scoundrels who prowled about their bays and rivers intent on evil, and the hundreds of men of honour and fairer complexion whose lot was cast among

* *Illustrations of China and its People: a Series of Two Hundred Photographs, with Letterpress descriptive of the Places and People represented.* By J. Thomson, F.R.G.S. 4 vols. Vol. 2. London: Sampson Low & Co. 1873.

them. Time having enlightened them on this as on other subjects, and public opinion in Europe having been strong enough to put a check on the kidnapper's trade, the relations between the foreign residents and the natives have much improved. Mr. Thomson found the inhabitants civil and obliging until he aroused their superstitious fears by attempting to photograph the quaint old city bridge, which, like old London Bridge, is lined with shops and places of business:—

When taking the illustration [he tells us] I endeavoured to avoid the crowd by starting to work at daylight; but the people were astir, and seeing my strange instrument pointed cannonwise towards their shanty dwellings, they at once decided that I was practising some outlandish witchcraft against the old bridge and its inhabitants. The market stalls were abandoned, and for aught I know the shops were shut, that the barbarian who had come to brew mischief for them all might be properly pelted. The roughs and market people came heart and soul to the task, armed with mud and missiles which were soon flying in a shower about my head. I made a plunge for the boat, which was fortunately close at hand, and, once on board, it told to my advantage, when I charged a ruffian with the pointed tripod as he attempted to stop my progress. My camera lost its cap, and received a black eye of mud in exchange. For myself I sustained but little damage, while it may fairly be said that the bridge was taken at the point of the tripod.

The views Mr. Thomson gives us of Amoy—the first port in China visited by foreigners—and of Foochow, are well chosen, and present us with the leading characteristics of each place. In Plate XVII. we have a specimen of the splendid scenery which borders on the river Min. The Buddhist priests in China appear to have a very keen appreciation of the beauties of nature. Unlike their secular brethren, who invariably build their dwellings on low ground, the priests, whenever it is possible, plant their monasteries high up among the hills, and delight to choose for their sites the spots where the rocks and glens are toned down by the luxuriance of almost tropical foliage. The founder of the Yuenfu monastery, in the neighbourhood of Foochow, has been more than ordinarily happy in his choice of a site. Perched in a cavern which has been formed by the fall of a great mass of rock into the ravine beneath, where it has been overgrown with trees probably centuries old, this monastery commands a view which for richness and variety can scarcely be surpassed. The pathway leading up to it, long and precipitous, passes through a natural tunnel under the fallen rock, and higher up twists and turns through a rocky chasm roofed over with gigantic ferns. The relief of exchanging the heat of the plains for such a cool and refreshing retreat can easily be imagined, and we are not surprised to hear that troops of pilgrims weary with their importunities for lodgings the three priests who are possessed of this goodly inheritance. Very different is the aspect of the Franco-Chinese arsenal at Foochow. The long, low, ugly buildings, the tall chimneys vomiting forth smoke, the steam-pipes, and the tramways, are all so many signs of the presence of the practical, businesslike foreigner, and of the desire of the Chinese authorities to possess themselves of certain of the applied sciences of Europe. The arsenal was established in 1867 by M. Giquel, a French naval officer, and the success he has attained is a fitting commentary on his fitness and ability for the work. Already three or four large steam transports carrying guns, and as many gunboats, have been successfully built and launched. Three hundred young Chinamen are in daily attendance at the schools of nautical and mathematical science, and fifteen hundred artisans are employed upon the works, under the superintendence of between fifty and sixty foreign employes, most of whom are French. Mr. Thomson visited the arsenal in 1870, and thus describes what he saw:—

In front of the engineering shops there was a tramway, and trucks to facilitate the transit of materials and work from one shop to another. These workshops were fitted up with every modern appliance; great steam hammers, planing and drilling machines, and lathes of every variety. I felt most interested in the optical department, where the men were engaged in constructing portions of chronometers, ships' compasses and telescopes. Some were busy at brass work, and others at grinding and polishing lenses. They had not, however, got to the length of making the achromatic object-glasses used for telescopes; but nevertheless they were doing work which took me by surprise. In front of the arsenal there was a patent slip for raising vessels broadside on to be repaired. This slip is capable of lifting ships of 3,000 tons. The monthly expenditure at this arsenal is reported to be about 17,000*l.*

Similar institutions under English or French superintendence have been established at Tientsin, Shanghai, and Nanking, and one result of the improved condition of the army arising therefrom may be seen in the ease with which, in the recent campaign in Yunnan, the Imperial forces crushed the Mahomedan rebellion, which for fifteen years had defied all the armies of the Empire.

In common with all Eastern countries, the cities of China abound with beggars, who pursue their calling with the assurance of men occupying a recognized position. The law, far from making any attempt to suppress them, affords them a quasi-protection, and allows them to expose their filth and deformities in the streets, to shout and yell for alms, and to levy black-mail on the householders, without lifting even so much as a finger against them. On the Trade Union principle they find it to the advantage of their class to act in a compact body; and in every town in China, therefore, they have established regularly organized societies, with a chief, subordinate officers, and a recognized code of laws. Combining the functions of a parish surveyor with those of the chairman of a Trade Union, each chief assesses the rate to be paid to himself by every householder in the district over which he has control, and woe to the unhappy wight who dares to refuse to contribute his quota. Mr. Thomson mentions a case where a silk merchant was foolhardy enough to object

to pay his rate, upon which a member of the fraternity was sent to his shop having his body smeared over with mud, and bearing in his hand a bowl slung with cords, and filled to the brim with foul water. Thus armed, he began to swing the bowl round his head without spilling a drop of its contents; but had any one attempted to stay his hand, the water would have been distributed in a filthy shower over the silks and satins piled upon the shelves and counter. The demonstration had the desired effect, and the rate was thenceforth paid with due regularity. The incomes derived in this way by the beggar chiefs are often considerable; and in Photograph No. 53 Mr. Thomson gives us a portrait of one of these gentlemen, dressed in the height of fashion, in strange contrast to two of his miserable slaves, whom he seems to be admonishing.

One great charm in the present as in the former volume is the great variety of subjects chosen for illustration. Every kind of scenery, from the rough rocks off the Amoy harbour to a most exquisitely pretty corner of a bamboo grove, which ornaments the opening page, is to be found; while portraits of men, women, and children of all ages, and of every condition of life, are scattered throughout the pages. The photographs themselves are excellent, and we observe that Mr. Thomson has given us twelve more than the number originally announced.

SHE AND I.*

WE believe it is sound philosophy to suppose that everything has its "reason why"; but it is difficult to understand the exact meaning of certain odd growths and developments; and among them the aim or purpose of such a book as *She and I* is one. We are sincerely sorry for the ill luck that pursued Mr. Frank Lorton, who tells his own story. We wish for his sake that his beloved "Min" had lived to become Mrs. Frank Lorton, and the comfortable mother of many little Lortons; and we have no doubt it was a severe shock to him when he came home from America expecting to make her his wife, to find that she had died of a cold only the week before; but why need he tell all this to the world in two volumes of bad English? The legitimate reason why a novel should be written at all is to amuse; the illegitimate, to instruct. Still this latter, if out of the absolutely right line, has a line of its kind; but *She and I* neither amuses nor instructs, and is thus without a *raison d'être* of even the second degree, unless we allow for "the good of trade" and the employment of our friend the British workman.

We have often had occasion to speak severely of some of our lady authors; but we do not know the weakest sister among them who could have put forth such miserable slipslop as this feeble book. Method, manner, dramatic action, and artistic presentation—it fails in all alike. It has no plot in the gradual unravelling of which our curiosity is excited; no vividness of personation to call out our sympathies or admiration; the story is a mere thimbleful of dust out of which Mr. Hutcherson has imagined he has constructed a statue; and though the title is a plagiarism, unfortunately the characters are not. Had they been drawn from any other author's *répertoire* they might have had a chance of looking like flesh and blood. As it is, they get no nearer humanity than the men and women of the barber's window and the milliner's fashion-book.

Of Mr. Frank Lorton himself we have only the haziest kind of idea. We learn that when he offers himself to Mrs. Clyde as the husband of her peerless "Min," the pet name of Minnie, he is three-and-twenty, but looks younger; that he has two hundred and fifty pounds a year without working, and that his work "on the press" is not of a kind to count for much more. We learn, too, that he lives in a London suburb given up to lawns and market-gardens; that he goes to church like a good boy, though he does not always employ his time profitably when he is there—witness his frantic falling in love with his unknown goddess "at sight"—and that he admires poetry, and has bad manners and a worse temper. More than this we cannot grasp, save the fact, patent to every reader of *She and I*, that he has not mastered the first rules of composition, and that he evidently believes in himself more than we imagine he will find the public ready to do. Of his style a few phrases will suffice as bricks from his Babylon. He is given to the curt, spasmodic, ejaculatory method. "Dear old church!" "Can I?" "I will!" "It was quite vexatious." "It was now full." "I trembled in my boots." These are only a few of the startling single lines which break up the longer paragraphs; while certain of the passages are in this style:—"Which way did we go?" "Can you not guess, or must I have to tell?" "How very obtuse some persons are!" The "you" here is the reader; and a little lower down the page the author still further molests that unfortunate person, when, after telling him how he went up the steps and spoke to "Min," he turns round on him with the taunt, "You would have proceeded on your way with a passing bow! Oh! yes!" This is an exceedingly favourite method of expressing his feelings with Mr. Frank Lorton. Kind old Miss Pinpernell invites him to tea, to meet among other friends *Miss Clyde*, underlined—the "Min" in question—"if that would be any further inducement for me." On which he breaks out with "Oh Miss Pinpernell, you Macchiavellian old lady! I would not have thought you could have practised such great dissimulation—would Min's presence be any further

* *She and I: a Love Story; a Life History.* By John C. Hutcherson, 2 vols. London: Bentley & Son. 1873.

inducement to me! Wouldn't it? Oh dear no; certainly not." Are we indiscreet in asking where are Mr. Hutcheson's friends?

If the style of this book is odd, the incidents and characters follow suit. We have said that Mr. Lorton began his love affair in church, rushing down the incline at such headlong speed that by the time service is over, and he has offered to restore to his St. Cecilia a piece of mignonette she has left on the seat, and she has smiled, shaken her head, and refused, he is able to say, "My fate was sealed; and as the organ pealed forth the grand prayer from *Mosè in Egitto* for the exodus of the congregation, and I slowly passed down the aisle after my enchantress, my soul expanded into a very heaven of adoration and love!" In the churchyard he loses his goddess with the grey eyes and dimpled chin; on which he addresses himself to one Mr. Horner—"Jack Horner" to his friends—a ridiculous effigy intended to personate a Government clerk, whose income is spent on smart attire, and whose Sunday delight it is to leave the church "immediately after the doxology," and who, "planting himself easily and gracefully in a studied attitude some short distance from the doors, would, from that commanding position, proceed to stare at and minutely observe the congregation, collectively and severally, as they came tripping forth from the porch after him." The "ladies in half mourning," however, are not to be found; and Frank Lorton remains constant in love, miserable, and more imbecile than usual, until the winter. And then, in the week before Christmas, as he is in the school-room helping in the preparations for the Christmas decorations, his "lost Madonna" comes in with a "scarlet and white sontag, of soft wool knitting, crossed over her bosom, and clasped round her dainty, dainty waist." We confess that we ought to be omniscient, and to own to ignorance is to put a whip into the hands of our enemies; but which of the many devices in soft wool knitting which women cross over their bosoms and clasp round their dainty, dainty waists is that particular device called a sontag? Has Mr. Hutcheson been undergoing a course of *Le Follet* or the *Queen* before he wrote this wonderfully silly book?

When the business part of the meeting is over, they all have a game at blind-man's-buff in the school-room, the vicar and his elderly maiden sister, Miss Pimpernell, joining; and then Frank Lorton conducts the Madonna to her house. Because of these church decorations the young people meet every evening for a week; and at the end of that time, on Christmas Day, Frank takes "Min" a bunch of violets, and says, "Good-bye, my darling." After which he goes home "as joyous as a bird and as hungry as a hunter," and takes occasion to assure the reader that "happy lovers are always hungry, and have great appetites." So it seems have happy lovers' dogs; for Frank's dog Catch, whom "Min" has just said she "loved," as she "loved" violets, "galloped into his oatmeal porridge after his walk," or rather "the oatmeal porridge galloped into him" in a way to make the young gentleman, his master, exclaim to the reader, "You should have only seen him, that's all!" On their next meeting these innocent young people call each other "Min" and "Frank," though all this time neither Mrs. Clyde nor the old Lortons have had a word to say to the acquaintance. But presently Frank is introduced to Mrs. Clyde, and asked to her house on a certain Wednesday evening. As he is going, he is attacked by a "singular sensation of nervousness, shyness—'mauvaise honte'—just as if a cold key had been put down my back," and when he arrives at the house the cold key process is complete; for he is the first of the guests, and Mrs. Clyde is disgusted. During the evening he shows his temper, and acts in a manner which would have justified Mr. Jack Horner, or Mr. Mawley the curate, or any able-bodied young man in the room, in ejecting him summarily from the premises. But "Min" only coaxes him with "Frank!" and bewitching smiles, which, however, fail in producing any good effect, and he remains to the end the insolent young animal Mr. Hutcheson has depicted, apparently under the impression that he was painting a character and manners possible in rational society.

The next day, to make up for his boorishness, Mr. Lorton takes Miss Clyde a certain bullfinch, by name Dicky Chips, "the funniest, quaintest, most intelligent, and most amusing little bullfinch you ever clapped eyes on." He begins the interview by an apology for his rudeness last night; to which she answers, "What made you so naughty, sir?"—this is to be read playfully, not formally—with "a dancing light in the clear gray eyes, and a smile on her pretty little mouth." After which they go on with "Frank" and "Min," and silvery laughs and more confessions, till he "pulls the little chap, cage and all," out of his pocket, and gives her Dicky Chips:—

"Oh, Frank!" she exclaimed, in her sweet, earnest accents, with a ring of emotion in them. "He's such a little pet of yours; and you have had him so long! I would not take him from you for the world!"

"Then," said I, just as earnestly, "you have not forgiven me. Oh, Min! when you promised to do so!" And I took up my hat as if to go away.

We argued the point; but, the end of the matter was, that Dicky Chips was made over to his new mistress, with all his goods, chattels, and appurtenances. A happy bird he might consider himself henceforth, I knew. He would be idolised—a very nice situation, indeed, for a bullfinch!

By-and-by I got closer to Min, as we were standing up, talking together and making Dicky go through a few of his tricks on the drawing-room table.

"Min," said I, softly, bending over her and looking down into her honest, truth-telling gray eyes—"my darling!"

But, at that precise moment, the door opened; and, in walked Mrs. Clyde.

The next chapter is headed "Breakers Ahead," and Mr. Tennyson has to answer for the motto:—

Oh, I see thee, old and formal, fitted to thy petty part,
With a little board of maxims preaching down a daughter's heart.

"They were dangerous guides the feelings—she herself was not exempt—Truly she herself had suffered"—perish in thy self-contempt!

But really we think our author is somewhat hard on that well-abused person, the mother who interests herself in her daughter's marriage. Unless it is to be understood that the mere fact of love between two impecunious young people, devoid of experience, sense, and means in about equal proportion, is sufficient basis on which to construct a marriage, we cannot see what a mother has to do but to "break down her daughter's heart" when she has given it in defiance of the rules of rational living. Blisses and kisses make a rhyme that comes only too easily, and love in a cottage has been painted with many a "juicy" brush; but there always remains that one stern prosaic fact of the circulating medium, and even idiotic lovers and Madonnas with gray eyes have to be fed. There are few things so utterly insignificant as to be unable to do harm. *She and I* is about one of the most insignificant of its tribe—the absolutely worthless novel; but still it has its little poison-bag like other weak, small creatures. Girls are generally silly enough by nature; and when they are in love they are at their silliest. Anything, then, which helps them to withstand the rational advice of their friends, and gives their folly an extra strain, is decidedly pernicious; and Mr. Hutcheson's diatribes against Mrs. Clyde—representing reason and common sense—are mischievous just so far as this. On the whole, such a book as *She and I* can only be regarded as a weed to be dug up and carted away out of the field as soon as possible. Common sense, reason, and good grammar need their "Index Expurgatorius" as much as Roman Catholicism.

FRENCH LITERATURE.

BEFORE the fine weather disappears completely and the travelling season may be said to have come to an end, let us notice a few volumes belonging to M. Ad. Joanne's excellent collection of Guides. Of course the International Exhibition at Vienna gives particular interest to the tiny but elegant duodecimo lately included amongst the *Guides-diamant*.* The whole route from Paris to the capital of the Austrian Empire is accurately described; all places which deserve the notice of tourists are made the subject of distinct paragraphs, and the letterpress is illustrated by numerous woodcuts, maps, and plans.

In the case of a country like Italy, so full of historical recollections and of artistic and natural beauties, it is obvious that the three hundred and ninety-two pages of the *Guide-diamant*† cannot take the place of a more detailed handbook. At the same time it will be found extremely useful as a remembrancer, and it brings together in a pithy and concise manner subjects which the traveller will be able to muster more in detail when leisure allows him to do so. M. du Pays, who is the writer of the Italian part of M. Joanne's series, has greatly facilitated the labours of tourists by giving them sketches of excursions so contrived that in a very short time they can explore systematically and usefully all the places of note throughout the Peninsula.

M. Joanne himself has taken under his special care the volume referring to France.‡ Notwithstanding its brevity, this little book is a model of completeness; and although we must not look to it for picturesque descriptions and detailed archaeological notices, it leaves nothing unmentioned which deserves to be intelligently and carefully studied.

The volume which M. Isambert has devoted to the East § is of greater pretensions; the route which it embraces covers a large tract of country, for it includes not only Turkey in Europe and Greece, but the Danubian provinces, Albania, Servia, and even the plains of Troy. Our author begins by a few practical directions to tourists, such as hints about the clothes they should wear, the hygienic precautions they should take, the cheapest way of travelling, &c. The first part of the book is taken up by Greece, and we doubt whether a better description of that country has ever been written in so few pages. Not only does M. Isambert sketch the geography of Greece, and give a summary of its political history; he also enters into details concerning the development of the fine arts from the classical period to the Byzantine age; he then speaks of the government of the country as it is carried on at present, and describes the formation and character of modern Greek. The part of the volume treating of Turkey introduces us to a society with which the majority of readers are as yet very little acquainted. The Turkish vocabulary, consisting of expressions likely to be constantly used by tourists, is an excellent feature in this publication; but what must we think of our old friend Covielle's rash statement that *la langue turque dit beaucoup de choses en peu de mots*, when we find the following sentence given as the equivalent of "Please remember the waiter":—"Kizimdim itchin bir chei kirem edin"! Eleven maps and twenty-three plans complete the volume.

The materials accumulated by generations of scholars and enthusiasts have been carefully gathered together, elaborated, and presented in a readable form by M. E. Despois in his new edition

* *Guides-diamant. De Paris à Vienne.* Paris and London: Hachette & Co.

† *Guides-diamant. Italie.* Par A. J. du Pays. Paris and London: Hachette & Co.

§ *Guides Joanne. Orient.* Par Émile Isambert. Paris and London: Hachette & Co.

of Molière*, which forms the most recent instalment of M. Régnier's admirable collection entitled *Les grands écrivains de la France*. It is a matter for regret that so few materials of a really trustworthy character exist from which we can construct a biography of the author of *Tartuffe*. Racine and Corneille were fortunate enough to find historians in their respective families. Fontenelle's brief sketch of his uncle, and Louis Racine's touching memoirs of his father, are documents which only need comment and illustration; but in the case of Molière we have nothing of the kind to help us. He has left no correspondence, and he wrote very few prefaces to his plays. Those of his contemporaries who took the trouble of noticing him were his avowed enemies, and, in short, the only piece of biography which we possess about him is Grimaire's, which is full of errors, and which has nevertheless become the indispensable accompaniment of all editions of Molière, for want of something better. The memoir prepared by M. Despois for this edition will appear subsequently; the present volume contains two farces, *Le médecin volant* and *La jalousie du barbouille*, which are supposed to be the work of Molière; we have next *L'étourdi* and *Le dépit amoureux*, together with an Italian comedy by Beltramo, entitled *L'Inavvertito*, generally considered as having suggested the former of the two plays last mentioned. Finally, the editor has added a list of all the performances of Molière's plays down to the present day. His notes, prefaces, &c., are exhaustive, and the text is irreproachably correct.

A report was circulated some time ago in certain French papers that M. Dauban's new work † had been seized by the police, chiefly on account of the curious engraving which appears at the beginning of the volume, and which is the reproduction of a German print. This extraordinary composition is certainly not very flattering to France, and the artist, who is no respecter of persons, has managed to turn into ridicule with equally unsparing rigour the Bonapartists and the Republicans, M. Gambetta and M. Rouher, M. Ollivier and M. Victor Hugo; but his impartiality must be his excuse, and the downfall of the French Empire is a catastrophe which all parties (including Napoleon himself) hastened on as much as they could. M. Dauban's idea, however, is to expose the true character of the *nouvelles couches sociales*, and to give us the real history of the Commune. With that view he has thought it well to allow M. Raoul Rigault and his colleagues to speak for themselves, and his book may be described as a collection of official documents emanating from the revolutionary Council which during the month of May 1871 renewed in Paris the scenes of the Reign of Terror. M. Dauban introduces his *recueil* by a curious and at the same time melancholy essay on the state of French society under the Second Empire. A number of autographs illustrate the volume.

M. Wallon, member of the Institute, and author of several valuable historical works, had reviewed in the *Correspondant* ‡ the *Histoire de la Terreur* by M. Mortimer Ternaux, and several other books written on the events of the first French Revolution. These articles, originally published between March 1870 and August 1872, have been since completed by the addition of entirely new matter, and the two volumes which now contain them give a very interesting and satisfactory account of the events of the years 1792 and 1793. M. Wallon remarks in his introduction that the political system known by the name of "Terrorism" was only waiting for a favourable moment to continue and carry out the old traditions of the *Comité de salut public*. As soon as a stupendous war had paralysed the forces of the nation, the successors of Marat, Danton, and Collot d'Herbois came forward and faithfully worked out the programme of 1793—with this only difference, that the discoveries of modern chemistry enabled them to destroy more thoroughly than their predecessors had done seventy years ago. M. Wallon wishes that the perusal of his book may encourage honest men to preserve among themselves a union without which the events of 1793 and 1871 must infallibly be once more repeated.

Among other instructive documents on the late political history of France we must mention the Report drawn up by M. Saint-Marc Girardin in the name of the Committee of investigation appointed to examine the acts of the *Gouvernement de la défense nationale*.§ It is a valuable sketch of the last days of the Second Empire, from the events immediately preceding the declaration of war against Prussia to the capitulation of Sedan and the reported death of Marshal MacMahon.

M. Reynald dedicates to Don Emilio Castelar his *History of Spain* || from the death of Charles III.; and in the introductory letter which he inscribes to the Republican leader he gives a short summary of the merits and defects of the Spaniards, considered as politicians. The local institutions in the Peninsula are, he says, excellent, but the central administrations, in most cases, are detestable; the Government has to bear the consequences of a century of misrule, and every one is to blame for the deplorable situation in which Spain is just now. The people slumber in idleness and ignorance, while their leaders squander to no purpose

the resources of the country, and extend centralization to all the provinces, only with the result of increasing disorder and anarchy. M. Reynald would fain hope that the Spaniards will find in the lessons of contemporary history a caution against misgovernment, and he accordingly endeavours to place before them a faithful picture of their recent revolution. The volume is accompanied by two maps.

As we are speaking of Spain, we may here notice the second series of Calderon's plays*, translated into French by M. Antoine de Latour. We must not be misled, he says, by the name "comedy" which we find applied to these productions. Whether the subject is humorous or serious, whether the catastrophe is tragic or comic, all dramatic works in Spain are *comedias fúneas*. M. de Latour gives us here seven of Calderon's plays, together with prefatory notices which form a series of excellent contributions to the history of Spanish literature.

Messrs. Maisonneuve have published several interesting volumes on points of Oriental lore. The first which we have to mention is a treatise on the Life and Sentences of the philosopher Secundus †, well known to students whose attention has been directed to the history of Gnosticism. Schier, Lucas Holstenius, and Orelli have published the Greek text of the work bearing the philosopher's name; Latin translations of it may be found in the *Speculum historie* of Vincent de Beauvais and the *Adversaria* of Bartius; but all these pieces, as M. Revillout observes, are not calculated to give us a very high idea either of Secundus or of his philosophy. On the other hand, it is certain that in the Eastern world a treatise bearing the same name was for a very long time read, copied, and translated with the utmost eagerness by Christians, as being a work of edification. We are thus led to conjecture that, notwithstanding their common title, the two texts were different works; and this fact M. Revillout has ascertained by studying an Arabic MS. preserved in the Paris National Library, and comparing it with an Ethiopic version and a few fragments of a Syriac one. He further maintains that the Greek work is a production of much more recent origin than the Oriental texts, and that it was taken from an Eastern original, which is now unfortunately lost. M. Revillout discusses in a very able manner the literary qualities of the several versions of the Sentences ascribed to Secundus, and gives an interesting summary of the religious and metaphysical views they contain. Whether Secundus himself was a real or a fictitious personage seems doubtful; at any rate his collection of Sentences is nothing else but a philosophical novel composed for the purpose of popularizing the Gnostic theories so fashionable during the second century of the Christian era. Whilst developing this argument, M. Revillout is incidentally led to give us many interesting particulars respecting the various sects grafted upon the luxuriant tree of Gnosticism, especially the Valentinians, and their relation to Christianity.

We are also indebted to M. Revillout for the publication of some most interesting documents ‡ relative to the Council of Nicea. Towards the beginning of the present century the celebrated archaeologist Zoëga had discovered, in a Coptic MS. belonging to the Borgias Museum, a few fragments attributed to the Fathers assembled at that Council; he gave in his catalogue a brief notice of them, but without entering into the details which so important a subject would have justified. Even the complete translations added by him were insufficient, and much remained to be done by subsequent students in the event of fresh texts being brought to light. M. Revillout has been fortunate enough to make this discovery, and, whilst exploring the treasures contained in the Turin collection, he has found two long Coptic fragments which are evidently a portion of the Nicene Acts. One of these, and one only, is mentioned by Amédée Peyron in the preface to his Dictionary, but they are both equally worthy of attention. They give us, first, the Nicene Creed, followed by glosses, explanations, anathemas, &c.; secondly, a treatise of ethics for the use of the Christian Church. Doctrine and practice are thus equally illustrated, and passages have been now published which were not previously known to exist. M. Revillout deserves the thanks of all theological students for the care he has displayed in editing these two texts, supplementing them with a French translation, and illustrating them with a preface and notes.

The work jointly issued by MM. Sauteyra and Cherbonneau § is valuable both as an illustration of Mohammedan law and as a text-book for practical purposes in the colony of Algeria. By a decree issued last month the French National Assembly has decided that the preservation and transmission of landed property shall be for the future settled in Algeria exactly according to the legislation in force in France. This new measure is not considered likely to meet with any difficulty in its application, because the law which it abrogates formed part neither of the Koran nor of the Sunna, and was consequently destitute of the religious character necessary to impose it upon the conscience of the Mohammedans. On the other hand, as the laws applying to persons and to succession have that character, it has been deemed advisable not to alter them, just now at least. Such is the

reason which has induced MM. Sauteyra and Cherbonneau to publish the work of which the first volume is now before us. The text is taken from the Koran, and chiefly from the well-known law treatise of Sidi Khalil, adopted as an authority throughout Northern Africa, and sanctioned by the French Government. The commentary is based upon the Koran, the old Arabian customs, the Mosaic law, as the Mishna and the Talmud have defined it, the Sunna, and the decisions given at various times by the Imams and other magistrates. In order to facilitate references and comparisons, the authors have thought it advisable to follow the system observed in the French *code civil*.

The concluding instalment of the late Baron Rogét de Belloguet's *Ethnographie gauloise* has lately been published.* It treats of the Keynmoi, and discusses fully all the solutions proposed with the view of settling the origin of that people. A biographical notice of the author introduces the pamphlet.

The title which Professor Marcy has given to his book† sufficiently explains the subject of which it treats. He has here condensed, in a very agreeable and useful manner, the lectures given by him at the Collège de France, and the text is illustrated by upwards of a hundred woodcuts.

It is obvious that railway engineering must henceforth be a very important question in modern warfare. Both as means of conveyance and as strategical lines, railways cannot fail to engage the serious attention of military commanders. What are the best means either of destroying them or of constructing them with the utmost rapidity? How can they be laid down with the resources at the disposition of an army on the march? How shall we raise, train, and organize the new branch of the service which altered circumstances require? Captain Isselme does not attempt to answer these questions in detail, but he has put together in his suggestive little volume the facts which it is most necessary to know respecting the construction and working of railways, and the hints he gives can be easily carried out and applied by experienced officers.

The development of industry and of the arts connected with it is one of the most satisfactory results of the progress made by chemistry, and works treating of that subject must always be welcome. We are not acquainted with any scientific work that adequately describes the distillation of wood, and the various substances which that distillation produces. We therefore thank M. Camille Vincent for having endeavoured to supply this desideratum. Twelve years' experience enables him to speak authoritatively on this important branch of practical chemistry, and the monograph in which he has given the results of his experience is exhaustive. It is prefaced with a brief notice of Philippe Lebon d'Amunbersin, who was the first to distil wood for the purpose of utilizing the combustible gases thus produced, and giving to industry the benefit of the acids and tarry elements obtained from the same source.

Dr. Haeckel is one of the most distinguished German representatives of the evolution theory, and his lectures on the natural history of creation are considered to be one of the best summaries that have been published of that often-discussed subject. M. Léon Dumont originally intended to give a French version of Dr. Haeckel's work, but afterwards he considered that an analytical sketch would answer every purpose; and accordingly he has merely contributed a small essay to the *Bibliothèque de philosophie contemporaine*, instead of an elaborate work in four volumes. The preface of the French translator is an eloquent apology for Darwinism, and we are rather startled at finding M. Dumont asserting that the doctrines of the Communist and Socialist agitators are the legitimate result of spiritualism. We persist, he says, in looking upon man as consisting of a body and a soul; hence, as he oddly infers, all our political calamities.

We have two more volumes of Saint-Simon's Memoirs; the reign of Louis XIV. is coming to a close amidst the curses of an oppressed nation, and the War of the Spanish Succession exposes the deplorable nullity of the *grand monarque's* generals and Ministers. It is amusing to see how the incapable Villeroi is handled by Saint-Simon: his portrait of that commander seems overdrawn, but contemporary evidence proves that it was only an expression of the sober truth. Imagine the destinies of France placed in the hands of a man respecting whom it is said, "He was cut out on purpose to preside over a ball, to be the nuptial at a tournament, and to sing at the opera the parts of kings and heroes, if only he had voice enough. He was likewise admirably qualified to set the fashion; but in every other respect he was absolutely null." It seems incredible that Louis XIV. should have been so thoroughly infatuated as he was by a man who on the field of battle exhibited the utmost presumption with total want of skill; whilst at the council board he rendered himself equally conspicuous by his pride, his cringing disposition, and his ignorance.

M. Alfred Assollant was very near meeting with the same fate as Madame de Staël when she published her book on Ger-

many. The preface he has added to the new edition of *Marcomir** sufficiently proves that the traditions of despotism never undergo much variation, and that Count Serrurier, who twelve years ago presided over the *commission de colportage*, faithfully followed in the wake of the Duke de Rovigo. Whilst, however, the gifted daughter of M. Necker saw an entire edition of her work destroyed, M. Assollant fared considerably better. M. de Persigny not only revoked the decree issued by Count Serrurier, and which absolutely prohibited book-hawkers from selling *Marcomir*; he went so far as to offer to M. Assollant the post of *rédauteur en chef* of a Government newspaper. If our readers will take the trouble to peruse the keen satire which makes up the *Histoire d'un étudiant*, they will see at once why, in the first place, the circulation of the volume was imperilled, and, in the next, why M. de Persigny was anxious to win over to the cause of Bonapartism so clever a writer as M. Assollant.

The *Impressions et souvenirs*† of George Sand, the *Lettres d'une honnête femme*‡ published under the name of Madeleine, and the *Mémoires d'un coiffeur*§, by M. Ernest Feydeau, are three interesting volumes. Madeleine is a keen politician, very enthusiastic for M. Thiers, and fully justifying by her common sense and her uprightness the epithet which appears on the title of her book. The letters she now publishes are reprints from the *feuilleton* of a Paris newspaper; and we have remarked especially an excellent critique of the *Enchantements de Prudence*, which we reviewed a little while ago. This extraordinary book was issued, the reader may remember, with an introductory recommendation from George Sand, who has reprinted her preface in her *Impressions et souvenirs*. M. Feydeau discourses about stockjobbers with a sincerity which ought to deter young men from rushing unadvisedly into money transactions.

M. Stapfer has brought to a conclusion in the *Revue suisse*|| his sketch of Beaumarchais; M. Maurice Vernes gives us likewise the last part of his essay on experimental psychology; and M. Amédée Rogét contributes a chapter to the religious history of our own times, by describing the campaign lately carried on at Geneva against the Ultramontanists.

MR. BRIGHT AT BIRMINGHAM.

IT is a long time since so much enthusiasm has been excited by any political event as by Mr. BRIGHT's speech on his re-election for Birmingham. He has been silent for some years, and a natural regret and pity for the cause of his silence combined with the novelty of hearing him to give an accidental interest to everything he might say. His speech was also regarded as an occasion when the wounds of discontented Liberals might be healed, and comfort and confidence imparted to them after they have been, in their opinion, somewhat badly treated by a back-sliding Ministry. The fact, too, that Mr. BRIGHT was to speak as a Minister of the Crown opened the delightful prospect of hearing what the Ministry intended to do for the future, or at least of hearing what Mr. BRIGHT would try to make them do. We should suppose that very few of those who came with high expectations went away disappointed. They listened to a speech full of animation, choicely worded, admirably arranged. Mr. BRIGHT candidly owned that he had no secrets to tell, and he took care so to speak as not to pledge his colleagues. But he spoke like a man occupying a great position, and knowing that he occupied it. He appeared as the kind critic and wise friend of the Government quite as much as a member of it. He meant to make a great party speech, and he made it. He praised the Liberals, and he ridiculed the Conservatives, but he managed to avoid the customary mode of handling the subject. He spoke of the great things done by the GLADSTONE Government; but he claimed approbation for them, not as isolated measures of legislation, but as expositions and recognitions of great principles. He combated the Conservatives not only as the opponents of all useful reforms during forty years; and as now sitting at power without having any notion of what to do with power if they attained it, but as specially unworthy to be trusted with the wide measures of electoral reform which he suggested the next Parliament will have to deal with. Nor was the future programme of the Ministry passed over; and Mr. BRIGHT hinted, vaguely perhaps, but still pointedly enough to make delightful hopes spring in the breasts of some of his hearers, that the claims of free land and a free breakfast-table could not and would not be forgotten. But then his audience wished Mr. BRIGHT to do something more than exalt the Ministry and reveal its principles and its plans. They came to hear not only a member of the Government, but Mr. BRIGHT, and there was plenty in the speech to satisfy them. His personal element never disappeared from the speaker's utterance. He offered as his personal opinion the suggestion that England had better quit the Gold Coast altogether. He informed his audience that he knew nothing of the Education Bill before it was proposed or while it was being discussed, and that he heartily disapproved it, although, with a tender recollection of what was due to a colleague, he protested that he did not believe Mr. Forster understood at the time the mischief he was doing. Mr. BRIGHT even allowed it to be known that he had a scheme of his own, which he did not explain, whereby all the evils which he attributed to the working of the 25th Clause might be removed without any one of any party being harmed. And then, finally, he constantly let his hearers understand, that he was after all a remarkably safe and reasonable man, one to whose gentle reforms, not violent revolutions, he drew, and inspired the agreeable persuasion that to walk in his steps was to tread the path of patience and wisdom.

Mr. BRIGHT's speech, therefore, deserves the highest praise if it is considered merely with reference to the general

diate purposes for which it was spoken. But if we turn to look at it as a manifesto of the more advanced section of the Government, addressed to the nation at large, there is much in it to suggest serious misgivings. Mr. BRIGHT laughed at the Conservatives for not having a policy, but he may possibly have done much towards helping them to have a policy. His new theory of the principal measures of the Government being embodiments of great general principles is full of danger to the electioneering prospects of the Liberal party. He sees in the disestablishment of the Irish Church an embodiment of the great general principle that Congress may be conveniently disestablished. This does not at all correspond with the language held by the Ministry while the Irish Church Act was under discussion. Then we were told that the case of the Irish Church was a purely exceptional one. It was because it was not in any proper sense an established Church, but a Church forced by a minority on a majority as a symbol of conquest, that Parliament was asked to interfere. In the same way Mr. BRIGHT regards the Irish Land Act as a typical instance of the realization of the great and general truth that Parliament is to attend, not only to the interests of the landowners, but to the interests of the lower orders. Mr. GLADSTONE gave an entirely different account of his measure when he introduced and defended it. Irish land was, according to his view, to be dealt with in an extraordinary manner simply because the history and fortunes of Irish land were altogether extraordinary because everything relating to it was so confused, and Irishmen were so incapable of understanding or acting by their ordinary legal rights and duties, that Parliament must step in, cut the knot, and give all parties a fresh start. Mr. BRIGHT's new version of the history of these two measures is as likely to help the Conservatives as anything could be. These Irish Acts have been their great difficulty. They opposed them while the country at large was enthusiastic for them, and the memory of this opposition has weighed heavily both on them and on the country. They cannot think of proposing to repeal the Acts that have been passed; they are obliged to wander into deserts of controverted statistics if they wish to show that the Acts have not done all the good which it was prophesied they would do. But now they may ask that their opposition to these measures shall be regarded in a new light. They may fairly say that what they protest against is that measures shall be presented to Parliament as exceptional, and then, when carried, shall be assumed to have established general principles. In this way, they may urge, the nation is betrayed into sanctioning what it does not mean to sanction, and their policy will be to try to prevent anything of the same kind happening for the future. This is certainly only a negative policy; but it is a negative policy of a specific and telling kind. It aims at putting a stop to a particular mode of conducting public affairs which the party consider dangerous and unworthy of the country. It draws a distinct line between men who conduct public business in one way and men who conduct it in another, and this is exactly the issue which the Conservatives want to have raised at the next general election.

Mr. BRIGHT's speech is also very unsatisfactory in another way. He told his hearers that the Education Act had failed because Parliament and the Ministry had taken up the subject before it had been sufficiently under the discussion of the country at large. Whether this is a true account of the history of that Act is another matter; but every one will agree that it is dangerous when a Ministry and Parliament seem to say to themselves that they will do something grand with regard to such a matter as national education without having any real mastery of the problem

to be solved. But this is unfortunately exactly the way in which Mr. BRIGHT seems to approach those political questions which he tells us are ripe for settlement. He entirely declined to go into speculative politics; he would only notice matters on which speedy legislation was desirable and possible. The direction in which of all others he thinks it easy and practicable to legislate is that of enabling poor men to better themselves by becoming owners of land. He thought that the present system under which big landholders and big farmers exclusively flourish does not give the labourer a fair chance, and at the same time he carefully guarded himself against seeming to wish unfairly to sacrifice existing interests. But he gave no sort of hint as to what measures could be devised to give the labourer a chance of bettering himself by becoming the owner of land. He seemed to desire to get the credit, or at least to afford himself the pleasing prospect, of doing something grand for the labourer, without having first discussed with himself how this is to be done. His views on the Game-laws were equally hazy. He asked whether it was not monstrous that game should not be the absolute property of the tenant. Game is not the absolute property of any one, and Mr. BRIGHT would perhaps not be very much inclined to help to pass a law making it so; but the tenant has by law the right of killing it on the land he hires, and he usually sells this right to the landlord. If Mr. BRIGHT had put his question accurately, he would have asked whether it was not monstrous that a tenant should forego for a pecuniary consideration his right of killing game found on his land. But then the question would have been rather bald and tame. It is impossible not to see that in all the part of his speech which referred to the programme of the Ministry Mr. BRIGHT allowed himself to fall into the dangerous practice, too common among advanced Liberals, but distressing and offensive to moderate men, of treating questions calculated to excite the hopes and passions of humble men in a broad general way, so as to leap at once to an imaginary goal of good government without any sign being given that the real difficulties of the subject have been considered and surmounted. There is something hollow and pretentious in the proposal so to legislate as to make the condition of the labourer better by enabling him to become on easy terms the owner of land, unless we find that the author of the proposal has thought out the preliminary question whether any laws, not spoliatory, can effect this, and whether, if they could, the position of the labourer would be bettered. What we want a speaker on the Game-laws to do is not to ask whether facts inaccurately stated are not monstrous, but to show us that the stringent laws of trespass which must replace the Game-laws would not be a greater practical inconvenience. Those who want this kind of enlightenment before they are attracted by schemes of reform will find nothing in Mr. BRIGHT's utterances to satisfy them; and one consequence will be, that however much they may admire Mr. BRIGHT's speech in many ways, they will be obliged to confess with regret that no signs are to be gathered from it that the Government has before it a programme of wise and defensible improvements.

THE PARLIAMENTARY COUP D'ÉTAT.

THE Count of CHAMBORD has been caught at Salzburg, and has given such satisfactory assurances to his pursuers that the restoration of the Monarchy is to be proposed as soon as the Assembly meets. This is not the time to examine the nature and value of the concessions which have thus at the eleventh hour been extracted from the heir of the Bourbons. It may be assumed for the sake of argument that they are all that the most constitutionally minded Orleanist can desire. No virtue that can be attributed to them will avail to make the action of the Royalists anything else than a conspiracy. It will in all probability be a conspiracy carried out under Parliamentary forms. The resolution declaring France an hereditary, national, and constitutional Monarchy will be introduced, debated, and voted on in a strictly regular way, and the proposed Restoration will not be attempted unless the division list shows a majority in its favour. Here no doubt are all the technicalities of Parliamentary procedure, and though the devotion of the army to Marshal MACMAHON is beginning to be paraded with unnecessary and suspicious frequency, we will concede that they will be rigidly adhered to. But the

spirit and substance of Parliamentary procedure will be wanting all the same. The Monarchy will be imposed upon France by the vote of an Assembly which, judging from the recent elections, does not represent France.

It is so important to a clear appreciation of the morality of the Royalist policy to keep this fact in view, that we shall set out the proof of it, even at the cost of some repetition. In the first place, there is the steady drift of the partial elections since 1871. That the majority of the candidates returned while M. THIERS was in power were favourable to the Government meant nothing so long as there had been no election under his successor. It used to be said that in France the Government for the time being always carries the electors with it, and though M. THIERS gave the constituencies much more liberty than they were accustomed to look for, the habit of obedience was supposed to be strong enough to secure the accustomed result. The elections of the 12th of October have placed the partial elections that preceded them in a new aspect. French constituencies do not, it appears, always support the Government of the day. The principal quarrel the Conservatives had with M. THIERS was that he allowed improper candidates to be returned. They refused to believe his assurances that he had no part or voice in the matter; he might, they insisted, have had a determining voice in it had he chosen. This is pretty good evidence that when the Conservatives came into power they did not neglect the instrument which they had accused M. THIERS of neglecting. There can be no doubt that ever since the 24th of May the Prefects have been working their hardest to bring the voters in their several departments to look at public affairs from the Ministerial point of view. The elections of Sunday week show how entirely they have failed in this, and their failure has further shown that the Republican character of so many previous elections had a significance which at the time was not attributed to it. The second proof that the Assembly does not represent France is the determination of the Royalist party not to put the question to the test. It is not to be supposed that men like the Duke of BROGLIE or Count D'ARL—men who have been Constitutional Liberals from the time they first cared for politics down to the 24th of May last—would not gladly assure themselves that they have the country at their back if such an assurance could by any means be obtained. Even the thoroughgoing Legitimists, though they care nothing about the feeling of the electors and might like to see Parliaments altogether abolished, would still be glad to throw the consent of the nation at their adversaries if they thought that it was theirs to throw. Indeed the importance which, at the time of the change of Government the Conservatives attached to the management of the elections, and the volley of circulars to Prefects with which M. BERTHÉ celebrated his entrance upon office, seem to show that the original intention of the party was to bring the electors to a right frame of mind, and then to dissolve in the certainty of obtaining a large Royalist majority. Now that they have had time to survey the ground, they see that such a consummation is beyond their reach, and they have consequently made up their minds to do their best with the Assembly that they have. But we may be sure that nothing but the doubt whether a new Assembly would serve their purpose could have led them to take this course. M. JOHN LEMOINNE argues that there is nothing in the plea that the Assembly does not represent France, because it was never raised when the late Government proposed that the Assembly should consolidate the Republic. This argument is disposed of by the fact that the Republicans were at all times willing to abide by the issue of a general election. If they recognized the competence of the present Assembly to make the Republic, it was because the Conservative party objected to entrusting the task to another Assembly.

A Parliamentary Restoration the promoters of which are perfectly aware that the Legislature to which they appeal does not represent the constituencies is nothing better than a Parliamentary *coup d'état*. The prostitution of Parliamentary forms to secure a result which is known to be opposed to the wishes of those by whom the Parliament has been returned only makes the manoeuvre more indecent. When NAPOLEON packed the deputies off to Mazas, he had two excuses which are wanting to the present Conservative majority. He was an avowed disbeliever in the virtue of Parliamentary government, and he intended to appeal to the nation in a way which, irregular and unreal as it was, was still preferable to the present scheme of silencing the nation

altogether. If the Assembly had really represented France, and had thereupon been sent about its business by the Royalists, the insult to the nation would have been no greater than it is when the Royalists use an Assembly which does not represent France as a convenient instrument for the accomplishment of their plans. The condemnation incurred by those who lend themselves to this conspiracy must be unequally distributed among the three factions which make up the Royalist party. In this apportionment of blame the Legitimists come off easily. To be sure they are prepared to become themselves and to make their countrymen the slaves of HENRY V., but much may be forgiven to men who honestly believe that such a servitude is really the noblest freedom. They at least have falsified no past professions; and if they condescend to work out their purposes through the agency of an Assembly which is representative only in name, they can plead that, as their principles do not bind them to consult anything but their Sovereign's pleasure, all that they do over and above is a matter of grace, and as such not to be criticized. The Orleanists have no such excuse to offer. They claim to be Constitutional Royalists—Royalists, that is, who regard the consent of the governed as an element of equal importance with the will of the governor. The founders and supporters of the Monarchy of July must be acquitted of cherishing any special reverence for legitimacy or hereditary succession. Their natural chiefs have for many years been understood to entertain no ambition beyond that of holding themselves at the disposal of France, if France should ever call for their services. There was nothing in these antecedents to justify an expectation that either Princes or followers would become accomplices in an attempt to make France once more a Monarchy through the agency of a fortuitous concurrence of deputies who know that they would lose their seats if any unforeseen ill fortune should force them to face their constituents. The Conservatives have been accustomed to say, with some reason, that the late Government of National Defence was founded by men whose sole title to be makers of governments was the accident that they happened on the 4th of September to be loitering near the Hôtel de Ville instead of on the Boulevards or in the Champs Élysées. The hereditary national and constitutional Monarchy will be founded, if founded at all, by men whose only title to be makers of governments is the accident that they were elected in February 1871 to conclude a peace with the Germans. This is the sort of Restoration which the apostles of constitutional liberty in France have brought themselves to consent to, or rather to further. The Legitimists alone could never have raised the Count of CHAMBERS to the throne. If he wears the crown at all, it will be the hand of the Count of PARIS that has placed it on his head. If the grandson of LOUIS PHILIPPE will not reign over unwilling subjects, he has seemingly no objection to help another pretender to reign over unwilling subjects. "Qui facit per alium facit per se" is a maxim which has no meaning in his eyes. If the Orleanists carry off the prize for self-stultification in this singular competition, the prize for folly pure and simple must be assigned to those Conservatives who, caring nothing for Monarchy, but a great deal for their own security, think that they will find it under the shelter of a throne which will have no better foundation than a strict party vote in an Assembly which does not even reproduce the distribution of parties out of doors. A Restoration of this kind is an undesigned invitation to future adventurers to try whether a throne so easily founded may not be as easily overthrown. If any respect is paid to the idol which the Assembly will soon be asked to set up, it will be paid, not to the decree of the Legislature, but to the bayonets which the Executive that controls the Legislature is known to hold in reserve. To-day the troops obey Marshal MACMAHON, and Marshal MACMAHON obeys the Assembly. To-morrow they may obey some other commander, and that other commander may obey his own ambition. This is the contingency upon a contingency to which the Monarchical Conservatives are prepared to trust the future of France.

THE QUARTERLY REVIEW ON LIBERAL POLICY.

A POWERFUL writer in the *Quarterly Review* has undertaken to answer the challenge addressed by Liberal speakers to the Conservative party to declare their policy. The reply is rather a counter attack than a defensive statement. The writer is distinctly and habitually

ally distrusts proposals of political change can scarcely be expected to announce large and comprehensive reforms. Sir ROBERT PEEL indeed remodelled the finances and the commercial policy of the country; but the greater part of the work which he commenced is already accomplished; and his acknowledged successor in the direction of fiscal policy is the chief of the present Government. As long as Mr. GLADSTONE continues to regulate taxation for the general interest without political preference of one class to another, no other financier will command equal confidence. The essay in the *Quarterly* perhaps scarcely represents the opinions or wishes of the Opposition; for the writer would apparently be perfectly contented that the present Ministers should remain in office, if only they would repudiate the policy of their extreme Liberal allies. Of the particular blunders and the personal scandals which have from time to time thrown temporary discredit on some of the Ministers, the Reviewer speaks with commendable indifference. He perhaps underestimates the effect of the reflected unpopularity of some members of the Government; but it is certainly not a reason for a great political change that the subordinates in one or two departments dislike the head of the office, or that deputations have been received with insufficient courtesy. The constituencies care little or nothing for the faults of manner or of temper which sometimes alienate supporters and encourage opponents in the House of Commons. Lord PALMERSTON during his first term of office as Prime Minister was tempted by the elation of success to assume a careless and supercilious demeanour which was the principal cause of his defeat in 1858. On his return to power in the following year he had the good sense to avoid a repetition of his former blunder; and from that time to the end of his life he was as popular in Parliament as in the country. If some of his successors are not equally capable of profiting by experience, they may feel confident that the result of a general election will never be determined by personal considerations. The majority in the House of Commons likes Mr. DISRAELI, but it declines to give him its vote.

The most sagacious observer would at the present moment be the first to acknowledge the impossibility of anticipating the result of the next appeal to the constituencies. It may be conjectured from the Ministerial victories at Bath and Taunton that the licensed victuallers are no longer implacable, having indeed sufficiently proved to their former assailants that they are not to be disturbed with impunity. At both places the successful candidates were moderate in their professions, and perhaps they may be still more moderate in their political tendencies. Neither Mr. HAYTER nor the SOLICITOR-GENERAL desires to subvert the institutions of the country; but the average elector draws no nice distinctions among members who bear a common designation. Mr. JAMES and Mr. CHAMBERLAIN are both nominally Liberals, although their opinions differ far more widely than those of the majority and minority in the House of Commons. As it was necessary for the interpretation of NEBUCHADNEZZAR'S dream that the dream itself should be first known, the significance of the next general election will depend on the questions raised between the contending parties; and it rests with Mr. GLADSTONE to settle the issues. It may be taken for granted, notwithstanding the injudicious bid which was lately made for the suffrages of Whitby, that no direct attack on the Established Church is at present in contemplation. Notwithstanding unauthorized disclaimers by private Secretaries and junior Lords of the Treasury, Mr. GLADSTONE'S answer to Mr. MIALl was evidently sincere as well as vigorous. It is far more likely that the Government may select as the occasion for dissolving Parliament some measure which will injuriously affect landowners. As the writer in the *Quarterly* justly remarks, a limitation of the power of devise and settlement would be less likely to attract popular favour than an interference between landlords and tenants. No measure which fell short of the introduction of the French rule of compulsory distribution would materially affect the devolution of land, nor is any special class interested in preventing the settlement of real or personal property on unborn children. Theorists only appreciate the public advantage of bringing land more frequently into the market, and they are not agreed among themselves as to the operation of the present law or custom. Tenant-farmers, on the other hand, form a definite and powerful body; and if they were offered, like the small Irish occupiers, a share in the

property of the landlords, they would probably not refuse the boon; yet the agitation of Mr. AECH and his condutors will render the farmers suspicious of even plausible innovations. Fixity of tenure, as it is advocated by Mr. J. HOWARD and others, could only be established by an act of legislative spoliation; and when the principle of transferring property for the public benefit was once admitted, the labourers would have equally plausible claims to prefer against the farmers. Another mode of attack upon landowners might be a proposal for the readjustment, to their injury, of local or general taxation. In dealing with schemes for the arbitrary exemption of certain kinds of property from national imposts, Mr. GLADSTONE's sense of justice would be reinforced by his scientific conscience as a master of economy and finance. Even if he were in some unexplained manner to become careless of right and wrong, he would still retain a sense of symmetry and a repugnance to fiscal anomalies. It is more probable that he will make an effort to throw the burden of local taxation on landlords than that he will make them pay Income-tax for brewers and bankers as well as for themselves. Mr. GOSCHEN's unjust measure of 1871 was introduced with the sanction of the PRIME MINISTER; and Mr. GLADSTONE, as well as Mr. GOSCHEN himself, has often referred to the subject in a tone of taunt and menace.

The general election will perhaps turn rather on the political alliances which the Minister may contract and proclaim than on any special measure. If he bids for the support of Mr. LEATHAM and Mr. CHAMBERLAIN, he will be held to have virtually pledged himself to all the subversive doctrines which are embodied in their favourite formula. Free Church, which means the abolition of the Church; free land, in the sense of expropriation of landowners; free schools, with compulsory secular education; and free labour, which has at present no definite meaning, may possibly find favour with the constituencies created in 1867 and voting by ballot; but no extreme Liberal has for some time past been returned for any vacant seat; and it is scarcely probable that the Government will pledge itself to a series of revolutionary measures. The extension of the household franchise to counties, though, in accordance with Mr. DISRAELI's policy, it has been but faintly resisted by the Conservatives, would be in the highest degree distasteful, and even alarming, to the tenant-farmers; nor could the tradesmen in the towns regard with complacency a large increase in the electoral power of the working classes. It will be difficult for the Government to propose any considerable change which will not offend some of its former supporters. A year or two ago one of the present Ministers candidly declared that it was essential to the Liberal party to devise new measures for the purpose of justifying its own existence. Later experience has perhaps suggested a doubt whether it is prudent, in default of definite schemes, to create a general feeling of uneasiness among those who have anything to lose. It was said, perhaps with some exaggeration, that one careless speech in which Mr. GOSCHEN wantonly denounced corporate endowments alienated from the cause of the Government large numbers of its most intelligent supporters. The apparent object of the writer in the *Quarterly* is to persuade the moderate Liberals that it is their duty to impress their own policy on the leaders of the party; but the appeal to their reason and their interests is made in a sarcastic tone which indicates little hope of success. In Parliament the large body of Ministerial supporters which detests free land and all the other newfangled phrases about freedom may take many opportunities of applying to the Government a pressure which is not perhaps always unwelcome. At a general election, unfortunately, a candidate must, in spite of conventional professions of independence, echo the party cry, on pain of being regarded as a deserter. It is perhaps hard on conscientious electors that they should have to choose between the followers of Mr. DISRAELI, whom they perhaps profoundly distrust, and the pledged supporters of any policy which it may please Mr. GLADSTONE to adopt on the spur of the moment; but the embarrassing dilemma could only be avoided by a change in the characters of political leaders. It was long since said of Sir ROBERT PEEL that he had conferred on his adherents an incalculable benefit by teaching them how to remain Tories without being fools. Lord PALMERSTON at a later period performed a not dissimilar service to Liberals who sincerely cared for freedom and were exempt from bigoted attachment to abuses, while

at the same time they utterly objected to political or social revolution. The House of Lords contains two statesmen, either of whom might fitly represent and guide rational Conservatives or temperate Liberals; but it unluckily happens that peers are removed from the political centre of gravity.

GREECE.

THE veteran friend and censor of the Greeks, who has long been accustomed to record their miscarriages in the hope of correcting their political errors, has lately published in the columns of the *Times* an instructive summary of Greek history since the attainment of independence. It is doubtful whether any alternative system of government could in the circumstances of the case have been established or maintained; but a centralized democracy, alternating with despotism founded on corruption, has produced unsatisfactory and inglorious results. In other fields of activity the modern Greeks have given ample proof of ability and versatile energy. Before and since the War of Independence Greeks have held high positions in the Ottoman Empire; the race has long been distinguished in maritime enterprise, and their merchants compete on equal terms in Manchester and London with the most successful native capitalists. It is only at home that the Greeks fail in producing the prosperity of which their country is capable; and yet they cannot be accused of deficiency in patriotic aspirations. The so-called Great Idea, or dream of creating a Greek Empire in South-Eastern Europe, might have been thought a proof of laudable ambition if it had only been justified by the preliminary condition of political superiority to all neighbouring races. The wonderful civilization of ancient Greece, appropriated and used by a conqueror of surpassing genius, rendered possible the establishment of the Macedonian kingdoms which maintained themselves for centuries in Asia and Egypt. At a later period the Byzantine Empire, notwithstanding its Roman origin, became after some generations essentially and exclusively Greek. Of the two dominant nations of the ancient world the more brilliant and intellectual was only second to Rome in the faculty of political organization. The small city of Athens produced a succession of statesmen who might have governed the world; and the later rulers of the East inherited their supremacy from the fellow-citizens of THEMISTOCLES, of PERICLES, and of DEMOSTHENES. The Greeks of the present day come too late to revive the primitive tradition; but, like their remote ancestors, they are surrounded by less cultivated nations to which they might furnish an example of orderly and efficient administration. It was not by talking about great ideas that ALEXANDER undertook and partially accomplished the fusion of Greeks and Asiatics into one political community.

Every spot which was selected for the foundation of an ancient Greek colony was an encroachment on the region of barbarism. The cities which studded the coasts of Thrace, of Asia Minor, of Northern Africa, and of Italy were, under numerous varieties of political constitution and in spite of intestine feuds, centres of culture to their respective districts. The only territory which has in recent times been added to the kingdom of Greece has lost the good government and prosperity which it enjoyed down to the date of the cession. There were plausible arguments, and also sound reasons, for the retirement of England from the Protectorate of the Ionian Islands. The Government probably recognized the advantage of being relieved from an onerous duty; but the reluctant consent of the English nation was only obtained on the suggestion that the union of the islands with the continental kingdom would satisfy the longings and promote the welfare of the Greek nation. It is difficult not to regard with complacency the poetical justice of the retribution which has fallen on the respectable classes of Corfu and the other islands. The merchants and landowners had long attempted to combine the benefits derived from just and regular administration with the popularity which was cheaply won by affected assent to the doctrines of separatist demagogues. The sheep protested in concert with the wolves against the usurpation of intrusive watchdogs, and the flock now experiences the results which follow from the withdrawal of the guardians of the fold. The decay of the Ionian Islands might still be arrested if the Greeks had sufficient wisdom and courage to establish a vigorous Government. Instead of attempting to preserve the sound and beneficent admini-

nistration which was left them by the English, the Greeks thought fit to concentrate their energies on a project for the further extension of their territory by piratical attacks on the Turkish dominions. To a certain extent they can play at aggressive war without danger of retaliation, because the European Powers would, as they know, not permit the reconquest by a Mahometan Power of any portion of Greece. In Epirus or in Crete the Turks are forced, notwithstanding their military and maritime superiority, to content themselves with the suppression of the insurrections which are periodically fomented by their potty and troublesome neighbour.

The advice which is once more offered to the Greeks by one of their best and most judicious friends is the same which they have neglected for the last half-century. Before they aim at national aggrandizement, they ought to suppress brigandage, to make roads and bridges, to discontinue or moderate, if possible, the incessant struggle for place, and to abolish the oppressive system of taxation which hampers agriculture without producing equivalent advantage to the treasury. The obsolete practice of levying taxes on farm produce in kind involves still graver inconvenience than the discouragement of enterprise. To prevent frauds on the revenue, it is thought necessary to place all harvest operations under the control of Government officers, as the simpler processes of a distillery are in this country subjected to the inspection of excisemen. A farmer who pays a higher tax in proportion to the goodness of his crop, and who cannot reap or carry without official permission, is not likely to undertake profitable experiments, or to make the most of his land. When the crop is secured, it must either be consumed in the immediate neighbourhood, or taken to market on the backs of beasts of burden; and perhaps it may also be necessary for the owner to pay a portion of the proceeds to some robber chief who pursues his trade with ease and convenience in a trackless region. A few of the members of the profession were a few years ago happily expended in the civil war in Crete, but since that time some of the most notorious outrages, including the tragic affair of Marathon, have been perpetrated with impunity. For the moment the virulence of the social plague has diminished, and it seems that some branches of industry, such as the cultivation of the currant vine, are pursued with success in the neighbourhood of towns. The vicious nature of the system of rural taxation has been curiously illustrated by a recent reduction of fifty per cent., which afforded no practical relief to the farmers. The vexatious interference of the tax-gatherer was still indispensable, and ultimately the former rate was re-established without serious opposition or remonstrance. Although money payments are unwillingly made in Greece, as in other Eastern countries, it can scarcely be impracticable to substitute fixed imposts for tithes or proportions of produce.

The most creditable part of the administrative policy of Greece has been the encouragement of education, which must have developed the natural intelligence of the people. The same cause has unfortunately created a large body of political adventurers who are incessantly contending with one another for office and power. As there is no aristocracy in Greece, the Constitution is necessarily founded on the assumption of universal equality; but the secret of establishing a really representative Assembly has not yet been discovered. The KING, who has now attained full maturity, possesses larger prerogatives than ordinary constitutional sovereigns; and he would be supported by national opinion in any well-considered exertion of his power for the public advantage. When the Greeks succeeded in learning and practising the art of government, they may still hope to influence the future destinies of the East, if the decay of the Ottoman Empire should end in its collapse and disruption. For the present their ambitious schemes are checked by the effects of an ecclesiastical schism. The people of Greece are neither fanatical nor priest-ridden, but historical causes have to a certain extent identified the interests of the Church and the nation. In consequence of jealousies which it is unnecessary to examine minutely, the Bulgarians have lately discarded their religious allegiance to the Greek Patriarch; and the sectarian dispute may perhaps be part of a Slavonic movement which would be hostile to Greek pretensions. It can no longer be assumed even by orators and political agitators that the Greeks would be the necessary successors of the present rulers of the old Byzantine dominions. The Russians have of late years directed their efforts to a union

under their own supremacy of the Slavonic tribes in the Turkish and in the Austro-Hungarian dominions. Patriotic Greeks can have no desire to see their traditional capital absorbed in the Russian Empire, nor will they be inclined to promote disturbances in Turkey for the benefit of their Slavonic rivals. An interval of tranquillity may perhaps induce them to employ themselves in domestic reforms.

THE OXFORD UNION.

EVERY body of men in these days finds some occasion to celebrate its doings and advertise its existence; and as an undergraduate Debating Society has now gone on for fifty years at Oxford, it is natural that this should be considered as entitling it to hold what is termed a Jubilee. Eton led the way in cultivating the art or amusement of debating, and when clever Eton debaters got to Oxford, they missed their customary pleasure, and organized a Society where they might go on talking with the increased experience and enthusiasm of early manhood. This infant Society started with some disadvantages and some striking advantages. Its founders or early members had difficulty in securing a place of meeting; they were frowned on by the University authorities, they had no very clear conception of their own purposes, and they quarrelled bitterly among themselves. On the other hand, they happened to be a set of young men of extraordinary promise, and many of them were born in a position which ensured future distinction. At a time when the Society had been rather less than ten years in existence, the happy fortune of the Union gathered together a set of youths who were exceptionally distinguished as undergraduates, and who have since made their names known to every Englishman. As forty years have elapsed, these young orators are now between sixty and seventy, and have therefore attained the age when fame and reputation are most firmly established. Two of the most conspicuous of them, Mr. GLADSTONE and Mr. LOWE, were not present at the Jubilee meeting, and so little, even in a debating society, are the claims of brilliant debaters thought paramount, that when the LORD CHANCELLOR regretted the absence of the PRIME MINISTER, his expressions of regret were received with some marks of disapprobation. But the heroic period of the Union was well represented by the Archbishop of CANTERBURY, the CHANCELLOR, Archbishop MANNING, and Mr. CARDWELL. The Union never at any subsequent period rivalled the splendours of those early days; but it has always gone on sometimes rising and sometimes falling in the success of its debates. By degrees the Society established itself in a position which made it secure of a comfortable existence independent of the fluctuations of rhetorical success. It was transformed into a well-managed club with an excellent library, the treasures of which were made available by the permission to members to take books to their colleges. Most of its members enjoyed the privileges of reading in comfort every conceivable newspaper and periodical, of writing on gorgeous note-paper letters which the Society stamped for them, and borrowing some useful and many entertaining books, without giving more than a passing thought to the debates which had once been the keystone of the Union. Still the debates went on, and, as they offered practice of no inconsiderable value for speakers who wished subsequently to shine in Parliament or at the Bar, there was never wanting a series of torchbearers to hand on the lamp of oratory; and the Society at its gathering was able to see in the presence of the ATTORNEY-GENERAL, Lord SALISBURY, and Mr. GOSCHEN a sign that it had continued to supply from among its own most distinguished members men who had subsequently shown that they could distinguish themselves in the higher arenas of real debate.

An instructive and pleasantly written paper in *Macmillan's Magazine* has lately given an opportune history of the Union in its early days of greatness; and some amusement is naturally awakened when we read in its pages the fierce Tory utterances of speakers who have since become famous as Liberals. But the opinions of young men fresh from public schools are necessarily of little value, and are based on imagination, or home sympathies, or traditions. Until recently the vast majority of undergraduates were the sons of clergymen and landowners, and the members of the Union came to hear or make speeches hot with the affections and prepossessions of the classes to which they belonged by birth. Those who opposed the current of undergraduate

opinion were animated by the opposition they excited, and cheered by the reflection that the public outside the body they were addressing was generally on their side. Hence the Union has enjoyed the possession of one of the cardinal elements of a good debating society—the interest of the audience in the subjects discussed, and its admiration and detestation of opposite principles. Lord SALISBURY referred with some pathos to the different experience of his later life, and pitied the CHANCELLOR, who was one of the most fiery and outrageous politicians of the Union, for having now to preside over an assembly where no one takes any interest in anything. The reputation of the Union speakers of that great time has always stimulated the debaters of succeeding generations, and thus the Union speakers have enjoyed the double advantage of addressing an audience that wished to see an ancient fame maintained, and that could be readily transported with the facile enthusiasm of prejudice. The bulk of undergraduates have generally kept away from the debates either because they found the process of listening dreary beyond endurance, or because they regarded discussions as idle which were to be closed by the voting of youthful partisans. Study or amusement, too, occupies a large portion of the thoughts and time of young men, and it is only in a very limited sense that study can be said to be fostered or amusement provided by the Union debates. Those, however, who, from a natural aptitude for speaking, or with a private view to their own subsequent advancement, took a leading part in the debates were amply rewarded. They were training themselves in a school of public speaking, and in many respects the school was a very good one. They had to get up a subject with some care; they had to face a hostile or captivate an approving audience; they acquired fluency, and they attained some knowledge of the chief secret of oratory—the art of expanding, for the sake of an audience, a proposition or sentiment which the speaker knows might be compressed in a very few words. They also, as Mr. CARDWELL in his speech justly pointed out, learnt to command their tempers, and control themselves into a precarious and fugitive civility towards rivals or adversaries. But the greatest of all the gains which accrued to them was that they thus acquired in early life the habit of listening with patience to the speeches of other people. The great drawback to all forms of life in which public speaking plays a principal part is the intolerable weariness of having to listen hour after hour to speeches when the hearer foresees throughout exactly what the speaker is going to say and how he is going to say it. To overcome the weariness and dislike which this fatal foresight engenders is one of the first conditions of success in public life. The lawyer or member of Parliament who desires to shine finds the acquisition of this power of endurance as indispensable as the noble savage finds the acquisition of the art of wearing trousers and a tall hat if he wishes to share in the blessings of civilization. And it cannot be denied that the Union offers an excellent school in this respect. The young gentlemen who speak are generally the same, and their fancies, their principles, and their delivery are perfectly familiar to all around them, while the impatient orator can, as a rule, speak but once in an evening, and the pains of a listener rather than the pleasures of a speaker fill up the bulk of his time.

The speakers at the Jubilee meeting found much to say about Oxford, but not much to say about the Union. There was in fact very little to say about it, except to recount the glories which gave it lustre forty years ago, and to insist that it helped young men to speak in public. Its advantages appear most obvious to those who feel sure that they will get an opportunity of speaking in public, and young men to whom birth or wealth gives a reasonable certainty of entering Parliament at an early age see the rewards of a Union training most distinctly before them. It is not therefore wonderful that among old Union speakers there should be many whom the chances of life have wafted into early distinction or notoriety; and the fact that what was sure to happen had happened afforded a pleasant theme to most of the Jubilee speakers who cared to touch on the Union at all. Not but that some of the speakers did their utmost to bring in the Union at any hazard, and Mr. GOSCHEN, more especially, in returning thanks for the navy, managed to connect his remote subject with the debating society of which he felt bound to speak, by dwelling on the interesting fact that during the fifty years celebrated by the Jubilee the Union had never once taken the navy as a subject of

discussion. Some of the remarks made during the course of the evening on Oxford as apart from its debating society were not without interest, and especially those of the Archbishop of CANTERBURY and Lord SALISBURY. But the simple thought that seems to have occurred to most of the speakers was that, just as the best Union speakers had in many instances become distinguished public speakers, so too many Oxford undergraduates of all kinds had been distinguished in various ways; and the ATTORNEY-GENERAL made a very successful speech while proving in graceful and spirited language the truth of a proposition so gratifying to his hearers. If the Cambridge Union in its turn thinks fit to hold a Jubilee or any festival to which it likes to give a name, a Cambridge speaker will find it equally easy to show that many distinguished men of recent days have been educated at Cambridge. To make the most natural things seem wonderful when an audience feels pleasure in believing them to be extraordinary is a legitimate stroke of after-dinner oratory. But if there is anything wonderful in the matter at all, it is not that many of the leading men of the day should have been trained at Universities which offer enormous rewards for intellectual excellence, for which all the public schools are nurseries, and which have been for centuries connected with the learned and aristocratic classes. It is that there should be so many leading men of the day who have not been trained in these favoured institutions. Lord SALISBURY, in attempting to account for the fact that Mr. GATHORNE HARDY, an old Oxford man, has established a reputation as a public speaker although he never took part in the Union debates, playfully suggested that it must be Mr. GATHORNE HARDY's "innate genius" that had done it. Perhaps this may be the explanation of the success of non-University men; and the nation at large may feel satisfaction at thinking that, apart from its two old Universities, it has seen several schools of training produce men of as much innate genius as Mr. HARDY.

MR. BRIGHT AND THE EDUCATION ACT.

MR. BRIGHT'S speech at Birmingham is the speech of a man who is accustomed to be frank, and is accustomed at the same time to measure his words. It is in this double light that what he said upon the Education question must be read. The disposition both of the avowed opponents of the Government and of its discontented supporters will be to make a great deal of Mr. BRIGHT's condemnation of the Act of 1870. And certainly there is something strange in hearing a Cabinet Minister speaking of a measure framed by his colleagues as giving just offence to the Nonconformists, as embodying an evil principle and one that should not be continued, as making an attempt at educating the people in a way which it is not possible to render truly national or truly good. But the peculiar relation in which Mr. BRIGHT stands to the Education Act must be considered before the force of these phrases can be accurately estimated. Had he now entered the Cabinet for the first time, we do not think that he would have thought it necessary to be so open in his censure of the Education Act. A man who joins a Ministry is naturally disposed to dwell on his present agreement with it rather than on past disagreements. But Mr. BRIGHT was nominally a Minister when the Education Act was before Parliament, and he has been charged with inconsistency because he has condemned a measure in which it was assumed he must have had a hand. From this charge Mr. BRIGHT was anxious to clear himself. The fact that during the Session of 1870 he was not only too ill to take his place in the House of Commons or in Cabinet Councils, but also too ill to read the reports of the debates, or even to hear them read to him, enables him to do so completely. Whether under these circumstances he was well advised in remaining a member of the Government is another question, though in answering it it must be remembered that he did so to please his colleagues, not himself; but, whatever may be thought upon this point, it is impossible to fix him with any real responsibility for a statute the contents of which he never knew till after it had been passed. This natural anxiety to dissociate himself from the Education Act was just the feeling which would lead him to say all the harm of it that he could; and now that this harm has been said, it is equally natural that politicians who wish to see the education policy of the Government reversed, and politicians who wish to make the Government

suspected of an intention to reverse its educational policy, should quote Mr. BRIGHT as a witness on their side.

Those who really care to forecast what is likely to be the Ministerial line on the question will prefer to consider, not what meaning they would like Mr. BRIGHT's words to bear, but what meaning they necessarily must bear. Speaking where and to whom he did, he would be sure to go as far as possible in the direction which his hearers wished him to take. Speaking when and in the character he did, he would be sure to have weighed his words, and to intend them to convey nothing more than the minimum of significance which they will fairly carry. Mr. BRIGHT described the Education Act quite fairly when he called it "a Bill to encourage Denominational education, and, where that was impossible, to establish Board schools." This he holds to have been a wrong order of effort. It ought, in his opinion, "to have been a Bill to establish Board schools, and to offer inducements to those who were connected with Denominational schools to bring them under the control of the Board." This declaration shows, no doubt, that Mr. BRIGHT is opposed to the leading principle of the Act. But even if he had said nothing further, it would by no means follow that he wishes to see this principle reversed. Even Conservatives who object to Liberal legislation do not usually propose to abrogate it. They say that such or such a Bill did such or such a thing in such or such a way, whereas it ought to have done something else in a different way; but they do not insist upon undoing what has been done. A responsibility which does not fall upon a Conservative Minister with respect to the former measures of his opponents cannot be laid upon a Liberal Minister with respect to the former measures of his colleagues. No opposition could be more determined than that offered by Mr. GLADSTONE to the Ecclesiastical Titles Act or to the Divorce Act. But he has not attempted to repeal the latter, or refused to sit in the same Cabinet with the statesman who defended the former. In this case, however, we are not left to mere inference as the foundation of our opinion as to Mr. BRIGHT's meaning. He said distinctly that the question "whether we are on the right track for a general sound public education for our children under the Denominational system or not must be left to further proof." Mr. BRIGHT thinks we are on the wrong track, and that experience will prove that we are on the wrong track. There are multitudes, he admits, who think we are on the right track, and that experience will prove that we are on the right track. Only time can show which of these two views is the true one. This is not the language of a man who intends to propose, much less to insist, that the educational policy of the Government shall be reversed. On the contrary, it is the language of a man who, while regretting that the experiment should have taken a particular shape, yet recognizes that the trial must be carried through now it has once been begun, and is willing to abide by the result. What he says comes after all to nothing more than this—that he thinks the Government took up the subject by the wrong end, and that "further experience and something like failure will before long force on Parliament a general reconsideration of the question." No reasonable advocate of the Education Act will quarrel with this way of stating the case. The Government had to make their choice in 1870 between, on the one hand, taking the existing system as their starting point and making provision for new schools where the voluntary schools failed to do the work, and, on the other hand, creating new schools universally and leaving the voluntary schools to get along as they best could. There was much to be said in favour of each alternative; and even those who hold that the Government were right in adopting the former may admit that the question was not free from doubt, and that, if it should turn out that the solution preferred was not the best, the ground will have to be gone over again. The strongest conviction that a particular policy will succeed is quite compatible with a confession that if it should fail it must be changed. Mr. BRIGHT leaves it to be decided by "further proof" whether his view or that of the multitudes who differ from him is the true one; and it will imply some secret distrust of their own conclusion if any of those multitudes quarrel with the test he proposes.

Upon the particular question what is to be done with the 25th Clause Mr. BRIGHT is exceedingly guarded. He says, in fact, two things, with one of which every friend of education will agree, while with the other every friend of education would be glad to agree. The first is, that it is desirable for

every party that something rather more like harmony should be introduced into the public action on the Education question. That is a statement not to be disputed. There is no one who really cares about elementary education but must be sick of the controversy about the 25th Clause. It turns up on every possible occasion, and absorbs the attention which ought to be given to more important subjects. Instead of discussing how all the children in the country are to be educated, half our time is spent in discussing who is to pay for the education of a certain small fraction of these children. Here and there local politicians who have talked themselves into a passion upon this question may close their ears to every suggestion of compromise, but Mr. BRIGHT is altogether in the right when he says that there are many "worthy and honourable men" on the Conservative side of the House of Commons, and, we believe, in the Conservative party out of doors, "who would be very glad to have some arrangement come to with respect to the clause." Unfortunately Mr. BRIGHT's other point is surrounded with more uncertainty. "I believe," he says, "there is a mode, and a simple and just mode, by which everything may be done—doing harm to nobody—that is now proposed to be done by the 25th Clause, and that clause might be absolutely repealed." As to this, all that need be said is that, if Mr. BRIGHT has a suggestion of this kind to make, he need not fear that either the Cabinet or Parliament or the country will be slow to welcome it. So many people before Mr. BRIGHT have thought the same thing, and found their proposal unacceptable to some section or other of those interested in the controversy, that we are not sanguine as to his success proving equal to his own expectations. But if he can point out a way in which the 25th Clause can be banished from the Act without either bearing hardly on indigent parents, or subjecting voluntary schools to a special tax, or saddling the ratepayers with a burden greater than they can bear, or at all events than they are likely to submit to, he will have earned the gratitude of all parties.

ARCHBISHOP MANNING ON THE POPE'S LETTER.

ARCHBISHOP MANNING'S defence of the POPE'S letter to the German EMPEROR will have much the same effect as the original document. His argument will be conclusive to those who are already convinced; and it will have no influence on opponents or on neutrals. The present policy of the German Government by no means commands universal assent in England; and if it had not been adopted by a Minister reputed to be the most sagacious of living statesmen, it would be generally condemned as impolitic. More than one generation has passed since it was thought prudent or justifiable for an English Government to engage in a serious conflict with any religious body; and the capricious exception to the established rule which was constituted by the absurd Ecclesiastical Titles Bill resulted in immediate failure and final retraction. It is commonly held that all lay and clerical bodies are entitled to cultivate any religious opinions which they may prefer; and experience has at least proved that it is judicious to tolerate heresies which cannot be suppressed. It is true that the doctrines which have of late years been associated in the United Kingdom with disaffection have been held by communities voluntarily organized. Prince BISMARCK, on the other hand, is engaged in a contest with an Established Church which holds its privileges and possessions on certain understood conditions. That the EMPEROR disclaims any possessive relation to the POPE is a fact which has no bearing on the position of the Roman Catholic Church in the kingdom of Prussia. In the Rhine provinces and in Prussian Poland the Church retains by law, or sometimes by treaty, the position which it held when those provinces were originally annexed to the monarchy. Although there have been occasional disputes, the Prussian Government has for the most part been on friendly terms with the POPE, who indeed recalls with regret the tone of the letters which he formerly received from the KING. The legislative and administrative measures which have lately been directed against the Roman Catholic clergy are founded on the assumption that they have themselves violated their express or implied contract with the State. The prosecution of SACHEVERELL offers a nearer analogy to the recent proceedings than the enactment or enforcement of the penal laws. The House of Commons was then defeated; and the early Hanoverian Kings were too weak or too indifferent to pursue a policy of interference with the Jacobite clergy, even if it had been pos-

sible to allege or to prove that their antipathy to the Whigs was connected with any heterodox theory.

If Archbishop MANNING desired to enlist English feelings or prejudices on the side of the persecuted German Church, he ought to have relied on the commonplaces of Liberalism, and to have contended that the points in dispute belong exclusively to the theological domain. The infallibility of the POPE, whether it is a divine dogma or an impudent fiction, is a proposition of the supernatural or supermundane order; nor has it ever been apparent to impartial Protestants why the doctrine should trouble or concern any but those who are required to profess to believe it. If the Prussian Government denies that the Church which it has recognized held the new doctrine, the Roman Catholic clergy may reply that anything which a General Council may at any time pronounce is implicitly a part of the creed of the Church. It would be highly imprudent for a secular Government to engage in the controversy, with which divines may legitimately amuse their leisure, whether the Council of the Vatican was regular and Ecumenical. The real question is, whether the Church has lost its identity by adding one more straw to the load of the orthodox camel. Since every bishop in the Roman communion, with ninety-nine hundredths of the clergy and the vast majority of the laity, have, for reasons of their own, accepted the Vatican decrees, it is a waste of time for schismatic politicians to inquire into the soundness of their judgment. A protest against novelties introduced by successive Popes is tacitly involved in the denomination of Protestants. The dislike of the POPE and his clergy to the consolidation of the German Empire has no connexion with the dogma of infallibility, except by accidental coincidence in time. It is well known that zealous Roman Catholics in all parts of Europe, except in Germany itself, would have approved of the French declaration of war in 1870 if only it had been justified by success. It was nothing to the POPE or to the clergy that a wicked and wanton aggression had been committed against a heretic Government which was rapidly extending its power over Catholic populations. Prussian and German statesmen have every right to resent the unpatriotic policy of the clergy; but infallibility is out of their sphere. If Prince BISMARCK ultimately prevails, he may possibly have conferred a benefit on the Church as well as on the State; but it is doubtful whether he is consistent in prosecuting bishops for issuing excommunications without the consent of the civil power. It is the duty of the Government to take care that exclusion from the Church shall involve no civil disability; but the cases in which spiritual censures can conflict with temporal laws, though not inconceivable, are necessarily rare. Whether excommunication is justified in any particular case is a question beyond the competence of unassisted reason. No Southern intellect has ever comprehended the niceties of discipline which in Scotland separate religious bodies notwithstanding perfect unity of doctrine. Whether the sacraments ought to be refused to a penitent who thinks the POPE capable of error can only be known to theologians.

Archbishop MANNING ventures on uncertain ground when he affirms the absolute right of bishops to conduct the entire education of students destined for the priesthood. Every Catholic, as he mysteriously asserts, knows that a priest cannot without imminent danger be trained amongst laymen. In the days when the Church really controlled society the Catholic hierarchy was less squeamish. To the majority of Englishmen it seems that a distinct and secluded education is inherently vicious, and that no man can be fit to be a clergyman unless he has lived amongst laymen. A Roman Catholic prelate is of course at liberty to hold the modern doctrine, and in England, as in Ireland, he may enforce his principles without interference. It is not equally obvious that a Government is not entitled to require from the functionaries of an Established Church the possession of a certain amount of secular knowledge, and the guarantee which is furnished by a course of rational training. In spite of Liberal generalizations, no prudent Government will tolerate systematic disaffection on the part of an established hierarchy. It is fitting and proper that clerical students should learn, by intercourse with their equals, to be good subjects and German patriots before they are cooped up in seminaries to be fed with orthodox dogmas. In a country where the humblest servant of the State is required to undergo a special education, it seems reasonable that some similar condition should be imposed on the assumption of the clerical office. Where the clergy are

charged with the duty of registration, it is still more necessary that they should be subject to the supervision of secular authority. The indefeasible right of appealing to the POPE has always been largely modified in practice; but as long as the supreme judgment is, except for spiritual purposes, wholly inoperative, it seems inexpedient to restrict the communications between the bishops and the POPE. In the past ages of faith Englishmen almost unanimously opposed all direct exercise of Papal jurisdiction in their own country; but Archbishop MANNING addresses votaries who are infinitely more remote than Protestants from the faith of Englishmen under the PLANTAGENET Kings. It is true that he delicately compares the Emperor WILLIAM to the founder of the dynasty, although Prince BISMARCK and his sovereign are extremely unlikely either to murder the Archbishop of POSEN in his cathedral, or to submit to the subsequent penance which was inflicted on HENRY II. It was not necessary to vindicate before a sympathetic audience the sanctimonious acrimony of the POPE's letter, or the affronts to his august correspondent which probably formed the main purpose of the communication. In this instance PIUS IX. has condescended to borrow a form of insult from his own subordinates in Austria. Some years ago the Austrian prelates petitioned the EMPEROR to disregard a law which had been regularly passed by the Council of the Empire. The affectation of regarding an erring Monarch as an unwilling victim of his Parliament or his Ministers has been eagerly adopted by the POPE. To Englishmen the constitutional unity of a Government is at least as familiar a doctrine as any dogma can appear to a Roman Catholic divine. It is natural that the POPE, bred under a despotism, and himself a despot, should be incapable of understanding the conditions of political organization; but Archbishop MANNING can scarcely assume the existence of similar ignorance among his countrymen. His speech was probably intended rather to furnish his own co-religionists with plausible grounds of apology for the POPE than to influence the judgment of Protestants. English public opinion, even if it were wholly favourable to the German prelacy, would have no effect on the policy of Prussia. In this conflict, even more than in ordinary political struggles, it will be found that nothing succeeds like success. If Prince BISMARCK should ultimately be defeated, or if the Roman Catholics of the Kingdom and of the Empire became permanently disaffected, his present policy will be condemned by posterity on other grounds than those which are assumed by the POPE and the Archbishop.

POLITICAL PORTENTS.

NOW that the spell of defeat which seemed to lie on the Ministerialists has been broken by the Bath and Taunton elections, the return of a Conservative in the place of a Liberal for Hull has lost much of the significance which it might otherwise have possessed. What made things look so black for the Ministry was, not so much that they were losing votes, as that they seemed to be repudiated with one consent all over the country. With such a majority as Mr. GLADSTONE still possesses, the losses of isolated elections count for little in themselves. It is only as an indication of the feeling of the country at large, as a forecast of a general election, that they are important. Nothing could be more absurd than the resolution attributed to the Government of staking a dissolution on the result of the Taunton election; but a defeat at Bath or Taunton would certainly have given a more serious aspect to the defeat at Hull. There would have been something ominous in the unbroken continuity of disaster, and the Ministry could not have ignored the apparent agreement of constituencies in uniformly rejecting Ministerial candidates wherever they appeared. It is true that what are called the Liberal victories are victories of a negative character. A general is hardly entitled to assume a very triumphant air merely because his guns and baggage have not been captured by the enemy; and the Liberals may be thankful that they have not lost a couple of seats which they already held without being too boastful about it. If the Bath and Taunton elections show that there was no general reaction against the Government, the Hull election would seem to show that, on the other hand, there has been no general reaction in its favour. A good deal probably turned on local influence at Hull, and in this respect the Conservatives had much the stronger candidate. Mr. FRANK is the head of an old and highly-

esteemed banking-house in the town. Mr. REED, although he is the manager of a shipbuilding Company which has lately been established there, is a comparative stranger to the constituency. Besides, Mr. REED is not exactly the sort of candidate whom the Liberals, or any political party, could be expected to feel very enthusiastic about. Before the vacancy occurred at Hull he had been courting Pembroke, with promises of shipbuilding enterprise; and he has been at little pains to conceal that he thinks it a pity that a professional critic of the Admiralty should not be at liberty to take sides in the House of Commons just as may happen to suit the particular line of naval policy in which he is interested at the moment. Mr. REED has views about shipbuilding which he is naturally anxious to enforce, and hitherto those views have identified him rather with the Opposition than with the Government. It is just possible, too, that Mr. REED's advocacy of high freeboard may have been distasteful to a shipping community which would seem to be anxious to dispense, as regards its own ships, with freeboard altogether, except in the form of deck loads.

There is a pathetic dramatic interest in the announcement that Sir GEORGE GREY does not intend to contest Morpeth at the next election, and that Mr. BURT, the Secretary of the Northumberland Miners' Association, will probably be his successor. The last of the Whigs disappears in order to make way for the first so-called working-man member. Mr. BURT is said to have been originally a working pitman. He is "a Temperance reformer, a co-operator," and the leader of the Trade-Unionists of the district. The latest Reform Act is understood to have given the miners an overwhelming majority in Morpeth, and political harmony has been secured among them by the discipline of the Union. It is probable, therefore, that Mr. BURT will be returned; but the fact that he began life as a labouring man will not make him an unprecedented phenomenon in the House of Commons. Although he is called a working-man candidate, he has really ceased to be a working-man; and he will find in Parliament others there who have similarly raised themselves from a humble position. Sir GEORGE GREY pleads ill-health as a reason for not continuing to undertake duties which are now beyond his strength; but it may perhaps be not uncharitably conjectured that he is also reluctant to expose himself to a defeat, and especially at the hands of such an opponent. Family ties and hereditary temperament rendered it impossible that Sir GEORGE GREY should be other than a Whig of the purest type—an aristocrat in spirit, but with a logical prepossession in favour of a select number of democratic principles in a qualified form. In the sect into which he was born domestic affection has always been as strong as political sympathy; and as soon as Sir GEORGE GREY entered public life he seemed to have an hereditary place in every Liberal Administration. He has always been one of the most consistent and characteristic of the Whigs, though he has never distinguished himself either as a speaker or administrator. He has been twice Colonial Secretary and thrice Home Secretary; but his most appropriate office was probably the Duchy of Lancaster. At the Home Office, in which for many years he seemed to be almost domesticated, he was a master of technical routine, and a prompt and industrious man of business; but he wanted breadth and decision of character for the larger functions of the department. Since the death of Lord PALMERSTON, Sir GEORGE GREY has been gradually passing into the background of politics. It must have been a continual and painful struggle for him to keep pace with the heroic moods of an inspired leader, and for some time he has been visibly lagging in the rear. He has none of the impulsive elasticity which enabled Mr. Lowe to head the attack on the Reform Bill, and then to take his place in the Government which it carried into power. In what may be called the private life of the House of Commons Sir GEORGE GREY has always occupied an honourable and useful place. His wide Ministerial experience and long service in the House made him an authority on questions of precedent and procedure, and when he retires from Parliament the SPEAKER will lose a valuable adviser. The revival of the rumour that Mr. BOUVIER is to have an office or a peerage, or both, would seem to be another mark of the effacement of the Whigs. If a third party had been possible, Mr. BOUVIER would naturally have been found among its leaders; but if it is true—and a speech that he made at the close of last Session might seem to countenance the supposition—that Mr. BOUVIER is about to become a colleague of Mr. GLADSTONE, it must be assumed

that the immediate prospects of a moderate balancing party are not thought to be very encouraging.

There has of late been a remarkable fatality among members of the House of Commons or peers whose eldest sons have seats in it, but it is probable that there may not be so many vacancies to be filled up during the next few months. In any case such elections as may occur will not be likely to excite so much interest as those which have recently taken place. There is no longer any question for the present either of an early meeting of Parliament or of a dissolution. It may be assumed that the next Session will not begin before the usual time, and that the dissolution will not take place before next autumn, or possibly even the year after, unless the Government is compelled to appeal to the country by being placed in a decisive minority. All this tends to calm political feeling and to allay party zeal. Isolated elections really prove very little either one way or the other, and they also go for little in making up a majority. The result of the general election, whenever it comes, will depend very little on the number of seats which may in the meanwhile be snatched from the Liberals by their opponents, but will depend a great deal on the behaviour of the Government and the proposals which it has to offer as a reason for keeping it in office. Just now the irritation which was felt at the astounding administrative blundering of the Ministry, and the tensing character of much of their policy, has been smoothed down; but it would take very little to revive it. A repetition of the same causes would produce the same results; and the important question is whether the Government will fall into a repetition of this kind, or will be able to strike out a new and happier course for itself. But, as Mr. BRIGHT said, there are no Cabinet secrets till November, and it may even be some time before the Cabinet knows its own secrets. The assumption that Mr. BRIGHT's declarations on the Education and other questions will attach the Radical and Nonconformist mutineers in permanent loyalty to the body of the party is probably somewhat hasty, and based on an imperfect appreciation of the real origin of the recent schism. The peculiarity of the advanced politicians below the gangway is that they are all deeply impressed with their own qualifications for taking a prominent part in guiding the destinies of the country. It is a regiment of generals, each of whom claims to be commander-in-chief on a particular question. If Mr. FORSTER had yielded in the first instance to the dictation of the Nonconformists, Mr. DIXON would have lost an opportunity of distinguishing himself as the leader of a party; and it is just possible that Mr. DIXON may not be disposed to subside into the ranks merely because Mr. BRIGHT has returned to the Cabinet. Human nature cannot be left altogether out of account in political speculation, and the position which has already been taken up by this section of Mr. GLADSTONE's followers is sufficiently indicative of their personal aspirations, and of the difficulty which may be found in steadying their allegiance. If, after what has been said, the Government hesitates to adopt the programme which they have sketched out for it, they will naturally be indignant; and, on the other hand, if the Government accepts their guidance, it will be thought ungrateful if it does not reward their services.

THE EMOTIONAL LANGUAGE OF THE FUTURE.

MR. SPENCER recently called attention, in a very interesting passage of his *Psychology*, to those secondary signs of a feeling which are to be found in abortive attempts to conceal it. "A state of *mauvaise honte*," he well says, "otherwise tolerably well concealed, is indicated by an obvious difficulty in finding fit positions for the hands." A great mental agitation, though prevented from breaking out into violent expression, is pretty certain to betray itself in the awkward, shuffling movements which are made to curb and suppress it. Such indirect signs of emotion Mr. Spencer calls its secondary natural language.

The fact that many of our emotions now betray themselves only through the incompleteness of the effort of will to disguise them is not a little curious, and offers several lines of interesting inquiry. It at once suggests how very little play for emotional expression the conditions of modern society appear to allow. For it seems tolerably certain that the voluntary hiding of feeling is a late attainment in human development, and is forced on us simply by the needs of advancing civilization. Savages for the most part know little of concealing their passions, and this makes them so good a psychological study. Children, too, who may be supposed to represent the earlier acquisitions of the race, are proverbially unfettered in the expression of their sentiments. In like manner, in the various ranks of our civilized society we see that, while a cultivated lady appears to

all distant onlookers to have a mind dispassionate and undisturbed by agitating feelings, a West-country maid reveals her curiosity and wonder, her alternations of joy and misery, with scarcely a trace of compunction. If we go low enough down the social scale we find the freest utterance of feelings, and it is only when, in retracing our steps, we arrive at a certain stage of culture that we discover signs of an active emotional restraint. Where this self-control is defective we have Mr. Spencer's secondary emotional signs. Higher up, among a few specially cultivated persons, the acquisition of this power of concealment appears to be complete, and we have a type of mind capable of a prolonged external serenity unruffled by a gust of passionate impulse. The survey of these facts at once prompts the question whether the expression of our feelings by smile, vocal changes, and so on, is destined to disappear with a farther advance of social organization. To attempt to answer such a question directly and briefly would perhaps betray too much confidence. We may, however, seek to define the various paths of inquiry to be pursued before a final answer can be arrived at, and to hint at the probabilities of the problem under its various aspects.

First of all, then, with respect to the distinctly unsocial feelings, the answer seems to be tolerably clear. It being generally allowed by biologists that the looks and gestures accompanying anger, jealousy, and pride are simply survivals of hostile actions, the nascent removal of an attitude preliminary to attack, it is natural that they should appear only in transitions of society from a barbaric to a civilized condition. When the age of destructive conflict, individual and racial, shall have become the curious research of antiquaries, it may be presumed that any bodily movements known to have grown out of these struggles will cease from sheer desuetude. Indeed one may perhaps, without too optimistic a bias, refer to the fact that all the stronger manifestations of anger and malice have already become unfamiliar in real life, so that when we see their imitations on the stage they are apt to appear ridiculously forced. The better part of modern society has put such a ban on the ugly signs of rage that our only means of discovering traces of this passion in a man is some incompletely suppressed emotional movement, or some too violent effort to command the muscles of expression. After many more generations shall have practised the difficult art of noiselessly crushing out with the foot an incipient wrath, it will be hard if such offences to the eye as frowning brow and scornful mouth do not entirely disappear.

But the progress of social refinement probably affects other expressions than those of the distinctly hostile sentiments. It tends to confine within ever narrower limits all manifestations of unpleasant feeling. Since it is a grateful thing to witness pleasurable feeling, and painful to see the expression of suffering in another, a polite form of society does all it can to encourage the one and to suppress the other. A man is for the most part supposed to be able to obtain all needed sympathy in his troubles from his family and his intimate friends. Before the rest of the world he is expected to hide his grief and maintain a cheerful aspect. It is one of the delicate forms of sensibility produced by a high culture to be fearful of obtruding one's feelings on unconcerned onlookers. This growing perception of the vulgar aspects of uncontrolled emotional display appears to have much to do with the partial concealments of feeling of which Mr. Spencer speaks. But comparatively few persons are completely able to hide a sharp and sudden vexation, however public the occasion of experiencing it. An annoying piece of intelligence, affecting it may be one's matrimonial chances or equally dear ambitions, will very likely call up a momentary expression of dismay even in presence of a fashionable company. We wonder to how many persons it is still a necessity under the smart of a sudden disappointment to flee as soon as possible from all spectators, and relieve the pressure of emotion by a few energetic expletives, if not a sparse shower of tears. We do not know how many ages it may require to discipline our species in a perfect concealment of painful feeling; but at present it looks as though we were passing through the hardest stages of this schooling.

One other influence which probably contributes to make emotion more and more private and invisible is the partial revival of the Stoical doctrine that all sentiment is a moral weakness. This idea appears to hold most sway in our own country, and especially among those classes who are most concerned to maintain a not too obvious gentility. A common supposition among young aspirants to social rank seems to be that lofty breeding is best seen in a uniformly passionless and vacuous arrangement of the facial muscles. To appear interested in any object in his environment strikes the pseudo-aristocrat as a pitiable infirmity of vulgar minds. The ways in which this curious self-imposed check acts are at times very funny. We remember hearing Macready give a series of readings to a fashionably dressed assembly in a small provincial town, and we were much struck by the almost heroic efforts which many of the company made to conceal the emotion so powerfully aroused by the tragedian's art. Possibly English people are less impressible by scenic display and music than Continental nations. Whether this be so or not, it is very curious to contrast the perfectly apathetic aspect of an assembly at Covent Garden with the lively demonstrations of an audience at a Paris opera, or the deep earnest absorption of the worshippers of Wagner at Berlin or Munich. This notion that it is the final attainment of civilization to appear impassively indifferent to everything about one, and constantly to preserve the serenity of an equanimity which knows nothing of the agitation of pleasure or pain, may be expected to give the last touch of refinement to emotional expression.

If these were all the facts bearing on the future of our emotional life, we might well inquire what effect the habitual suppression of emotional expression is likely to have on the quality of the emotions themselves. It is probably clear to everybody that our feelings are very much affected by the range of free expression accorded them. At least the violent intensity of a passion is destroyed by successful control of all the muscles, and, even if a slow smouldering fire of hate or jealousy may coexist with a comparatively quiet exterior, the emotional force is in this case robbed of its glory. It would thus appear that with social progress, as men are thrown more and more in each other's society, their feelings will undergo a very considerable transformation; some types of emotion disappearing it may be altogether, the rest being so mollified as to be scarcely recognizable as the venerable forms of human love, terror, and joy. But, oddly enough, we find another set of influences, due to the very same social conditions as the first, which tends to counteract these, fostering and deepening feeling, and encouraging its manifestations. Mr. Spencer thinks that the habit of expressing pleasure and pain arose as animals became gregarious. This condition exposed the members of the same flock to common experiences of danger, &c.; and in this way, from uttering the sounds of terror under like circumstances and at the same times, they would come to interpret them when given forth by their companions. At the same time the gregarious mode of life clearly made animals able to assist one another in a large variety of ways. Now on this supposition, which seems extremely plausible, the habit of expressing feeling is an attainment of social life, and, so far from disappearing with the advance of this life, it should, one would think, go on developing. In point of fact, we see in a number of ways how social progress serves to enlarge the area of sympathetic feeling. As a man becomes more of a citizen, he is probably more and more desirous to be in unison of feeling and intention with his fellow-citizens, at least with that section of them whom he most respects. The sympathy he looks for presupposes, it is clear, some expression of his own feelings, and a responsive expression on the part of his neighbours. In this way, then, there are two tendencies of social culture curiously conflicting in their results. By virtue of the one a man seeks to repress feeling and not to obtrude it unnecessarily on his fellow-citizens. By force of the other he is ever craving with more and more vigour for a lively interchange of sentiments with others. What resultant, it may be asked, do these opposite forces produce?

Without trying to determine the precise direction of this compound effect, it may be just suggested that a kind of compromise between the opposing forces is frequently effected by means of language. By this medium we may convey most minutely and accurately the fact of a feeling and define its nature, without bringing it forward as a vivid and naked reality. It is highly disagreeable to see a look of disgust in another's face, but we do not quite so strongly object to a man's telling us the cause of such a feeling and leaving us to imagine by inference the nature of the emotion itself. Language, while defining the precise variety of sentiment, contains also in its ever-varying modulation of voice, its changes of pitch, intensity, and *timbre*, a large apparatus of proper emotional expression. Moreover it seems fully allowable to accompany speech with a variety of other emotional signs which are looked on as silly and weak if presented independently. We rather expect conversation to be brightened by the many subtle changes of the facial muscles and the refined and subdued gestures peculiar to our nation. If a person habitually wears a half giggle, we are probably struck by the imbecility of this meaningless display. So too when a man meets us in the street looking evidently soured and retaliative, we rather wish he would reserve these unamiable exhibitions for his sympathetic friends. We have, in a word, grown intellectual much faster than we have become emotional, and we cannot suffer feeling to exhibit itself without some explanation of its nature and causes being offered at the same time. If a man will unbosom to us his sorrow or his joy fully and intelligibly, we profess ourselves willing, provided he is not too wearisome and exacting, to lend him a patient ear and to endeavour to enter into his peculiar experiences; but without this explanatory recital, the evidences of feeling are apt to appear unmeaning, if not actually offensive.

We may just point to another influence which still further complicates this question of emotional expression--namely, the growing demands made by social refinement on the expression of kindly interest in other people's concerns. While a man is judged to be inconsiderate if he is frequently intruding his personal feelings in social intercourse, rigid politeness requires us for the most part to lend an appreciative ear to the tale of woe, however dull it may happen to prove. This law calls into existence a very curious group of half-artificial expressions. The degree to which polite persons have nowadays to assume feeling may well alarm any one who cares much for the honesty of social intercourse. We all know probably the drawing-room smile of some of our lady friends. It is something quite unique, never appearing in other places and at other times, but presenting itself at the right moment with all the certainty of an astronomical phenomenon. So too we know persons whose voices undergo a most curious change when called on to converse with a stranger, especially one of the opposite sex. No doubt some slight part of the display may be set down to an unavoidable excitement, but the main features of it would seem to be deliberately assumed. In this way it appears that, owing to the requirements of modern society, our volitions are called upon now to check feeling, now to force it into play. The studied graces of smile, dilating eye, and mellifluous

voice, make up a perfectly new order of quasi-expressions, which might perhaps in a highly artificial state of society gradually supplant many of the older and familiar forms of emotional utterance. Whether the agencies which tend to sustain genuine emotional expression will prove to have more vitality than those which go to suppress it, and how far, supposing spontaneous utterances of emotion to grow out of date, artificial limitations of them will continue in fashion, are points which we do not attempt to determine. Enough has been said perhaps to show how curiously complex are the conditions of the problem.

THE VIENNESE AND THEIR VISITORS.

NOW that the Vienna Exhibition is drawing to a close, the Viennese are beginning to take stock of the results of the season, as the hosts of an evening discuss their party before retiring, when their guests are gone. As for the Court and the politicians, we do not imagine that they attach to the Royal visits and the Court receptions any more importance than they deserve. If some of them had their significance, it was rather as regards the nation whose representative was entertained; as when the Italians were eager that their King should make a progress in Germany, by way of response to the menaces of the French Ultramontanes. The Emperor issued invitations indiscriminately to his brothers and sisters in the purple. His invitations were accepted in every instance, either by the ruling potentates or their heirs-apparent; or else they were declined with a frank courtesy which left nothing to suspect. The visits all "went off well." The Emperor received every one of his guests with the ease of a high-bred gentleman. Although he may have been most pleased to greet such intimate friends of his own as the Crown Prince of Saxony, yet his tact avoided any suspicious excess of politeness in his cordial intercourse with the victor of Sadowa or with the master of the formidable legions of Russia. On their part the guests came determined to be pleased, and prepared, it may be presumed, to endure with complacency the ceaseless round of entertainments that awaited them. Except the unfortunate Czar, who was haunted with the fear of assassination, their faces were always wreathed in smiles when they made their appearances in public. Except the Shah, whose knowledge of European languages was naturally limited, they were to be seen chatting in the most amicable manner with their Imperial host and the Archdukes. They proposed in the neatest and most appropriate turns the healths of their respective Houses at family dinners at the palaces. They wrung each other's hands warmly when they exchanged farewells, and national anthems on the departure platforms; and they ought to have carried away and left behind them impressions as agreeable as could reasonably be expected. No thoughtful man on the one side or the other could ever have hoped for anything more; and when there is a difficulty next time about the Danubian provinces, or the Poles, or the frontier in Schleswick, recollections of "those pleasant days we passed at Vienna" may be trusted to do at least as much as any one could have hoped for.

But the citizens of Vienna had a more direct interest in the season being a successful one than the Sovereign who had so zealously promoted the Exhibition. Their new capital had been run up so recently that strangers had hardly had time to find it out, and, indeed, some of its most imposing quarters were only then in course of construction. They had invested large sums in building and decorating, and were impatient to draw their dividends on the capital they had been sinking. What was even more serious, they had pledged their credit far more deeply than outsiders suspected, and their speculations must be made to pay pretty quickly if the bills were to be met that had been drawn so freely on the future. To these worthy people the Exhibition came as a godsend. They were profoundly impressed themselves with the dazzling magnificence of their new city. They felt that it only required to be known to be appreciated, and the International Exhibition would advertise it with the necessary *clat* to the admiration of the world. The strangers who swarmed to it would give to these vast now thoroughfares the animation in which they might possibly be somewhat deficient, when contrasted with the cheerful bustle of the older streets. And when strangers had once discovered the existence of this newly-planned paradise, of course they would return to it in subsequent years. Its happy situation on the confines of the West and the East would assure it a piquancy of its own by combining the attractions of an old world and a new one; and if all went as well as they anticipated, it would be premature to define the limits of its destinies. They showed their faith in these fond ideas of theirs by the extent of their preparations for sheltering and feeding their visitors. Hotel rose after hotel, each bigger and grander than its predecessors. Great new eating-houses and beer-cellars of showy exterior sprang up along the lines of the boulevards, to say nothing of those innumerable restaurants which were swarming their customers in the fascinating grounds of the Exhibition itself. Although the new arrivals might search in vain for accommodation that was at once cheap and comfortable, there were apartments to be let in many of the very biggest of the new houses. Whole floors had been rented on speculation, while the tenants, who withdrew to closets in their back premises, prepared to enrich themselves at the expense of their lodgers. And if the Viennese have been reckoning without their hosts, they have not been altogether the victims of circumstances and their own short-sighted covetousness. It is true that the weather as well as the inexperience of the Exhibition authorities must have told very greatly

against them. It is certain that they frightened away many of their intending visitors by plucking the earliest arrivals with suspicious indiscretion. But had the weather been everything that the devoted female lodging-house keepers who frequented the churches may have prayed for, had the citizens had self-restraint enough to show some conscience in their charges, in spite of the keen rivalry and other temptations to the contrary, still we greatly question whether the world of their visitors would have been persuaded to stall in love with their city. And if Vienna was not made attractive in the Exhibition year, it would scarcely be very popular in ordinary times.

The truth is, that the Austrian capital is little more than an overgrown provincial town which took to giving itself on a sudden the airs of a Paris. Arriving in it, you feel yourself very much in the position of the man of the world who has dropped in upon a quiet family party. He is made to feel that he is not wanted there, and he knows that he is bored. The talk about matters of general interest is hushed when he is there to listen, and there is no place for him in the innocent round-games that afford to the family all the amusement they care about. They do not even order supper up while he is there; not that they are inhospitable, but because they are afraid of inviting him to be a witness of their simple habits. Even if they have just moved into a handsome new house, it adds rather than otherwise to their embarrassment. They are oppressed themselves by the unaccustomed grandeur, painfully conscious of the contrast to their old primitive habits, and perpetually apprehensive of committing solecisms. So at Vienna the citizens led a life of their own, and outsiders were condemned to amuse themselves as they could among strangers like themselves. A solitary traveller is landed at his hotel in Paris, and whenever he steps over his threshold he finds himself at once in the full swing of Parisian life. He easily goes with the stream on the broad pavement of the brilliantly lighted boulevards that are covered with the gay crowds who are flowing over into the lively cafés. Sparkling comedies are being acted in any theatre he may drop into, and it is impossible to help laughing in sympathy with the audience, even if he should not understand a word of the language. In Paris you are welcomed into cheerful restaurants by waiters who have the air of being ready to depart in peace now that they have tasted of the exceeding felicity of attending on you. In short, whatever the influence of Paris on your moral tone, there can be no question about the effect on your spirits and impressions. Whether you confine yourself to the part of onlooker or abandon yourself to the humours of the place, you seldom find your time hang heavy. At Vienna it is just the reverse, and the comparisons you draw are all to its disadvantage. You go out of an evening to find the magnificent Ringstrasse as much of a blank as the Parisian boulevards are a bustle. The cafés in the Ring are all the creations of yesterday, and very few of the natives are to be found making themselves at home in them. The theatres are acting ponderous tragedies, or their comedy is in a patois that defies your knowledge of the language. Go into a restaurant with the idea of dining, and, except for a solitary smoker or two, belated after their early meal, you probably find yourself its only occupant. The waiters eye you resentfully as an intruder, and only consent to serve the dishes you have ordered after repeated entreaties and reiterated remonstrances. Your hours are not the hours of the place, nor in the way of amusement have you much in common with the people. Were you to dine at noon instead of seven in the evening, and make your way to one of the dark dining-rooms in the old town, you would find abundance of food being served, although for all except *habitués* the strangle is a desperate one. Should your taste incline that way, you might swallow beer till late in the night to an accompaniment of very admirable music. But although Viennese beer is the best in the world, a quart or two goes a very long way with any one but a German; and after a few weeks of doing like the Viennese, one's liver is likely to become euphonic in its remonstrances. A visitor who falls into the fashions of the city, and soaks and smokes through the livelong day, generally ends with a *détour* to the healing waters of Carlsbad. If you mix with the gay world in the Prater, you must go thither at the hour when you would naturally be sitting down to dinner. The aristocracy have disposed of their hurried repast ages before, and now they are driving and riding to get up an appetite for heavy suppers. Were you sojourning in Paris, you might live in hope of making friends with an occasional Frenchman, because there is something in common between your tastes and theirs, and nothing absolutely antipathetic in your habits. But, as a preliminary to swearing friendship with a Viennese, it would be necessary to stipulate for sacrifices on either side which no amount of mutual liking could make supportable.

This season the visitors have had more in their favour than they are likely soon to find again. Foreign enterers for amusement had preceded them—men who knew their tastes and tried their best to gratify them. The Viennese, officially and otherwise, made considerable exertions to render their stay pleasant, and got up various entertainments in their honour. When other distinctions failed, there was always the Exhibition itself to fall back upon. Although far fewer people had come to see it than had been anticipated, there was generally a chance of meeting acquaintances there. Yet, in spite of it all, the stranger never took kindly to the place. Killing the day was always more or less of an effort, and hunting about for society was a hopeless enterprise. There is no fashionable centre in the city towards which its idlers gravitate naturally; no Park, no Bois, no Boulevards, and no Place.

dilly. Coming in contact with congenial spirits in the Ring was always much more than problematical. Friends who had settled in distant hotels rarely saw each other except by accident or arrangement. If you caught a German acquaintance while out on the quest, you were sure to find that your plans for the day were at cross-purposes with his. From the hour when you arrived to the moment of your departure, effort and exertion were the rule, and *laissez-aller* altogether the exception. You had "done" the place, and you took your leave of it with little desire to return. All this may change gradually as the new city fills up from the old one, and as the natives are broken in to the fashions that are universal in capitals of the same pretensions. But it will be a work of time in any case, and in the meanwhile the inhabitants are likely to have their city almost as much to themselves as in the days before they had had the idea of rebuilding it. We suspect that the experience of the past summer has brought them to that very disagreeable conclusion, and a very black look-out it must be for those who have been speculating confidently on the contrary.

TWELVE HUNDRED YEARS OF ELY.

CONTENDING, as we always have done, that cathedrals in their original and legitimate conception are eminently practical and useful institutions, we are glad to recognize the increased popularity which is incontestably following the exertions which many of them have been making to live up to their true theory. No more significant evidence has probably been given of the hold which the cathedrals have during this generation been taking of the popular affections and imagination than that of which Ely has been witness during the last few days. It happens that exactly twelve hundred years have elapsed since a pious lady named Etheldreda, royal by birth and marriage, abandoned the rude pomps which were no doubt as precious in the eyes of an English Queen in the seventh century as our more refined luxuries are in our own, in order more efficiently to help the cause of that newly preached Gospel which was struggling all over the surface of early England against the fierce opposition of Teutonic heathendom. Etheldreda founded, under herself as abbess, a religious house for men and women on that which was then literally the Isle of Ely (Elge, as Bede calls it), a hill abruptly rising out of the dreary fens of East Anglia. This foundation, after nearly two centuries of quiet existence, was in 870 totally destroyed by the Danes, and after a while restored, first as a community of secular priests, and then, in 970, exactly a hundred years after the havoc, as a Benedictine Abbey by Athelwold, Bishop of Winchester. After the Conquest a relation of William's, Simeon, was, in his extreme old age, appointed abbot, and began with great energy the rebuilding of the church which—having been continued at various intervals all through the Middle Ages, first in Romanesque and then in the various phases of the Pointed style—has placed the Minster of Ely (especially since the noble restoration daringly undertaken by Dean Peacock, and very ably carried out by Sir Gilbert Scott) in the very first class of the most magnificent churches of Europe. Not long after the commencement of Simeon's work, the accident of the Abbey having fallen under the government of a refugee Bishop of Bangor, brought about the division of the unwieldy diocese of Lincoln and the conversion of the Abbey into a Cathedral, of which the bishop, in memory of the circumstances which led to the creation of the see, has ever since—instead of sitting, like all his compeers, on a throne—occupied the stall elsewhere devoted to the head—abbot, prior, dean, or master, as it may be—of the Abbey, Collegiate Church, or College Chapel. In the meanwhile, as at Canterbury, Durham, Winchester, and the other cathedral abbeys, the monks continued to form the governing body; and as in those cases Henry VIII. transformed the corporation into a secular chapter of the "new" foundation. These few leading facts of the long history of Ely show that, while the actual foundation as well as the actual buildings of Etheldreda passed away more than a thousand years ago, her moral work no less than her local fame has still survived with an undisputed continuity. Her object was to found an institution—church, and workers in that church—as the bulwark of religion among the Eastern English; and still among those Eastern English a church uniquely grand, and an ecclesiastical body of very illustrious heritage, from the names of which may be read on its records, have endured and seem to give the assurance that those twelve centuries find Ely Minster only in the mature vigour of strong middle life. But the church and corporation of Ely are not the only growth—we can hardly even say the only direct growth—of St. Etheldreda's forethought. Bede has a picturesque story, that when her sister and successor Soxburga wished to transfer the body of the foundress of Ely to a more fitting tomb, she sent some of the brothers of the Abbey on an expedition to find a stone larger than any which Ely could provide to make the coffin—"qui ascensu navi (ipsa enim regio Elge undique est aquis et paludibus circumdata neque lapides majores habet), venerunt ad civitatum quondam desolatam, que lingua Anglorum Grantacaestir vocatur; et mox invenerunt juxta muros civitatis locellum de marmore albo pulcherrime factum, operculo quoque similia lapidia aptissime tectum." The disciples of Etheldreda, thus finding out and turning to practical use, to the honour of their foundress, this relic of old Roman civilization and classic art hidden away in the ruins of that which is now Cambridge, reads like an unconscious prophecy. It cannot be doubted that,

whatever may have been the formal origin of the University of Cambridge, the proximity of the great house of Ely was for ages a most powerful succour to the growing school of learning. The earliest college—Peterhouse—was founded in the middle of the thirteenth century by Hugh of Balsham, Bishop of Ely, and his successors have constantly appeared among the most generous benefactors of the University, out of which they have for many centuries been most properly selected. A Cambridge man might indeed not inexcusably exclaim of Etheldreda's enterprise, when he looks from the one huge minster of Ely to the many towers of his University,

Sic fortis Etruria crevit

Selicet et rerum facta est pulcherrima Roma.

The incidents of the Ely Bissexcentenary are no less picturesque when it is viewed as a portion of wider history. Tested merely by arithmetical and prosaic considerations, an antiquity of twelve centuries is less remarkable than one of a longer time of odd years. But as Dean Merivale eloquently pointed out in his sermon, there is a roundness and completeness in that number which strangely appeals to the imagination. It was something for him to have been able to frame the couplet in which, with his fine scholarship, he recapitulated the event upon the model of that quaint but grimly grand old prophecy of the downfall of Imperial Rome—

Bissexcenteni sunt nec plus vel minus anni

Augusto augurio postquam inclita condita Roma est—

by the substitution of a second line of cheerful hope for the gloomy intimation of coming decay conveyed in the original composition. In truth, a very memorable chapter of the world's history is traversed in those twelve centuries. The theologian will note that not only was the schism between Eastern and Western Christendom an event of the unknown future in Etheldreda's days, but that not even had the sixth of those undisputed Councils, to which in turn every branch of the Christian community appeals, yet been assembled. The historian will record that about a hundred and fifty years of petty struggles had yet to be fought out before the foundation of that still existing kingdom which the official style of "Great Britain" has never prevented the world from calling England had been laid by the hard-won supremacy of Wessex, while more than a century and a quarter had to be numbered before the Christmas Day of 800 saw the Imperial dignity attaching to Rome restored to Western Europe by the crowning of the great German Charles; and a still later date had to be reached before France began to care for that family at which the administrators of a demoralized people are, in the spasms of long despair, again clutching, as the fancied talisman against chronic revolution.

But all appeals to imagination, all references to history, all theoretical gratitude to Etheldreda or Simeon or Hugh of Balsham, could not have succeeded in making a Bissexcentenary at Ely, or any other place, more than an archaeological masquerade, if the savour of life were not strong in the body which ventured on so bold a commemoration. We do not talk of the magnificent rendering of the choral services; these might have been as artistically perfect if the nave had been a sparsely sprinkled solitude. We do not dwell on the fact that a Metropolitan of Canterbury has condescended to emerge from the princely grandeur of Lambeth to lead the worship in the Cathedral of a suffragan, creditable as this is to Archbishop Tait himself. The incident to which we desire to call attention is the crowded and enthusiastic attendance which the people, of all sorts and descriptions, spontaneously contributed during the five days of the commemoration. Materially Ely Cathedral is better suited than any other of our mediæval minsters for a great popular function. The expansive central octagon, opening into transepts and nave, which the illustrious architect of the fourteenth century, Alan of Walsingham, raised on the ruins of a fallen tower, though not so spacious as the dome of St. Paul's, is even more practical for unusual gatherings; while the fact that there is no difference in level between the eastern and western branches of the church, though an architectural drawback (shared by the way by cathedrals such as Milan, Le Mans, and Chartres) is eminently conducive to the effective working of the Anglican ritual. The restoration, too, of Ely Cathedral, resolved upon and entered on about thirty years ago, when to restore a cathedral was to struggle against, and not, as now, to float with the stream, by that man of nobly simple genius, Dean Peacock, unflinchingly carried on by his accomplished successor, the present Bishop of Carlisle, and brought to a fitting conclusion by the distinguished scholar who now fills the decanal seat, and all along directed by the rare capacity of Sir Gilbert Scott, had attuned the popular mind to the appropriate use of a building so magnificently composed and so artistically renovated. Still against these material advantages had to be set the fact that Ely Minster stands in a country town of only a few thousand inhabitants, while the contingent which Cambridge—sixteen miles off—could be expected to send was one more likely to be remarkable for quality than quantity. In spite, however, of this drawback, the nave, the octagon, and the transepts (not to mention the triforium) of Ely Cathedral were without exaggeration crammed from end to end on the greater occasions by a congregation instinct all through with interest and respect for the circumstances which brought them together, and obviously including a more decided proportion of real worshippers than might have been anticipated by critical bystanders. It was popularly estimated that on Sunday evening, when the Bishop of Peterborough preached, there was a congregation of from four to five thousand persons. The numbers could not have been much less.

during the morning and afternoon repetitions of the diocesan choral festival with which on Tuesday the Bissexcenary services concluded. The spectacle of the long procession of surpliced choirs from many parishes, filling up the whole nave, with their frequent banners, and accompanied in their chant by a military band, which marched unseen on a parallel line up the triforium, was peculiarly impressive. A few years since such a ceremonial would have been simply inconceivable; now it was the offshoot of an event which Churchmen of widely different schools combined to carry out. The conclusion which we draw from the circumstance is that the cultivation of external beauty as the accessory of, and incentive to, spiritual worship is not uncongenial to the English temperament, provided only the process be carried out with that reasonable consideration for common sense, and that tactical appreciation of things as they are, which usually influence the managers of the respectable enterprises of ordinary life.

We must not forget that an additional interest was imported into the events of the Ely festivity by the fact that since its conception the sudden death of Bishop Wilberforce led to the selection of the earnest and greatly honoured Bishop Harold Browne as his successor. It accordingly added to its original scope the further characteristic of being the leave-taking between the prelate and his former diocese. We could have much to say as to this side of the ceremonial, which was equally gratifying to the Bishop who had earned the love of his flock, and of that flock who came forward to testify their affection. But we have purposely confined ourselves to the original and more general object of the Bissexcenary as a timely and successful appeal of the Cathedral system to the sympathies of the people of England, as not only one of the oldest, but in reality one of the most useful and most truly practical, of the many institutions of our complex social system. The exceptional conditions of the Ely Commemoration cannot be repeated in other cathedrals, but the lesson which these five days has brought them may well bear fruit in the more energetic, the warmer, and the more confiding co-operation of bishop and Chapter, country clergy and laity of the diocese, in the great work of Christian improvement which every cathedral, even more than every parish church, exists to accomplish. Such a demonstration as that of Ely would have been impossible at a cathedral town in which the bishop was not a resident citizen.

THE EVIDENCE ON UNSEAWORTHY SHIPS.

THE evidence which has been taken by the Royal Commission on Unseaworthy Ships has now been published in a bulky blue-book, along with their preliminary Report. The Commissioners promise another Report when they can see their way through the darkness in which they are at present enveloped; and it may be presumed that they have still a great many other witnesses to examine. Their inquiries are very interesting and instructive as far as they have gone; but they can hardly be regarded as exhaustive. If the Commission, instead of sitting in state at the Palace of Westminster, were to pay a visit to some of the seaports, and take evidence on the spot, they might possibly obtain some useful information which is otherwise not very likely to reach them. During the present year, from January to June, 128 ships, of which fifteen were steamers, have been lost; and the public will naturally expect to find that the Commissioners have instituted a rigid and searching investigation into the causes of every one of these disasters. We have here official evidence in abundance, evidence from the different surveying Associations, and shipowners' evidence; but as yet no working seaman has been examined. A lieutenant and gunner of the Royal Navy, both stationed in the Tyne, have spoken to the apparently disgracefully overloaded condition of ships in that river; but of course they could only convey general impressions. It is impossible to attempt to make a digest of this evidence offhand; but we will string together a few passages which have struck us as remarkable.

As to the dangerous character of many of the ships which are now in use there is a strong concurrence of testimony. Mr. W. W. Randell, Secretary to the Underwriters' Association, Liverpool, stated that there are certain vessels which, in the opinion of the Liverpool surveyors, are so bad that a particular mark is put against them. "They are a sort of black sheep, and the underwriters will not insure them." As many as 225 vessels have been marked in this way during eleven years—an average of twenty a year. Of these ships thirteen were wrecked, eleven abandoned at sea, eight foundered, six were condemned, and three never heard of. Those that were condemned were either broken up or sold to foreign owners. "It may be that a condemned vessel may be condemned at a foreign port, and sold there, and again sent to sea under a different flag." As to the rest of these black ships, they have not been traced out; but one at least is known to be still in existence after having been on the black list for eight years.

Mr. B. Martell, Chief Surveyor of Lloyds' Register, had no hesitation in saying that a large number of mercantile ships daily go to sea in a very unsatisfactory and defective condition, not only as regards the hull, but likewise as regards the outfit, sails, spars, rigging, and suchlike, which are of great importance as well as the hull. There are above seven hundred ships on Lloyds' Register which originally had a character, and which are twenty, thirty, or forty years of age, but which have now no character; and it is known that a large number of them are in a defective condition, and perhaps there are as many more whose names have been omitted in reprinting the Register Book. Mr. Martell

mentioned a case in which a ship was re-examined, and certain defects found in her which the owners would not put right; her character was therefore expunged. She went to the Baltic, and foundered. When the character of a vessel is taken away, the owner probably tries to sell her, and she goes on sailing until she is either wrecked, or, if she is off the shore in a storm, and making water, the captain runs her on shore to try to save the lives on board, or she eventually founders, and nothing more is heard of her. "During one storm there were, I remember, seventy vessels on shore on the North-East coast at one time, and doubtless many of them were run on shore as being the only means of saving life." Here is a Report which Mr. Martell had sent in a few days before:—"On examination I found the hold beam-roads working considerably amidsips—that is, loose—and the iron bolts in the throats of knees and riders in an unsatisfactory and leaky state. Four bolts, or parts of bolts, were got out with great difficulty, being in a very wasted state." The owner refused to have these defects repaired, and the ship's character has been expunged. "Now," said Mr. Martell, "it is disgraceful that the ship should be allowed to go to sea in that state." In another case, a vessel was reported to be defective, and the owner refused repairs. The crew, when she was going out, refused to go to sea in her, and were imprisoned. The ship foundered. "These," said Mr. Martell, "are cases illustrative of what comes under our notice as surveyors, and these are not isolated cases. We could find a number of similar cases in our records."

Mr. Stephenson, the Secretary to Lloyds', stated that there were shipowners who could not get insured there on account of their evil reputation. He had known a slip of marine insurance with a guarantee at the top of it that the goods should not be placed in a ship belonging to a particular owner, and this owner possessed numerous vessels. In his opinion, there was not sufficient inquiry into the causes of losses at sea. If every case were gone into thoroughly, there would be some singular disclosures. Mr. Stephenson read the following letter from the mate of a ship to his sweetheart:—

DEAR LIZZIE,—We sail to-night, and I wish she was going without me, for I don't like the look of her; she is so deep in the water; but I won't show the white feather to any one. If she can carry a captain, she can carry a mate too. But it's a great pity that the Board of Trade doesn't appoint some universal lead water-mark, and surveyors to see that ships are not sent to sea to become coffins for their crews. But don't torment yourself about me. I dare say I shall get through it as well as anybody else. Hoping you may continue well,

I remain yours fondly,

TOM.

The ship went to the bottom. That, said the witness, was an instance of a vessel going to sea with competent persons on board who knew she was going to the bottom. He had received many letters of this kind.

One of the witnesses examined before the Commission was Mr. William James Fernie, managing director of the Merchants' Trading Company, Liverpool, who gave a remarkable account of the operations of this Company. "The Company owns ships, and sails them—that," he said, "is the principal business of the Company." It was established in 1866, but before that Mr. Fernie had been engaged in shipping business, and he explained that the Merchants' Trading Company was practically himself and his family. Mr. Fernie has been exceedingly unfortunate in his shipping business, as will be seen from the following list of the vessels he has lost during the last ten years or so:—

- 1863.—*John Linn*, wooden sailing-vessel, abandoned at sea coming home from Bombay. No lives lost.
- 1863.—*General Simpson*, wooden sailing-vessel, lost at the Laccadive Islands, coming home from Bombay. Eight lives lost.
- 1863.—*Damen of Hope*, wooden sailing-vessel, started from Bombay and was never heard of. All hands (28) lost.
- 1864.—*Royal Victoria*, new iron ship, foundered off Scotch coast on her way to Calcutta. Fourteen lives lost.
- 1866.—*Royal Albert*, iron ship, homeward bound from Calcutta, lost off Cornwall. All hands drowned.
- 1866.—*Unica*, wooden ship, run down in the Channel. No lives lost.
- 1868.—*Vicery*, wooden ship, from Liverpool to San Francisco, cargo coals; lost through spontaneous combustion. No lives lost.
- 1868.—*Madarn*, wooden ship, cargo coals; lost through spontaneous combustion.
- 1869.—*Great Northern*, wooden ship, lost off Bombay. Sixteen hands lost.
- 1869.—*Windor Castle* (formerly *Emilie St. Pierre*), wooden ship, lost off coast of France; cargo coals; all hands save one perished (21). Mr. Fernie never saw the survivor. He was told the vessel heeled over.
- 1869.—*Golden Fleete*, steamer, made water and sank off Barry Island. There were two trials, and in both the jury found for the underwriters against Mr. Fernie, on the ground that the vessel was unseaworthy. One life lost.
- 1870.—*Widurn Abbey* (formerly *Bellwood*); run ashore off Pernambuco. No lives lost.
- 1871.—*Dramark* (formerly *Greek Republic*), wooden ship, lost in ballast coming from Rio to St. John. She made water and was abandoned. No lives lost. Cargo of coals insured. Mr. Cohen. Was she not well known to be a very rotten ship?—*Widurn*. With all ships fifteen years old you would not find every timber sound in them. I have every assurance that the vessel was perfectly fitted for the work she undertook. Captain Edgell, one of the Commissioners, read a Report he made on the vessel in 1870, showing that she was then in very bad condition. "She was trussed with transverse bars of iron screwed up amidsips, like an old barn, or church, before she started on this last voyage. That is to say, that the whole of the fastenings at the beam ends and knees were so rotten that there was no junction on the sides of the ship, and the only way of fastening the ship together was to introduce these enormous amounts of iron." Mr. Fernie at first said she was surveyed by an American surveyor, whose name he did not know, but afterwards stated that the only surveyor was Captain Rindolf, one of his

own partners. The *Denmark* was purchased for 3,500*l.*, or about one pound a ton.

1871.—*Royal Arthur*, iron vessel, homeward bound from Victoria; lost near Waterford; no lives lost. Mr. Fernie blamed the captain for mismanagement.

1872.—*Royal Adelaide*, iron vessel, outward bound for Sydney; lost near Portland; seven lives lost. Mr. Fernie blamed the captain for carelessness.

1872.—*Florine*; foundered off Bourbon. All on board drowned.

1872.—*Great Australia*, from Rangoon; got ashore and was lost. No lives lost.

1872.—*Henry Fernie*, sprung leak coming from Rangoon, and sailors refused to come home in her. Vessel sold at St. Helena.

1873.—*Dunkeld*, from Calcutta to Havre; lost on the Sand Heads.

In reply to questions by Mr. Cohen, Mr. Fernie explained that the Company partially insured their iron vessels, but not the wooden ones, and that they insured the freights. They had never tried to insure a wooden vessel. The opinions of a gentleman who has had such wide and varied experience in almost every kind of marine disaster naturally deserve attention. "Looking," said Mr. Denny to the witness, "at the heavy losses you have sustained in the last ten years, and to the very few losses that shipowners like Messrs. Smith and Sons and Rathbones of Liverpool have had compared to you, the public naturally may come to the conclusion that, these ships of Smiths' being all of the highest class at Lloyd's, whereas yours are under the American register, these losses occur from your vessels being of an inferior quality; and they may demand some security in the nature of a certificate." Mr. Fernie, however, sees no good in a certificate. "We have all that a certificate would ensure already in the care we take in having the vessels right." Mr. Fernie is opposed to a compulsory survey, on the ground of the "very great inconvenience" which it would occasion to shipowners. He took "a very decided objection" to anything of the kind. If it were insisted upon, he "would consider whether other countries did not take a more proper view of commerce generally, and would see whether or not they could not benefit themselves in that way." Mr. Fernie is apparently in temperament a person of greater buoyancy than some of his vessels. So far from being discouraged and depressed by the steady succession of misfortunes of which he has been the victim, he seems to bear the fatalities of his business with cheerful fortitude. "There are," he says, "certain contingencies attending going to sea which will ever remain. At the present time the death-rate through the country is 23 per thousand, whereas the death-rate in the men employed by me has been about 12 per thousand." It is impossible to put a stop altogether to losses at sea, and Mr. Fernie is of opinion that the best security is to be found in the fact that "it is the interest of every shipowner, irrespectively altogether of propriety, to run his ships safely." It will be observed, however, that in Mr. Fernie's case this security did not prevent the loss of eighteen, or, counting the *Henry Fernie*, nineteen vessels in ten years. It appears from Mr. Fernie's evidence that most of his ships were of colonial origin, and registered in the American Lloyd's.

SEINE-FISHING.

FEW braver or hardier men are to be found in England than the Cornish fishermen. Their business, at all times hazardous, is doubly so on a coast so dangerous as theirs, where the charm of the scenery is bought at the expense of security. Isolated rocks set up like teeth round the jagged cliffs and standing far out from shore, cropping up at intervals anywhere between Penzance and Scilly; sunken rocks which are more perilous because more treacherous; strong currents which on the calmest day keep the sea where they flow in perpetual turmoil; a singularly tumultuous and changeable sea, where the ground-swell of the Atlantic sweeps on in long waves which break into a surf that would swamp any boat put out, even when there is not a breath of surface-wind stirring; for the most part a very narrow channel to their coves, a mere footpath as one may call it, beset by rocks that would break their boats to splinters if they were thrown against them—all these circumstances make the trade of the Cornish fishermen exceptionally dangerous, but they also make the men themselves exceptionally resolute and daring. They are the true fighters with nature for food, and, like the miners, feel when they set out to their work that they may never come back from it alive. No man can predict what the sea will be an hour or two hence. Its character changes with every fluctuation of the tide; and a calm and halcyon lake may have become fierce and angry and tempest-tossed when the ebb turns and the flow sets in. There are times too when a boat caught by the wind and drifted into a current would be as helpless as a cork in a mill-race; and when a whole fleet of fishing-boats might be blown out to sea, with perhaps half their number capsized. But, as a rule, having learnt caution with their hardihood from the very magnitude of the dangers that surround them, these Cornish men suffer as little by shipwreck as the fishermen of safer bays; and though every cove has its own sad story, and every rock its victim, the worst cases of wreck have been those of larger vessels which have mistaken lights, or steered too close in shore, or been lost in the fogs that are so frequent about the Land's End. Or they may have been caught by the wind and the tide, and driven dead on a lee shore, as so often happens in the bay between Hartland and Padstow Points.

But the more cautious the men are the less money they make; and though life is certainly more than meat, life without meat at all, or with only an insufficient quantity, is rather a miserable affair. The material well-being of the poor fellows who live in these pic-

turesque little coves which are the delight and the despair of artists is not in a very satisfactory condition. By the law of aggregation, unification, whatever we like to call it—the law of the present day by which individuals are absorbed into bodies that work for wages for one master, instead of each man working for himself for his own hand—the independent fishermen are daily becoming fewer. Save at Whitesand Bay, where there is a "poor man's seine" and "a rich man's seine," almost all the seine nets belong now to companies or partnerships of rich men; and in very few have the men themselves any share. Fishermen's seines are not well regarded by the wealthy leaseholders of the cove and foreshore; and the leaseholder has very large legal rights and powers, which it would be idle to blame him for exercising. The cove is his, and the capstan is his, and the right of landing is his; so he can put on the screw when he wants to have things his own way, and can threaten evictions, and the withdrawal of the right to the capstan and to the landing-place, if the men will not go on his seine, but choose either a united one of their own or independent drift or trawl nets. Some, it is said, even object to the men fishing at all, at any rate during the seine season; some have raised the annual rent per boat for cove rights to three or four times its old rate; and some go through a round of early suspicion and irritating supervision during the "bulking" days, and huddle jealously over the small share allowed to the hands in the catch. So that, on the whole, the Cornish fisherman of the smaller coves has not much to boast of beside his courage and good heart, and a sturdy independence and honesty specially noticeable.

We know of no more animated scene than seine-fishing. From the first act to the last there is a quaint old-world flavour about the proceeding inexpressibly charming to people used to the prosaic life of modern cities. The "huers" who stand on the hills watching for the first appearance of the "school," and who make known what they see either by signals or calling through a huge metal trumpet, the sound of which no one who has once heard it can ever forget; the smartness of the men dressing the seine-boats which carry the huge net with all its appurtenances; their quiet but eager watching for the school to come within practicable distance—that is, into sufficiently shoal water, and where the bottom is fairly level (else the fish all escape from under the net); the casting or shooting of the seine enclosing the school, and then the "tucking" or lifting the fish from the sea to the boats—every stage is full of interest; but this last is the prettiest of all. Imagine a moonlight night; low water at midnight; when the tucking begins. The boat cannot come up to the ordinary landing, which is only a roughly-paved causeway dipping by a gradual descent into the sea; so those who would share in the sport are fain to take the fisherman's path along the cliff and drop into the boat off the rocks. These rocks are never very safe. Even the men themselves, trained to them as they are from boyhood, sometimes slip on their slanting, broken, seaweed-covered surfaces, when, if they cannot swim and are not helped, all is over for them in this life; and for strangers they are difficult at the best of times. But on an obscurely lighted night, and after heavy rain, they are doubly risky. The incoming wave lifts the boat a few inches higher and nearer; and you must catch the exact moment and make a spring before she drifts off again with the ebb. The row across the little bay is beautiful. The grey cliffs look solemn and majestic in the pale light of the moon; the shadows are deep and unfathomable; everywhere you see black rocks standing out from the steely sea, and little lines of breakers mark the place of the sunken rocks. In the distance shine the magnificent Lizard Lights, and the red and white revolving light of the terrible Wolf Rock flashes on the horizon; the moon touches the sea with silver, and the waves as they rise and fall seem like molten metal in the heavy sluggish rhythm of their flow. Only round the foot of the cliffs and about the rocks they break into spray that serves as "high lights" against the sombre grey and black of the landscape. You pull across to the opposite point, and then round into another smaller bay where the cliffs rise sheer, and the seine net is cast. You come into a little fleet of fishing-boats set round on the outside of a circle of corks, within which is the master-boat, where all hands are assembled pulling at the net, to draw it closer. It is a stirring sight. Some dozen or more stalwart fellows are hauling on the lines with the sailors' cheery cry and the sailors' exuberant good-will. Every now and then the master's voice cries out "Break! break my sons!" when they shorten hold and go over to the other side of the boat, pulling themselves gradually ashore again, till the same order of "Break! break!" shows that their purchase is too slack. At last the net is hauled up close enough, and then the fun begins.

All the boats engaged form a close circle round the inner line of corks, which is now a little sea of silver where the imprisoned pilchards beat and flutter, producing a sound for which we have no satisfactory onomatopoeic word. In moonlight this little sea is silver; in torchlight it is of fire with varied colours flashing through the redder gloams; and in the dark it is a sea of phosphorescent light, each mesh of the net, each fish, each seaweed illuminated as if traced in flame. Every one is now busy. The men dip in baskets, or maunds, expressly made for this purpose, and ladle out the quivering fish by hundreds into the boats. In a few moments they are standing leg-deep in pilchards. Every one on the spot is pressed into the service, and even a boat manned by nothing more stalwart than one or two half-sick and half-frightened women receives their orders; and "Hold on ladies! all hands hold on to the boat!" serves to keep one of the busiest of the tucking-boats in equilibrium. The men, for all their hearty

work, are like a party of schoolboys at play. Their humour may be rough, but it is never meant to be rude; their goodwill is sincere, for they have a share, however small, in the success of the catch; and the more they tuck, the more they will have for their wives and families to live on through the winter. It is their harvest-time, and they are as jocund as harvesters proverbially are. There is no stint of volunteer labour either. Men who have been working hard all day on their own account go out at midnight to lend a hand to their mates at the seine. Even though the take is for a hard-fisted master who would count fms if he could, and who would refuse his men a head apiece if he thought his orders would be carried out, they are all honestly glad. They remember the time when a rich school was the wealth of the whole cove, and when a string of fresh pilchards would be given freely to any one coming to the cove at the time of bulking, or, as we should call it, storing. Still, whatever of economic value there may be in this exploitation of labour, it has its mournful side in the loss of individual value which it includes. And no one can help feeling this who listens to the talk of the older fishermen sorrowfully comparing the old days of personal independence and generous lordship with the present ones of wages and a wide-awake leaseholdship, conscious of its legal rights and determined to act on them.

When all the fish have been tuck, there is nothing for it but to row home again in the freshening morning air. The tide is rising now, and the moon is waning; the rocks look blacker, the grey moss-grown cliffs more solemn, more mysterious; the white surf breaking about them is higher and sharper than when you set out; and the boom of the sea thundering through cave and channel has a sound in it that makes you feel as if land and your own bod would be preferable to an open boat at the mercy of the Atlantic surges. The tide has so far risen that you can land nearer to the paved causeway than before; but even now you have to wait for the flow of the wave, then make a spring on to the black and slimy rocks, which would be creditable to even trained gymnastic powers. So you go home, under the first streaks of dawn, wet through and scaly, and smelling abominably of fish, dashed with a streak of tar for a compound. The whole place, however, will smell of fish to-morrow, and for many to-morrows. When the tucking-boats are brought in, then the women take their turn, and pack the pilchards in the fish-cellars or salting-houses. Here they are said to be in "bulk," all laid on their sides with their noses pointing outwards; layers of salt alternating with layers of fish. Their great market is Italy, where they serve as favourite Lenten fare. The Italians believe them to be smoked, and hence call them *fumados*. This word the dear thick-headed British sailor has caught up, according to his wont, and translated into "fair maids"; and "fair maids"—pronounced *fumados*—is the popular name of salted pilchards all through Cornwall.

The pilchard fishery begins as early as June or July, but then further out to sea, sometimes twenty miles out. According to the old saying,

When the corn is in the shock
The fish are at the rock;

harvest-time, which means from August to the end of October, being the main season for pilchard-fishing in shoul water close at home. There are some choice bits of picturesque life still left to us in far-away places where the ordinary tourist has not penetrated; but nothing is more picturesque than seine-fishing in one of the wilder Cornish coves, when the tucking goes on at midnight, either by moonlight or torchlight, or only by the phosphorescent illumination of the sea itself. No artist that we can remember at this moment has yet painted it, but it is a subject which would well repay careful and loving handling.

KIDDERMINSTER.

THE name which we have placed at the head of this article will be familiar to most persons as that of a small, but energetic and prosperous, manufacturing town in the north of Worcestershire. By its position it is somewhat isolated, as it lies apart from any of the chief lines of communication across England, and perhaps for the same reason it has occupied no important place in the events of English history. The antiquaries of the last century had not much to say about it beyond what was to be gathered from the Domesday Survey, and only amused themselves now and then by an interchange of learned correspondence between some distant Deanery and the Bodleian Library as to the derivation of its singular name. But the modern scientific archaeologist is apt to go a little deeper into things than was the habit of the antiquary his great-grandfather. The good man who drained his bumper of heavy port to the health of King George saw a little further into the past than the schoolboy learner of English history, and did not exactly fix the date

When Britain first at Heaven's command
Arose from out the azure main

in the year 1066; but even to him the preceding historical period appeared very much as if peopled by a mixed multitude consisting of Romans, Danes, Picts, Scots, Druids, Celts, and the like, from which came somehow forth a race known to him as Anglo-Saxons, concerning whom he knew little, and cared less. Of researches into the buried evidence of prehistoric times, such as are now familiar to his descendants, he knew nothing at all. It is therefore to regret the lost opportunities for preserving records of the life

and civilization of a past age which the earlier advances of scientific knowledge might have avoided; but it is very desirable that no indications of any such opportunities which may now come to light should be neglected for want either of knowledge of the subject or of interest in it on the part of those under whose notice they may fall. For this reason we wish to call attention to some traces of past history at Kidderminster which are said to have been found at different depths below the present level of habitation in the town. Of these the uppermost, at a depth of about seven feet, seems to belong to a civilized settlement of some importance; while the lower, at a considerably greater depth, presents traces of human habitation under different circumstances, and of a much earlier period. The facts have been reported by members of one of the principal building firms in the town. It appears that some five or six years ago excavations were being made at the lower or southern end of the town, near the bank and at the level of the river Stour, for the foundations of a factory chimney, and had reached a depth of fourteen or fifteen feet, when the ground is described as having "domed" and blown up or given way, discovering beneath it a quantity of horns and bones, with vegetable and other refuse. On examination these were found to be in the middle of a quantity of piles, standing from four to five feet out of a bed of gravel, through which they were driven to the sandstone rock below. One of these piles was preserved, the rest having been thrown aside or destroyed. It was about seven feet long, and was apparently an oak sapling with the bark still upon it, roughly sharpened at the lower end, very hard and almost black. The surface into which these piles had been driven was said to be about twenty feet below the existing level. Somewhat lower down the stream a similar discovery was made at nearly the same time, but in this instance without the piles. The horns and bones were mixed with vegetable matter, including berries of the alder, which still fringes the banks of the Stour, and rooted stumps of trees which had been growing at the same depth. As it was necessary to complete the building works then in progress, the sites of these discoveries were filled up after examination; but it was mentioned in conversation at the time that the remains of an ancient pavement had not long before been found in the bed of the river at some feet below its present bottom. Such a pavement has within the past month been reached in the progress of some works in Mill Street, which is one of the principal and oldest thoroughfares of the town. A system of sewerage now in course of construction has required cuttings of considerable depth, and in making a connexion with the Mill Street sewer the building firm to which reference has already been made state that "we came upon an old stone pavement about seven feet deep. We also found the old masonry of such a solid description that we had to tunnel under it for the new drains." They add that they "have found much that was interesting in excavating for the new works." The houses beneath which this pavement has been found are two-storied brick buildings, belonging apparently to the early part of the last century, and have been in the continuous occupation of the same family, either as dwelling-houses or offices, from at least that date. The existing ground-floor rooms are scarcely, if at all, above the level of the occasional high floods of the river Stour, so that a street or house level at the depth described would seem of necessity to involve a corresponding depression of the bed of the stream. No record is known to exist which makes any reference to such an alteration of surface, or throws any light on the history of the discovered pavement. But in order to ascertain the nature of the ground through which the Stour passes as it enters the town, an examination was made three or four years ago in the meadows lying at the back of Mill Street, where the soil was found to consist in great proportion of woody and other vegetable matter mixed with clay, to a depth of nine or ten feet, leading to the inference that the whole mass had been deposit washed down by the river.

The existing town of Kidderminster is entirely the creation of its trade. In the early years of the sixteenth century the ancient borough would appear to have so far decayed as to have been little more than a small country village. The population at that date is estimated by Nash, the county historian of Worcestershire, whose volumes were published in the year 1781, and whose estimate is based on the Register of Burials, at 1150 for the whole parish, including the Borough and Foreign of Kidderminster, with all its hamlets, except that of Lower Milton (now better known as Stourport) on the bank of the Severn. The annual burial rate is taken by Nash as one in forty-five, or about twenty-two per thousand; and allowing for the agricultural inhabitants of the hamlets in the Foreign, he thinks that the Borough can have contained a population of little more than three hundred. But it had been a more considerable place in earlier days. At the time of the Norman Conquest Kidderminster was the King's property, and it remained with the Crown till the reign of Henry II., who granted it to one Manser de Bisset, a courtier holding the office of "Despiter" to the King. This Manser founded the Priory or Lazar-house of Maiden Bradley, in Wiltshire, which subsequently became possessed of a portion of his lands in Kidderminster, and in the year 1335 obtained the rectory and advowson. At the dissolution of the religious houses the advowson passed, in 1546, to a "yeoman" of the parish, "ex concessione," as usual, "ante dissolutionem facta"; and the right of presentation was exercised in 1550. It has been conjectured that many of the brothers of the house at Maiden Bradley may have taken refuge at Kidderminster, as the names of several persons bearing the then customary prefix of "Sir" appear in the burial registers of succeeding years. A charter was

granted to the town by Henry II., followed by other charters from Richard II. and Henry VI., and in 23 Edward I. (1295) Walter Oardigan and Walter Lightfrod represented the borough in Parliament. A woollen manufacture appears to have been carried on in the town for a considerable period previously to 1533, in which year a statute was passed for the protection and encouragement of the trade in certain towns in Worcestershire, of which Kidderminster was one. But, without accepting Nash's estimate of three hundred for the population of the borough at the time, which probably allows too large a proportion for the outlying hamlets, it may be taken for granted that, by the middle of the sixteenth century, the town had decayed to a great extent, and had sunk considerably in importance since "a mandate of Henry III." quoted by "Walpole in his History of Painting" (Nash) was "dated from Kidderminster, June 3, 1233." The history of the town previously to the Domesday Survey is, so far as we are aware, entirely lost. The buried pavement in Mill Street, and the still more singular discovery of pile foundations with animal remains among them at a much greater depth, alone point to the site as one of civilized habitation in historical, and of settlement in prehistoric times. The evidence which is thus afforded suggests the question whether the physical geography of the site and its neighbourhood throws any light on the probability of its having been a place of ancient habitation. This probability will be found quite worth being taken into account. The valley of the Avon, crossing Worcestershire from east to west, divides the high ground to the south which forms the watershed of the Thames and Severn from the hills and tableland to the north-east of the county, where the watershed is that of the Severn and Trent. From the Avon northward the only affluent of the Severn on its eastern bank which is of any importance is the small river Stour, the Salwarpe, which brings the water from the Bromsgrove hills and Droitwich, being little more than a brook. Above the Stour the eastern bank of the Severn is shut in from Bewdley upwards by a line of high ground as far as the Wrekin and Wroxeter. The Stour Valley thus gives the only opening from the Severn into Staffordshire, and it has been followed accordingly as the line of the Staffordshire and Worcestershire Canal, by means of which, before the time of railways, the traffic between Bristol and the North-West was carried on.

The course of the Stour from the Severn upwards is by a narrow and somewhat winding meadow valley shut in on both sides by sandstone hills. The general direction of the stream is from north to south; but at Kidderminster there is a sharp bend to the eastward, and the sandstone heights are drawn very near to each other, shutting in the valley by steep rocks where the river passes through the town. The present town lies along the course of the stream and on the slope of its eastern bank; and the position of the church on a high rock overhanging the Stour is popularly supposed to have originated the name of Kidderminster, or Mill-water Church. If our description has conveyed any clear idea of the site, it will be seen that the bend or elbow of the Stour Valley, upon which the town is situated, has formed a natural key to the pass from the Severn; and the earliest traces of habitation which the pile-buildings have indicated are in the narrowest part of this opening, to the southward.

An examination of the lines of communication formerly, as still, existing from the country on the west of the Severn will show Kidderminster to be the point upon which they converge. Between Bridgnorth and Worcester there are now three bridges across the Severn, the lowest of which, at Holt, is of comparatively recent date, is little used, and represents no ancient road. The two other bridges, at Stourport and Bewdley, cross the Severn into the parish of Kidderminster at the two points where the hamlets of Mitton and Wribbenhall lie on its eastern bank. Stourport Bridge was built just a century ago, a little way above the point where the ancient road from Herefordshire and South Wales came down to the Severn, nearly opposite to the mouth of the Stour, and crossed the river at a place called Redstone Ferry, where there still remain cut out in the rock on the west bank the chambers and chapel of a small religious community probably connected with the alien Priory of Astley, who subsisted by the alms of the faithful "as they passed by in their barges," according to an aged informant of Mr. Habington "long since dead" when he wrote, or as they crossed the river, which is perhaps more likely. A farm near this ferry bears the name of Larford, probably the "lower ford," and indicates that the river was fordable where the road crossed it to Mitton (Metune in Domesday), passing thence to Kidderminster by the valley of the Stour. The upper ford, at Bewdley, is still preserved by name in Ribbesford, the parish west of the Severn, of which Bewdley is a chapelry. Two farms, each called "Ribbesford" in Domesday, assign the name to the eastern bank also, where the Kidderminster hamlet is now known as Wribbenhall, and where across Bewdley Bridge the main road from South Shropshire still passes to Kidderminster. As Leland makes no mention of this bridge, it is supposed not to have existed in his time. It is worth notice that at Ribbesford also there remain excavations in the rock, consisting of a chapel and chambers, still known as the Hermitage. These are in Blackstone Rock, on the eastern bank of the Severn, and in the parish of Kidderminster. The only two roads across the Severn between Bridgnorth and Worcester are thus shown to have met at Kidderminster, where they were joined by the main road running from Worcester northward on the eastern side of the Severn, and whence two roads struck to the north-west and north-east, leading respectively over the high lands to Bridgnorth and Shrewsbury, and by the Stour Valley into Staffordshire and the

North Midland district. A strong probability seems thus to be established that one of the minor centres of communication in civilized times would be found in Kidderminster, and the buried pavement which has recently been discovered may perhaps be the first of a series of proofs that underneath the busy power-looms of to-day there lie the remains of an ancient town whose existence has been hitherto unknown and unsuspected. The inhabitants of Kidderminster have never been wanting in skilful and persevering enterprise; and we do not doubt that if a case should be made out for investigation, they will apply in the pursuit of historical science the same interest which they have shown in the improvement of decorative art.

SCOTCH PREACHERS.

IT is known that the people of Scotland are keenly theological, and very particular as to the quality of the sermons which are preached for their edification. The sermon occupies the chief place in the services, and is regarded as their most attractive and important feature. Indeed, the prayers also are often sermons in disguise. Although formally addressed to the Deity, they are intended for the instruction and entertainment of the congregation; and a well-known Scotch clergyman is said to have added to a quotation from Scripture "For that, O Lord, is the correct translation of the passage." Prayers and sermons equally receive the judicial attention of the audience, both from a literary and doctrinal point of view. The democratic spirit and constitution of the Presbyterian Church probably encourage this sort of popular supervision. It appears to be assumed that anybody who hears a sermon is perfectly capable of sitting in judgment either on its orthodoxy or its literary style; and respect for the Church as an institution is thought to be quite compatible with the utmost freedom of personal criticism in regard to individual ministers. Every preacher is closely watched by his congregation and his Presbytery, and an elaborate machinery of a first court and double appeal is provided, in order to test any charges which may be brought against him. Two ecclesiastical suits which have been going on for some time in Scotland, and have just been decided, illustrate in a striking way some of the peculiarities of this ecclesiastical discipline.

The first of these cases was an objection to the settlement of the Rev. W. Mackersy as minister of a parish called Chapel of Garrioch, in the north of Scotland. The grounds of the objection were that Mr. Mackersy's preaching and exposition of Scripture were "cold, dry, shallow, and not well calculated to arouse the attention"; and further, that they were "lifeless, almost destitute of the doctrine of the Gospel, and unintelligible to a large extent." Witnesses were called in support of these charges. The parish schoolmaster, Mr. Selbie, led the way. There was, he said, nothing in Mr. Mackersy's manner "to arrest and fix the eye by a fine, earnest, holy demeanour," "nothing, as it were, to build up in the mind a holy frame." What Mr. Selbie wanted, it appeared, was "burning zeal," and "a warmth beaming from the eye, the face, and, above all, from the intonation of the voice." "You know," he remarked, "what a sleepy preacher does to a sleepy congregation"; upon which some one suggested that "Dr. Kidd threw a book at them." The presentee was also said to be undignified in bearing, expression, and carriage—"a good old Saxon word," added the schoolmaster, "for behaviour." The next witness objected to the presentee's hands, which he thought were very much in his way. "At one time they were in his pockets; then he was keeping the line of the sermon with his finger; and, again, he was ficherin' ficherin', the same as if there had been something annoying him." A farmer thought he was a "cauld, dry, sleepe body," but he may have judged by his own difficulty in keeping awake. Another farmer wanted more "forey" preaching, while a third could not endure the presentee's "silver-grey sort of eyelashes." A witness said he did not observe anything objectionable in "presentee's use of body, hands, and eyes," but he did not finish his sermons properly. "He proposed several courses, but never followed them, saying he hadn't time or couldn't dwell on them." It was also objected to the presentee that there was no love looming from his eye, and that, in preaching, he did not show "any sympathy in the concern." The presentee preached a sermon about Naaman the Syrian, but a farmer said he saw little meaning in it; "it was just a about wash and be clean." In support of the charge of unintelligibility, it was urged that the presentee used such puzzling expressions as "a series of unhappy coincidences" and "a concourse of circumstances." If it is true, as alleged, that such expressions are utterly unintelligible to the ordinary hearer in that region, there must surely be something the matter with the parish school, and the presentee might have retorted upon Mr. Selbie, that it was the schoolmaster's fault if the people could not understand him when he spoke English. One of the most frequent objections to the presentee was that he was not "lively," and it was asked whether he was expected to jump about in the pulpit.

Witnesses were also called on the other side. One thought the presentee's voice very pleasant, and added candidly, "If he didn't offend me, it was my fault, not his." Several said they carried home what the preacher said, though in some cases it turned out upon inquiry that whatever had been carried home had since been lost. A railway labourer said he thought all ministers were very much alike in their preaching, and that the presentee was just like the rest. It was suggested that, if the presentee was not so spirited as he might have been in preaching his first

person, it was no wonder, seeing "he had a lot of hungry dogs looking down on him, to tak' a bite of him gin they could." Another witness, who took a comprehensive view of the subject, remarked that he was pleased with his preaching, but "there's a battle o' ither things in the parish besides preaching." A great deal of attention was given in the course of this inquiry to the presentee's eye. Some liked it and some did not; others didn't seem to care about it one way or the other. One of the problems for the Presbytery was whether anybody had caught it. A member of the congregation said he had caught the preacher's eye, but he could not say whether the preacher's eye had caught his. Much "intercourse of the eye" appears to be demanded at Chapel of Garioch. Everybody knows the sort of intimate, confidential glance which a clever actress sometimes casts at the audience, giving a vast number of admirers in all parts of the house an impression that the look is expressly intended for each of them in particular. Something of this kind would seem to be wanted at Chapel of Garioch. Each member of the congregation is anxious to suppose that the minister's eye rests on him in an especial manner; and the next presentee would perhaps do well to take a few lessons from Madlle. Lucca or Miss Nellie Farren. It came out in the evidence that there was reason to suppose that the presentee was objected to, not so much on account of his personal qualities as on other grounds. An Elder had been heard to say that "Mrs. Sprott" (the retiring incumbent's wife) "was owre proof for a minister's wife, but a proodier was coming." And political opposition to Sir J. Elphinstone, the patron, was also hinted at as a motive for rejecting his nominee. Some of the parishioners were offended because they had not been consulted, and thought they ought to assert their independence. The decision of the Presbytery was against the presentee. The mover of the resolution condemning him admitted that his discourses were "rich in religious truth," but then "the different topics treated of were not separated in that marked and unmistakable manner which some hearers need who are unaccustomed to effort in thinking." The seconder observed that no doubt the presentee's manner was refined and cultivated, and his style polished: but, from what he knew of the parish, this was not the manner or the style to suit this particular parish. It would appear, therefore, that the chief grounds upon which the presentee in this case was declared to be unfit for his place were that he did not divide his sermons into heads, and that his style was polished and his manner cultivated and refined. The Presbytery do not seem to have come to a formal decision about his eye. For some time past it has been becoming tolerably clear that Lord Aberdeen's compromise in regard to the law of patronage was practically a surrender of the patron's position. In the present instance it may be conjectured that the Presbytery pronounced against the presentee simply because they saw that a busy and energetic section of the congregation had made up their minds not to accept "Sir James's man."

The other case to which we referred is one of greater moment. A year or two since Dr. Wallace of Edinburgh wrote an essay on "Church Tendercies in Scotland," in which he said that "the equanimity with which attacks on the standards and contradictions of its doctrines are listened to by the Church, and the leniency with which cases of what is undoubted heresy in the eye of the law are dealt with by all the churches," showed that the hold of the orthodox propositions of the Westminster Confession of Faith on the mind of the people had been weakened. He also suggested that a new and living theology might be built up in the mind of the nation by the free action of the Christian intellect on its appropriate objects, and that unless this was attempted—in other words, unless the restrictions of the old standards were got rid of—there would soon be nothing left but an artificial and lifeless orthodoxy fit only for stolid peasants and superstitious women. It must be confessed that this reads very much like a challenge to the Church, especially when taken in conjunction with the sort of sermons which Dr. Wallace was in the habit of preaching. The Presbytery of Edinburgh therefore felt bound to call upon Dr. Wallace for some explanation. The charges against him were that he had used irreverent expressions, as when he ridiculed the idea of praying to a "fidgetty God" who did not know His own mind and was always shifting from one course to another, and that he had also spoken in such a way as to raise doubts as to the reality of the resurrection of Christ. It is difficult to see how the Presbytery could avoid taking notice of language which was certainly strange and unusual, and which, from the orthodox point of view, must be considered extremely dangerous. It would seem, however, that they were by no means anxious to push matters to an extremity, for they have at once accepted Dr. Wallace's assurance that he believes his statements can be reconciled with the law of the Church, and, warning him to be more cautious in future, have dropped the subject. Here again the Presbytery were probably aware that it would be awkward to resist the opinions of the congregation, who appeared to be quite satisfied with Dr. Wallace's preaching, and were no doubt prepared to stand by him.

The acquittal of Dr. Wallace may possibly have an unexpected effect on the ecclesiastical unity of the rival Church. Mr. Knight, a Free Church minister at Dundee, has resolved to quit the Church rather than submit to a prosecution for heresy before the Synod, after having been tried and acquitted by the Presbytery. Mr. Knight's congregation are prepared to keep him company in his secession, and it is said that they will endeavour to attract themselves to the Established Church as being more liberal, or at least more latitudinarian.

MR. COLE C.B. AT HANLEY.

AN address by Mr. Cole C.B. on the origin and work of the Department of Science and Art is necessarily interesting. A lecturer on a subject which he understands better than anybody else is almost certainly successful, and Mr. Cole is the highest authority upon both the past and the future of the South Kensington Museum. It appears that the noble and beneficent design of which the Prince Consort was the author, and Mr. Cole a principal executor, has sustained a temporary check. The weakness of Ministers could not be supported even by the energetic spirit of Mr. Cole. "The Department has hitherto flourished under a management which ensured individual Parliamentary responsibility." Mr. Cole, who knows all about the Department, tells us this, and we must believe him; but otherwise we should have continued under the impression that Mr. Cole managed the Department just as he pleased, and that Parliamentary responsibility was a delusion. Indeed when Mr. Cole says that the Department had had the "sympathetic support" of statesmen of all political parties, it strikes us that perhaps this is Mr. Cole's way of putting the fact that Parliament let him do as he liked. But recently there has been a change. The Marquis of Ripon "succumbed to a malevolent influence" before he resigned office; which means, we suppose, that he was brought to the conclusion that matters at South Kensington could no longer go on as they had done. However, he has been succeeded by Lord Aberdare, who "took an intelligent interest" in the South Kensington Museum when he was Vice-President of the Council. We like Mr. Cole's way of speaking of a Cabinet Minister as if he were a slightly superior navvy whose mind during the intervals of labour was not wholly dominated by beer. Mr. Cole entreats Lord Aberdare to continue to be the friend of the Department, and we fear that it must be weak indeed if Lord Aberdare is its only friend. Mr. Cole appealed to the experience of the manufacturers whom he addressed, and asked them to tell him whether "muddle and bankruptcy" did not follow when there was no individual responsibility. Of course a public department which commands the "sympathetic support" of politicians of all parties is not likely to be bankrupt; but we had thought that a recent inquiry discovered at South Kensington a pretty considerable capacity for muddle, financial and otherwise, co-existent with individual responsibility. However, the burden of Mr. Cole's complaint is that the South Kensington Museum is to be dis severed from the Department of Science and Art, and is thus to be deprived of the benefit of being represented, or supposed to be represented, in the House of Commons by the Vice-President of the Council. The Museum is to be placed under a Commission of great men who will all be too busy to attend to it. We do not ourselves approve of such a system, but we should have thought Mr. Cole about the last person who would have objected to it, seeing that it is the system under which Her Majesty's Commissioners for the Exhibition of 1851 have been made the obedient servants of Mr. Cole. It is indeed wonderful to observe the belief of this country in Commissions. Every high functionary is supposed to be capable of doing the work of several days in one day. As a barrister in large practice said, "Some of the work you do, some does itself, and some is not done at all." We should think that the Archbishop of Canterbury and the Lord Chancellor would be likely to leave the Secretary and Manager of the South Kensington Museum to himself, and if he has only the enterprising genius of Mr. Cole, we shall see what we shall see. There was for many years a Statute Law Commission, which comprised all the judges and other legal dignitaries as commissioners, and a working barrister as secretary. This Commission did quite as much towards consolidating the Statute Law as could have been reasonably expected from its constitution. But it is evident that if that work is to be seriously taken in hand, it will call for the employment of more than one working barrister. There can be no objection to putting big names into a Commission so long as it is understood that they are merely ornamental.

Mr. Cole, however, goes on to indicate that the body which is to take charge of the South Kensington Museum is the Trustees of the British Museum; and there is of course a great difference between an existing body, however theoretically imperfect, and a body which has to be created for the purpose. Probably no member of the House of Commons has so little wisdom as to pick out the fifty busiest men in that and the Upper House and put them into a Commission to decide whether a cup or dish should be lent as a pattern by the South Kensington Museum to the Hanley School of Art. The necessary effect must be that the management would fall into the hands of the permanent officers of the Museum, who, if they have ability, discretion, and perseverance, will do exactly as they please. Mr. Cole states a pretty strong case against the slow-coaches, as he probably considers them, in Great Russell Street. But after all there is only one Cole, and mere men cannot rival the achievement of divinely-inspired genius. It is not, however, the fault of the Lord Chancellor or the Archbishop of Canterbury that there is no railway station adjoining the British Museum. But perhaps a Hanley student of art might remember what Mr. Cole appears to have forgotten, that Euston Square is much nearer to Great Russell Street than to South Kensington. It would of course be idle to contend that the British Museum is fitted up in accordance with modern ideas of comfort, and we fear it cannot be denied that the Museum is occasionally closed for cleaning and repairs. Mr. Cole says that the South Kensington Museum is never closed for these purposes, "and if His Grace the Archbishop really desired to do the work, he would tell him the secret of it." We do not under-

stand that there is any particular mystery in the cleaning of a building which is kept open all day and every day. Even an Archbishop may have heard when he was young a song which teaches

The best of all ways
To lengthen our days

The student at South Kensington can eat when he pleases, and finds on every object exhibited a label informing him what it is and what the nation has paid for it. We entirely approve the Kensingtonian provision for refreshment, but as regards the money spent by the nation on the Museum perhaps the less said the better. It is rather a depressing subject, and we had rather dwell on the facilities for hand-washing and the ventilation. Mr. Cole says that the student "can breathe freely and get no headache." It is rather hard upon the Archbishop and the Chancellor to lie under the imputation that dirt, discomfort, stuffiness, and starvation are the consequences of their management. We have even heard that the old Reading Room at the Museum maintained a special kind of flea of unusual size and ferocity, and the dignitaries in Church and State who form the body of Trustees would doubtless be responsible for the existence of such an animal upon their premises. Indeed, if they assume the government of South Kensington, it will behoove them to take care that there is no immigration of the subjects of their old dominion.

Mr. Cole and his allies always and on all occasions begin and end with the Prince Consort. He asks the Hanley students whether they will permit the work of the Prince Consort, matured and organized with great care and by the labour of years, to be destroyed, and this insult to his memory to be perpetrated. "Would they suffer the means of their own instruction to be taken away or muddled with old-world decaying notions?" Really this is rather hard upon the "fifty persons of the highest distinction who are well worked with other business." Mr. Cole offers to the art students of Hanley his services during the remainder of his life "to preserve from the hands of the ignorant spoiler their privileges and the institution which the Prince Consort founded." "The ignorant spoiler" is doubtless merely a figurative expression for the Archbishop of Canterbury and his fellow-Trustees, who are, we should think, fully sensible that they have already as much upon their hands as they can well manage. Nobody denies that the Prince Consort founded the Department of Science and Art at South Kensington; but it is not altogether certain that he would have approved of all the developments of his original idea. But the memory of the dead helps little in the conduct of the present business of the world. We should think that even an Archbishop, while alive and with the assistance of his chaplain, could manage the dusting and sweeping business and the refreshments better than a dead Prince. Mr. Cole should, we think, have regard to the risk of bringing absurdity on an illustrious name. The services of the Prince Consort to science and art will soon become as tedious as the Irish Church and Land Bills, and the other legislative achievements of the present Government. The idea of International Exhibitions has been done to death; and probably the impression is widely prevalent that art teaching is something different from perpetual fuss and clutter and shopkeepers' puffery, and that the results attained under Mr. Cole's guidance, although valuable, have been costly. To place the new Museum under the management of the Trustees of the old Museum does not strike us as the most hopeful way of going to work, but those who have proposed it must be strongly sensible of the necessity of putting on the drag. "The beneficent spirit of the aims and labours of the Prince Consort" has led us far enough, if indeed it be his spirit that we have followed, and not an emanation from the brain of Mr. Cole. On the whole we are inclined to take a turn with the Archbishop. Let us see whether somebody cannot be found to manage the South Kensington Museum quietly, efficiently, and unobtrusively. It would be at any rate a relief to hear a little less about that institution, and we are not sure that there might not be at once less noise and more work.

CAPTAIN JACK.

THE execution of Captain Jack and the other Modoc Indians for the murder of General Canby and Dr. Thomas has furnished the American newspapers with a delightfully thrilling topic. As might be expected, a Correspondent of the *New York Herald* went to Fort Klamath, Oregon, where the prisoners were lying under sentence of death, and had an interview with Captain Jack. The Modoc chief asserted that his tribe were encouraged to fight with the whites by the Klamath Indians, who supplied his men with powder and lead. This ammunition was supplied to the Klamaths by order of the Indian agent, so that in fact an officer of the United States Government provided the means of fighting with its troops. When the Correspondent arrived no order had been received from Washington to carry out the sentence, and the settlers were very much agitated on the question, as, if the law were not carried out, the Indians would infallibly be lynched if the settlers could get hold of them. However, it must have been a comfort to the minds of those agitated settlers to observe the business-like proceedings of the "post-carpenter" in making a "six-foot drop." It certainly cannot be said that the American Government does not do its best to civilize the Indians when it builds such a handsome gallows for their gratification. "The erection of a gallows to hang six at a time is rather an under-

taking, but Mr. Field has erected a framework that will probably prove equal to the occasion." It is a pity that an exhibition of the gallows of all nations cannot be organized as part of the Educational Department at South Kensington. The machine used in executing Captain Jack and his associates might be exhibited in work, and we do not believe that even a lecture on cooking would be so attractive to the ladies. "The uprights stand about seventeen feet high, surmounted by a cross-beam thirty feet in length. The platform, set on pine spiles, is eight feet below the beam, solid at the back, and with a hinged front, on which the criminals will be placed standing. The cutting of a single rope will upset the three supports of the front of the platform, and give the six murderers a six-foot drop." We should think that Mr. Field, the post-carpenter at Fort Klamath, would be likely to obtain a medal for this ingenious arrangement, of which the working might be shown by lay figures on half-crown days.

The author of *Life among the Modocs* quotes an Indian saying that "it does not take many words to tell the truth." But if we may judge from the conversations reported in the *New York Herald*, the vocabulary of the Modocs is sufficiently copious for a large amount of lying. Captain Jack alleged, and probably with truth, that he was urged on to the murder by two Indians more bloodthirsty than himself, called Sconchin and the Curly-headed Doctor. Jack's sister, whom the writer calls Princess Mary, told him that it was only through the persistent and determined action of these two Indians in haranguing and otherwise writing blood in the minds of the tribe that Jack, in order to retain his ascendancy as chief, was obliged to take the lead in the execution of their designs. Sconchin had been by general agreement foremost in every deed of blood, and had used his influence with the younger men of the tribe to incite them to further atrocities. In November he led the murderers on Lost River; in February he endeavoured to incite the tribe to murder the visitors to his camp in the lava beds (among whom, as we understand, was the Correspondent); and, lastly, he was the instigator and main conspirator in the plot to murder General Canby and the Peace Commissioners. As a native informant put it, "Klamath Indian tell us bad tale; say Boston people kill you all; I no believe him; say he tell lie; Sconchin believe him; he say he speak truth." It must be gratifying to the enlightened citizens of Boston to hear that the Indian mind contemplates their city as a type of Eastern civilization, and the giver of all good gifts, including a magnificent gallows constructed regardless of expense for the benighted West. The Correspondent opened his talk by saying, "I have travelled eleven days from the East from Boston." Sconchin and other Indians who had killed settlers were afraid to make peace; "he talk fight in council; he say I kill Canby." Then Captain Jack was obliged to say, "I am chief; I kill Canby. I want no one to come with me." It is probable that this is a true account. The more guilty led on the others, until all became involved in the same condemnation. "Captain Jack no like to see Sconchin chief of Modocs." Perhaps we might say that Captain Jack's reason for killing General Canby was almost as good as the French Emperor's reason for going to war with Germany. Captain Jack had traded at Yreka for twenty years, and he appreciated the comforts of civilization. "Captain Jack not afraid of Boston people—want peace. Sconchin he kill many; he afraid; no let Captain Jack make peace." It appears that among the other developments of Eastern civilization an "embalmer" had found his way to California, with the prospect of preserving and exhibiting the remains of Captain Jack. But Mr. Sherwood, the embalmer, had been obliged to abandon this promising idea in consequence of an order from General Schofield prohibiting the mutilation of the bodies of the Modocs. The Indians, or what is left of them, must have a queer idea of that city of Boston which sends them so many and various examples of its civilization. There is first the trader, then the missionary, then the soldier, then the newspaper Correspondent, then the hangman, and, lastly, the embalmer. The project of embalming was not actually carried out, but still it might have been. The United States Government performs an act of stern but necessary justice. Captain Jack and his associates are hanged in punishment of treachery, and for the satisfaction of the aggrieved settlers of the Lost River basin, and it is actually contemplated by a citizen of the United States to make money by exhibiting the embalmed body of Captain Jack. We are bound to confess that the exhibitor would have made a fortune in London, particularly if he added a model of the gallows to the identical body of the criminal who was hanged upon it. Indeed Madame Tussaud and her room of horrors would have been temporarily nowhere; for wax models are a poor and tame affair when we have the opportunity of seeing real human flesh. It was expected that the Modocs would burn the bodies of their warriors, and hold various savage ceremonies; and we hope that the Correspondent will remain at Fort Klamath as long as there is anything for him to describe. But still we feel that a mere description, however graphic, of burning bodies and other savage rites, would not produce in our mind a sensation equal to that of seeing the embalmed body of a murderer.

Such an opportunity for big type as the hanging of four out of six condemned Indians does not happen often; and we find more than a side of large print in the *New York Herald*, headed by the word "Retribution," in letters more than half-an-inch high. It is a pity that the much-afflicted reporters of the Tichborne case do not have recourse to the American plan of large type sub-

headings. Dr. Kenealy could not complain that his own illness was conspicuously notified. "Terrific grief of the squaws and papooses." This style, which our newspapers only use upon the placards of the newsvendors, forms in America an important part of the newspaper itself. We have no doubt the readers like it, and, as a literary article, it is not expensive. Another of these sub-headings is "Address to the Captives by the Post-Chaplain," who, like the post-carpenter, appears to have done everything he could to make the sufferers comfortable. Seonchin, who by general agreement was the greatest ruffian of the lot, expressed his belief that the Great Chief of Washington had been misled by false evidence, but that the Great Spirit who looks from above would see Seonchin in chains and know that his heart was good. It must be owned that Seonchin, with the help of two interpreters and the reporter, made an exceedingly good speech, and there was truth as well as dignity in his concluding words:—"I would like," he said, "to see the Big Chief face to face and talk with him; but he is a long distance off, like the top of a high hill, with me at the bottom, and I can't go to him; but he has made his decision, made his law, and I say let me die." Equally atrocious criminals happening to be not quite so far from the top of the hill have managed to reach it by the help of influential friends, and have escaped the extreme penalty of their crimes. The lawyers, however, could do nothing for Seonchin, as he was tried under a military Commission, which would take little heed of legal technicalities even if it had been possible to invent any in so plain a case. Besides listening to the orations of the prisoners and the lamentations of the squaws, the reporter made a little excursion from the fort to see Mr. Field's patent drop tested, and "it worked like a charm, letting down the trap every time without fail." A party of citizens stood around the scaffold and appeared highly interested with the device of Mr. Field's plan to lower the drop. It strikes us that the style of our playbills must have been formed on that of the sensational columns of American journals—"The Exhortations by the Post-Chaplain, the Mechanical Effects by the Post-Carpenter," &c. The reporter, with a just appreciation of his countrymen's taste, calls this hanging a "social gathering," and adds that Oregon is specially sociable in this way. Among other arrivals, Bob Whittle and his wife and daughter had come with the intention of seeing Jack and party hang, and also of paying a visit to Hooker Jim with a six-shooter, which the reporter thinks would be a convenient supplement to the operation of the law. Several Indians not included in the ingenious arrangements of Mr. Field were "wanted" by the Sheriff of Jackson County for murders on Lost River, and on the whole it would appear that the pacification of the country was proceeding satisfactorily. Two of the condemned Indians were reprieved by the President, on the ground that they had only obeyed the order of their chiefs. The reprieve arrived several days beforehand, but was kept secret until the morning of execution, "in order not to excite any jealous feeling among those not so kindly dealt with." This was certainly very considerate towards the men that were to be hanged, but perhaps less so towards the men who were to be spared. These two men would be imprisoned for life at Alcatraz, the prison of San Francisco, where the reporter thinks they are likely to pass "a pretty dull season." It may be hoped that they were duly impressed by the chaplain's discourse, which was addressed to them under the supposition that they were to be hanged next day. The reporter of course took full notes of this address, which is printed in the same type as his description of the fatal drop. The whole thing is treated as what the reporter himself calls it, "the Last Act of the Tragedy." The Indian spectators would probably understand that the President of the Union and the Governor of Oregon were executing justice. The murder of General Canby and Mr. Thomas would be condemned even by their own moral code; the military judges, the chaplain, and the hangman would fit into their scheme of things, but they must have been puzzled to account for the reporter. Probably they would think that if the city of Boston takes so much interest in hanging, it would be easy, and not expensive, to have a performance nearer home.

REVIEWS.

M. LITTRÉ'S DICTIONARY.*

NO language that we have ever studied, or attempted to study, possesses a Dictionary so rich in the history of words as this great work which M. Littré has fortunately lived long enough to complete. To the love of order, system, and clearness which belongs to the French mind, he has joined a degree of patience in research, and scientific thoroughness in comparison, which we have been accustomed to associate with German rather than with French erudition. The courage which could undertake such a task as this might have been considered mere uncalculating rashness if the workman had not lived to complete his colossal performance; but as the edifice stands here before us, absolutely finished even to the smallest detail, to the tiniest leaflet of its all but infinite detail, and nothing is left to the future but the simple duty of preservation, whilst the builder of it is still alive and still intellectually active, we are compelled to

admit that the courage which undertook it was neither rashness nor self-conceit, but a noble consciousness of gigantic power that were fit for gigantic toils.

Let us make an attempt, in the first place, to convey an accurate idea of what the work really is. The printing is so close, and the paper necessarily so thin, that without arithmetic we are sure to suppose a work of this nature to be far less considerable than it is in reality. The entire work contains 4,708 pages, each page consisting of three columns, and each of these columns (as we have ascertained by counting letters and spaces) contains as much matter as three pages of the foolscap octavo edition of Scott's novels. We have, therefore, 14,124 columns, which are equivalent to 21,187 pages of the novels. But the whole series of Scott's novels only occupies forty-eight volumes in the foolscap edition, and, taking them at an average of 390 pages each, which is a liberal estimate, we have a total which does not reach 19,000. So that M. Littré's Dictionary contains twice as much printed matter as the whole of the *Waverley Novels*, with a few thousands of novel-pages into the bargain. It is only after some study and calculation that this prodigious performance begins to appear in its full grandeur. The mind cannot grasp it without effort and reflection. It occupies amongst intellectual things a place like that of a whale amongst the mammalia, or a Wellingtonia amongst plants, and we have to take measurements and make comparisons before we can become thoroughly aware of its importance. Mere bigness is, however, one of the least of its many claims to attention. M. Littré is not the first man who has made a big Dictionary, and we all know that in labours of this kind the author whose name is on the title-page avails himself of the services of others. The wonder is that so vast an undertaking should have been carried through from beginning to end without the slightest hitch or flaw, and in perfect obedience to one great governing idea. The conditions needed for this completeness in execution are in their combination of the utmost rarity. No one could begin such a work without the certainty of subsequent alterations in method, if he were not already in the fullest maturity of his powers, and provided with stores of erudition such as it takes an ordinary lifetime to accumulate. Every literary workman is aware of the changes of tone and style which come over every work that has extended over a series of years, and of the strong temptation to alter the original plan as the mind slowly passes out of the state in which the plan was first conceived. What a nation does with a building that requires several generations to complete, the individual does with a piece of labour that costs him several years. The old cathedrals are often heterogeneous, out of keeping, wanting in strict harmony, because it took too many generations to erect them, and the art of the nation had had time to change its temper and its taste; and so there are big books, such as Mr. Ruskin's *Modern Painters*, which are wanting in unity and proportion because the execution of them has been spread over too large a space in the lifetime of the author, and he was not the same man in the last volume as in the first. To carry out such a plan as M. Littré's with perfect consistency, the enterprise ought not to be begun before the age of fifty, and the health and energy of the author ought to remain unimpaired for at least twenty years longer. It is unnecessary to add that age is not the only needful qualification, that the workman must have been prepared for his task by a lifelong exercise of the faculty of criticism, and by an immense erudition, and that he ought to take a passionate interest in the history of language, especially of the language he designs to illustrate.

M. Littré appears to have been gradually led towards the greatest undertaking of his life by studies in old French. Those led him to pursue the history of words, and to conceive the idea of a Dictionary in which the history of words should have a very important place. It is probable that at the time, now more than twenty years ago, when M. Littré first undertook his Dictionary, there was not another philologist in France so well prepared for such a task. It is scarcely too much to say that his whole previous life had been an education for this one object, since even his scientific studies and early medical training have given greater thoroughness to the scientific vocabularies which are included in the Dictionary, whilst his labours in other languages have given him a command of etymological resources which is not to be paralleled even in works undertaken for etymology alone. Evidently twenty years would be too short a time for a work containing more than twice the matter of all the *Waverley Novels*—and matter, too, requiring most careful reference, classification, and verification—if the author had not been aided by competent coadjutors. M. Littré mentions five of these—MM. Brant, Hurd, Pommier, Peyronnet, and Leblais—especially M. Leblais, a professor of mathematics, who worked long and assiduously at the Dictionary. In the correction of the press, which in itself was a prodigious piece of work; M. Beaujeu, a University professor, helped M. Littré by correcting the first and the last proof of every sheet. Two other friends, MM. Sommer and Jullien, both good servants of the cause of learning, and known by other labours, placed all their knowledge at M. Littré's disposal. M. Humbert, of Geneva, when he heard that the great work was in progress, sent a rich collection of literary notes which proved useful, and a few other voluntary auxiliaries supplied technical explanations or practical suggestions. Two labourers in the same field, long since dead, have also aided M. Littré by the materials they left behind them. Lacurne de Sainte-Palaye, who lived in the last century, had prepared a Dictionary of old French, of which only the first volume was published; the materials that he collected fill thirty folio volumes of manuscript, which are preserved in the National Library; these materials consist of examples

* *Dictionnaire de la langue française*. Par M. Littré, de l'Académie française. Paris: Hachette.

taken from old authors, and M. Littré has constantly had them before him. Pougens also, who lived in the earlier half of our century, had a project for publishing a *Trésor des origines de la langue française*, of which a specimen was published in 1819, and from which also two volumes were extracted, under the title of *Archéologie française*. As a preparation for this work M. Pougens had made extracts from many authors of all ages, and this to such an extent that they fill a hundred folio volumes, now in the library of the Institute. Whilst the Dictionary was passing through the press M. Littré continually referred to this collection, and by its help was enabled to fortify and enrich his articles, and to fill in what he felt to be incomplete.

After giving us these details M. Littré closes his preface (written before the completion of the work, which came out in parts) with the following words, not unworthy to be meditated by all who undertake great labours, whether, like Pougens and Lacurne de Sainte-Pelaye, they are destined to be interrupted by death after having done no more than collect great masses of material for an edifice never to be built, or whether, like the more fortunate author of the *magnan opus* before us, they are of the happy few who live to see mighty conceptions realized:—

Ici se clôt mon compte de débiteur. On le voit, mon entreprise est œuvre particulière et d'un seul esprit, en tant du moins que conception et direction. Telle qu'elle est, elle a été conduite au point où la voilà par un travail assidu, et, pour me servir des expressions du fabuliste, par *patience et longueur de temps*. Il sera besoin encore de plusieurs années pour terminer l'impression et la publication du tout. Quel est le sexagénaire qui peut compter sur plusieurs années de vie, de santé, de travail? *Il ne faut pas se les promettre, mais il faut agir comme si on les promettait, et pousser activement l'entreprise commencée.*

The words we have italicized are a jewel of intellectual wisdom. Who could undertake anything considerable if he suffered himself to be deterred by lugubrious reflections on the uncertain tenure of human life? What general could plan a campaign if he stopped short in his calculations at the thought of possible death in the first battle? If Death comes in his character of Interrupter, that character in which he always appeared to Nathaniel Hawthorne, then the work, like Macaulay's History, must remain a fragment, or else be carried forward by the labours of another; but this is not a reason why the first projector should work less actively whilst health and strength remain to him. In M. Littré's case the completion of the Dictionary was not certain; it was scarcely even probable; but by working heartily as if it were probable, and keeping steadily to his task without permitting himself to be discouraged by the immensity of the material to be handled or by the brevity of an old man's life, he made the work, if not a probability, at least an actual fact. His hopeful courage communicated itself to his auxiliaries, and to the head of that great publishing house which has already such substantial claims on the gratitude of Frenchmen—claims which are largely increased by the present noble publication.

A simple transcript of the title is of itself enough to give a comprehensive idea of the plan; but it is only after carefully reading the whole of the long preface that we really begin to understand the difficulties of the undertaking. According to the title, the Dictionary contains, first, in the way of nomenclature, all the words in the Dictionary of the French Academy, and all the terms commonly used in the sciences, the arts, trades, and practical life. Secondly, as to grammar, the pronunciation of every word is figured and discussed whenever necessary; expressions, idioms, exceptions, and sometimes also the present state of orthography, are examined, and all the irregularities of the language are critically observed upon. Thirdly, for the signification of words, definitions are given, and different meanings arranged in logical order, with numerous examples taken from classical and other writers, synonyms being chiefly considered with reference to the definitions. Fourthly, for the historical portion of the plan we have a collection of phrases belonging to old writers from the beginnings of the French language down to the sixteenth century, in chronological order after the words they illustrate. Lastly, as to etymology, the author either determines or discusses the origin of every word by a comparison of the same forms in French, in the different patois, in Spanish, in Italian, and in Provençal. These are the promises on the cover of the volumes, but the work itself goes considerably beyond them. For example, we observe that all the irregular verbs are conjugated (a great help to foreigners, and to many natives also), and that, although the first comparison of forms may be made between the languages and dialects just enumerated, the author gives the parent word whenever possible in Sanscrit, Greek, Latin, English, &c., as the case may be.

The preface contains thirty-nine pages of large type, and the "complement" to the preface, a most instructive essay on the history of the French language, in much smaller type and in double columns, occupies about twenty-seven pages. We propose first to give an analysis of the preface, and afterwards some examples from the body of the work to show how the idea has been carried out.

M. Littré begins by telling us that, as such an enterprise is always a very long and heavy undertaking, he would not have left for it the ordinary studies of his life, knowing that it must cost him twenty years of labour, had he not been seduced by the charms of his "plan." Like all men who have indulged in plans, and had the courage to carry them into execution, M. Littré has experienced the great difference which exists between the first intoxication of contemplating or perfecting the "plan" and the subsequent toil and drudgery which have to be gone through before it can become a reality. He tells us that

when a plan first appears to the mind it seduces and captivates, being all light, order, and novelty; but afterwards, when the hour is come for practical execution, when it is necessary to arrange in the framework of the plan the formless mass of material that has been heaped together, then is the decisive trial. "Rien de plus laborieux," he says, "que le passage d'une conception abstraite à une œuvre effective." Still the delightfulness of the plan, and that alone, sustained M. Littré's resolution. He worked on because the plan had changed the ordinary point of view, and raised the level of lexicography.

The first conception of the Dictionary was suggested by the author's studies in the old French language, or *langue d'oïl*. He was struck by the connexion between old and modern French, and by the quantity of instances in which modern expressions and meanings could only be explained by the meanings and expressions of the past, as well as by so many examples in which the modern form of words is unintelligible until we know the forms which preceded them; so that the history of the language seemed to him the only substantial basis for the understanding of it. Then came the parent idea of the Dictionary, the *idée-mère*, as the lexicographer himself calls it—the idea of a Dictionary which should include and combine the present use of the language with its past use, in order to give to the present use all the fullness and sureness possible. Just as in politics it is impossible to understand the feelings of actual parties without knowing the history of the ideas which have preceded modern ideas, so in philosophy we cannot understand the words that are used to-day without knowing the forms and meanings which belonged to those words or their substitutes in the generations that preceded ours. The difference between this conception and the ordinary notion that governs the compilation of etymological dictionaries is the difference between a scientific investigation of successive changes and mere guessing in complete ignorance of them. The difference in cost of labour between the two methods is great indeed, but there can be no doubt which of the two is the more satisfactory to any serious student.

M. Littré is much too intelligent a man to be seduced by the common French superstition that a language can be fixed for ever. He sees that language is always in motion, always slowly submitting to the inevitable law of modification, and he does not believe that either classic authors or scientific dictionary-makers can resist the endless change:—

Sans parler des altérations et des corruptions qui proviennent de la négligence des hommes, et de la méconnaissance des vraies formes ou des vraies significations, il est impossible, on doit en convenir, qu'une langue parvenue à un point quelconque y demeure et s'y fixe. En effet, l'état social change; des institutions s'en vont, d'autres viennent, les sciences font des découvertes; les peuples, se mêlant leurs idiomes; de là l'inévitable création d'une foule de termes. D'autre part, tandis que le fond même se modifie, arrivant à la désuétude de certains mots par la désuétude de certaines choses, et gagnant de nouveaux mots pour satisfaire à des choses nouvelles, le sens authentique, qui ne fait défaut à aucune génération d'âge en âge, sollicite de son côté l'esprit à des combinaisons qui n'ont pas encore été essayées. Les belles expressions, les tournures élégantes, les locutions marquées à fleur de coin, tout cela qui fut trouvé par nos devanciers s'use promptement, ou du moins ne peut pas être répété sans s'user rapidement et fatiguer celui qui redit et celui qui entend. *L'aurore aux doigts de rose* fut une image gracieuse que le riant esprit de la poésie primitive rencontra et que la Grèce accueillit; mais hors de ces chants antiques, ce n'est plus qu'une banalité. Il faut donc, par une juste nécessité, que les poètes et les prosateurs innoverent.

To counteract the tendency to innovation we have the spirit of archaism, from which M. Littré hopes more than we should have been inclined to hope. It is true that, as he argues, the mass of what is now used as current language has been transmitted to us from the past, and much of it from a remote past; but although the French have a great respect for the traditions of what they call their classic time, which are authoritative, though not authoritative enough to preserve all the forms of that epoch, they are quite remarkable amongst modern nations for the facility with which they have allowed their language to become impoverished by the disuse of words and forms which modern taste has rejected, or lost from mere carelessness, without providing efficient substitutes. If we compare French with English, we cannot fail to be struck with the greater prevalence of archaism in our own language, whilst at the same time we give greater liberty to innovators who add to the stock already existing. The fact is that the French yield much too easily to the forbidding power of present custom in these things. A French writer dares not introduce a new word or revive an old one, when an English writer would do either without hesitation, and it may be especially observed of French poets that they venture much less boldly in the direction of archaism than English poets do. Almost all the celebrated English poets of this century have indulged very freely in archaism, and the tendency to it is as strong now in the days of Morris and Rossetti as it was in *Childe Harold* and the *Lay of the Last Minstrel*. We heartily agree with M. Littré in the value he attaches to archaism; for without it there would be little chance of preserving, and none whatever of reviving after temporary disuse, what is best and most precious in the language of other ages; indeed without it the noble tongue of the English poets could never have been used in the poetry of to-day. M. Littré himself may have rendered a great service in this direction, and his Dictionary may do much to preserve the memory of old French, and even something perhaps, though this is more doubtful, towards a judicious revival of words and phrases which ought never to have been abandoned. He regrets their loss, and believes that a right spirit of archaism would have prevented it. No one is likely to have a better influence in bringing about the prevalence of such a spirit than the

lexicographer who translated the First Book of the *Iliad* into the French of the *trouvères*.

It is not to be inferred, however, from this strong historical tendency that M. Littré has included the old French tongue in the work before us otherwise than as it was found to be necessary or useful as an illustration of the French of to-day. He has not included obsolete words in the alphabet of his Dictionary. Dead French would be the object, he considers, of labours different from his own, and he recommends it to the attention of the learned. Every student of old French would feel grateful for such a dictionary of the obsolete language as M. Littré would be able to construct if time and strength were spared to him, and it is to be regretted that French erudition has not yet created such a work. The Dictionary before us is indirectly a help to the study of old French, and a rich glossary of old French might be culled from it; yet its object is not to cast light upon the past, but on the present. It is "a register of the uses of the language, a register which along with the present includes the past wherever the past throws light upon the present as to words, their meanings, or their employment." The author is too modest to imagine that the register can be complete, for, to make it so, it "would be necessary to have read everything pen in hand, and he has not read everything; it would be necessary also not to be the first in such a labour, and M. Littré is the first who has brought together the materials and tried to make them serve in a systematic way for the study of the language."

We have not had space in this paper for much more than a general outline of M. Littré's intentions, and we intend at a future time to show how he has put his design into execution.

AT NIGHTFALL AND MIDNIGHT.*

MR. JACOX, author of *Cues from All Quarters* and other works, continues to empty his commonplace-book for the amusement of the public. The string upon which his pearls are arranged in the present instance gives a little more unity to his work than usual. If the literary merits of the book were equal to his design, Mr. Jacox might have put together a really pleasing collection of essays upon the thoughts naturally suggested to us by darkness. As it is, there are some chapters which are interesting to the critic as bringing together the numerous variations which authors have played upon some familiar theme. The comparison of parallel passages by the leaders of literature is in many ways instructive. It is interesting, for example, to see how writers differing so widely from each other as Hawthorne, Dickens, Scott, Leigh Hunt, Longfellow, Béranger, Victor Hugo, and Mr. Trollope have treated the same text of "fire-gazing"; and some practical moral might perhaps be deduced from the long list of writers who have indulged in the fascinating, but, as it is generally thought, deleterious practice of converting night into their time of study. Mr. Jacox, however, is content to give us the raw materials, and to allow us to draw our moral for ourselves. Perhaps we have no right to complain of the limitation of his ambition, though we confess that we have a certain prejudice against books composed exclusively by the help of paste and scissors. We have another complaint of a rather more serious character against Mr. Jacox. His literary studies have been tolerably extensive, but we cannot share his apparent predilection for second-rate authors of the present century. He has been a diligent student of Wordsworth and Byron, of Scott, Dickens, and Thackeray; and so far his labours have been well spent. But we could willingly have spared his elaborate quotations from inferior novelists and poets, obsolete before they are old, in consideration of more frequent excursions into literature of the highest class. He is a rather indiscriminate reader, in short, and appears, if we may judge from the quality of his extracts, to enjoy *Lady Audley's Secret* as heartily as *Old Mortality*. However we will not be severe upon a gentleman who is at any rate not arrogant or offensive. We will take what Mr. Jacox has given us with such gratitude as we may, simply venturing to remark that perhaps it would have been as well had he entrusted the materials so carefully collected to some one better able than himself to turn them to account. A critic should, as a rule, content himself with distributing praise or blame, and not venture upon the more difficult task of showing how the faults which he indicates might have been amended. For once, however, we will commit a rash action. We will write a chapter from the materials provided by Mr. Jacox. Of course, whilst thus changing places with the author, we do not pretend to say that our own performance would pass muster with a severe critic. We shall merely make a rough attempt to show what might have been done with Mr. Jacox's facts; but we only aim at indicating a possibility, not at effectually supplying his place. If we had been at the pains of collecting the illustrations as well as of combining them, thoughts would probably have occurred to us which might have made our essay more valuable.

The chapter which we select is one entitled "Last Words." Mr. Jacox considers himself entitled to take night in its metaphorical as well as in its direct significance. The first remark which occurs to one about recorded last words is the obvious one that most likely they were never really spoken. Mr. Jacox, indeed, rather naïvely remarks that we can generally trust in the authenticity of last words pronounced by men who were executed in public. Certainly there are, in such cases, plenty of witnesses; but, on the other

hand, they are in a great state of excitement. Some of them regard the sufferer as a martyr to a good cause, and others regard him as a criminal undeserving of sympathy; and, in fact, an atmosphere of legendary exaggeration grows up in such cases quite as easily as round the death-bed of a great man, whose last moments may be passed in a tranquillity which leaves room for quiet observation. The real peculiarity of the last words attributed to the victims of public justice is that the sufferer is generally more or less acting; we do not mean that he is acting in the sense of being insincere, but that he feels himself to be playing a part in a most exciting drama. The dying speech will, consequently, be less spontaneous and more consciously intended for public consumption. The most interesting last words, therefore, are those which we can believe to express the most intimate sentiment of a man passing consciously into eternity. Considered as a species of literary composition, they should be a kind of anticipatory epitaph; they should be sufficiently characteristic to express the idiosyncrasy of the speaker, and at the same time should express some pathetic sentiment common to all mankind; for, at the last solemn moment, the petty interests of the individual should disappear. Pope speaks of dying words as exhibiting the "ruling passion strong in death"; and the phrase which he gives to Cobham, "Oh, save my country, heaven!" is an excellent example of what a dying speech ought to be. The authenticity of the very similar words attributed to Pitt has been disputed; though it seems that he really said something of the kind. The only criticism which occurs to one is whether even patriotism is not too narrow a passion to occupy the mind in the presence of death. Death should elevate us above ties to any special country. We incline to prefer, therefore, the dying words of Nelson:—"Thank God, I have done my duty." They are thoroughly characteristic; and though the duty which Nelson had accomplished, involving the destruction of a large number of his fellow-creatures, was perhaps scarcely quite fit for a dying congratulation, yet the general sense of accomplished duty is undoubtedly amongst the noblest of consolations.

Let us expose to a similar test a few of the earlier dying words mentioned by Mr. Jacox. Martin of Tours said to the devil as he was dying, "Thou hast no part in me; I go to Abraham's bosom." Here there is not much that is specially characteristic, and the sentiment may perhaps be considered as savouring too much of what has been called other-worldliness. Joy at escaping the devil is after all rather a selfish sentiment. Bede expired whilst repeating the Doxology. Such an end is edifying; but there is a want of special applicability. To turn to Pagan philosophers, Marcus Aurelius said to the centurion of the watch, "Turn to the rising sun, for I am setting." Here we may feel that the touch of sarcasm which mingles with the melancholy is a little out of place. A nobler sentiment is attributed to Antoninus Pius, who gave to the tribune asking for the watchword the last word "*Aquanimitas*." If authentic, this is one of the noblest of dying words; being at once highly characteristic and conveying the best teaching of philosophical morality. The chief objection that can be made to it is that it savours a little of a lesson learnt by rote. This fault is a very fatal one, for we naturally lose nearly all interest in a dying speech when we feel that it is merely an attempt to catch at an accustomed formula, and therefore betrays less the genuine feeling of the man than an instinctive disposition to do what is expected of him. The last words attributed to Michel Angelo, "In your passage through life, remember the sufferings of Jesus Christ," are really impressive; because we can believe that such a thought occurred to a religious mind with unusual force at the last solemn moment. But we are not much interested by Cranmer's repetition of the dying words of St. Stephen; for words, however impressive in the mouth of the first man who used them, lose their force by the very fact of being a repetition. What Cranmer really meant to say was simply, I am a martyr on the pattern of the first; and the sentiment, though certainly not unbecoming, was not sufficiently individual to be impressive. The wish about his hand is far more pathetic; though our judgment of its value will be necessarily biased by the view which we may take of his previous life. Another dying phrase is characteristic in the mouth of the speaker, but has not sufficient interest in itself to make it pathetic. "I die like a good Catholic," said Philip II., "in faith and obedience to the Holy Roman Church." Hooker's last words are to us a more impressive embodiment of a similar thought:—"I could wish to live to do the Church more service, but cannot hope it; for my days are past as a shadow that returns not." Here we feel another slight quail; the sentence is a little too elaborate for a dying man. Last words should be epigrammatic without being flippant. We are perhaps more moved therefore by the utterance of De Quadra, dying at a time when his long labours seemed to have a chance of fulfilment:—"No *puedo mas*; I can do no more." There, though the sentiment is exceedingly simple, we feel the pathos of a strong man breaking down, but struggling to the last; and, whatever be the objects to which he devotes himself, there is always something impressive in such a spectacle. With this phrase we may compare the pathetic exclamation of Baxter, "Almost well"—a phrase which is striking by its incompleteness and its consequent breadth of possible significance.

Coming to sufferers of a different class, we have a model of the way in which the dying ought not to speak in the last words of the grandmother of Frederick the Great:—"I am now going to satisfy my curiosity about matters which Leibnitz has never been able to explain to me—about Space, the Infinite, Being, and

* *At Nightfall and Midnight: Mottos after Dark.* By Francis Jacox. London: Rodd & Morgan. 1873.

Nothing; and for the King my consort I prepare a funeral pageant which will afford him a new occasion for the display of his magnificence." One hopes that the poor lady was wandering; but there is something characteristic of the period in this view of the next world, as a region where we should be able to solve problems just too hard for Leibnitz, and where at the same time the pomps and vanities of the Prussian Court would still be worthy objects of consideration. The last words of Frederick himself belong to a different class. They are simply trifling, and become pathetic only by force of contrast. He told his attendants to throw a quilt over one of his dogs who was shivering on a stool. Somewhat resembling this are Chesterfield's often-quoted words, "Give Dayrolles a chair"; they are generally said to be characteristic, though in an unpleasant sense. They are, however, merely characteristic by accident, if we may say so; for any other man might have accidentally used such a phrase at his last moment, and we do not suppose that even in Chesterfield, a man of genuine ability, though a coxcomb and a profligate, the desire to be courteous was really a ruling passion. We put into the words more than they will fairly bear. A similar misgiving, though in a very different case, besets us about Goethe's celebrated "More light." We have here an odd coincidence, not a great man's conscious expression of his strongest emotions. Another celebrated dying speech is offensive because too conscious. Mirabeau's "Si ce n'est pas là Dieu, c'est du moins son cousin-germain," is a melancholy bit of false bombast at a solemn moment. We prefer, on the whole, some dying speeches which, if not very dignified or pathetic, have at least the merit of being genuinely characteristic. James Brindley's phrase, for example, "Puddle and puddle it again and again," in reference to a leaky canal, has a certain racy flavour; and, though morally objectionable, the last words of Thurlow, "I'm damned if I don't think I'm dying," are as good a specimen of the coarse grotesque as can easily be found.

Passing in review these and a good many other instances collected by Mr. Jacob, most of which are tolerably familiar, we are inclined to repeat, How hard it is to die; at least to die gracefully and affectingly. Some touching phrases have been uttered by dying men, and some good ones have been invented for them; but it is seldom that we can quote any such expression with entire satisfaction. We are inclined to doubt whether the best remark upon the subject is not that made by Whitefield a short time before his death. One of his disciples—a charming creature he must have been—was anticipating from him "a special testimony for Christ which should be borne on his deathbed." Whitefield, we may guess, was a little disgusted by this anticipatory gloating over his dying emotions, and replied, "I shall die silent." He died as he had said; and we are glad that there was one less opportunity for an unctuous deathbed tract. When we think of death, and reflect upon the possibility of being surrounded by hungry biographers anxious for a pretty concluding paragraph, we are tempted to wish that every great man would follow Whitefield's example.

GRAZEBROOK'S HERALDRY OF WORCESTERSHIRE.*

WE feel that we should be doing wrong to a herald or genealogist, just as we should be doing wrong to a freemason, if we cut short one word of his title-page, seeing that every word of it doubtless contains for the initiated some meaning beyond what appears at first sight to ordinary eyes. We might perhaps raise a cavil whether *Heraldry* Dictionaries or even "ancient manuscripts," without further description, are necessarily "trustworthy sources." But we are not just now inclined to cavil. Mr. Grazebrook, as further appears from his title-page, is the author of the *Heraldry of Smith*. Now, if a man must write about heraldry at all, how much better it is to write about English Smith, that most ancient of Teutonic names, which loses itself among legends of Woden and Thunder, than to go floundering about among the doubtful generations of such outlandish and modern-sounding people as Percy, Plantagenet, or De Vere. An enthusiastic genealogist once lamented the hard fate of Adam, in that he could not possibly have employed himself with his own favourite study. Now if we might be allowed to put together certain signs and certain interpretations of Genesis, we are not at all clear that Adam might not have studied the genealogy of Smith. The Smiths, we are glad to see, fill a considerable space among what Mr. Grazebrook calls the "armigerous families" of Worcestershire, and we are further glad to see that all the Worcestershire Smiths have the sense to remain Smiths, with the primeval sound and spelling. Not one of them has degraded himself into any such grotesque guise as Smyth, Smythe, or Smith; not even into High-Dutch Schmidt or Mr. Kingsley's hybrid *Smid*. As for "armigerous families," we should have thought that every Smith was in his own nature "armigerous"; at all events it is certain that, without the help of Smith, there could be no "armigerous" families at all. And besides all this it is plain that Mr. Grazebrook's researches among the bearers of the great Teutonic name have done him good now that he has

come down to deal with the names, arms, and pedigrees of smaller people. Genealogy in the hands of Mr. Grazebrook is very different from genealogy in the hands of Sir Bernard Burke. Even when under the spell of the pursuit which doth most gender to falsehood, Mr. Grazebrook never stoops to be what our forefathers called a *Leasbrend* or *Leasagol*, what, if they had not had too much respect for the formula, they might have called a *Leasmið*. We never saw a book of the kind which had so few mythical statements, and those few Mr. Grazebrook always contrives to put into the mouths of other people. The very choicest themes for romance are sternly passed by. Worcestershire contains a Bulstrode; but the Worcestershire Bulstrode did not come to meet William the Conqueror riding on a bull. Worcestershire contains a Grosvenor; but Mr. Grazebrook knows too well what he is about to trace him up to any imaginary nephews or nieces of him whom Bulstrode rode to meet. Worcestershire does not contain a Coulthard; but Mr. Grazebrook does not fail to make a remark in his Preface which shows that, if such a one had been found within his borders, no mercy would have been shown to any pretensions to descent from any one recorded in any of the writings of Tacitus.

Perhaps the ordinary student, to whom heraldry and genealogy as such offer no attractions, but who is perfectly ready to make use of either, as of anything else, whenever they explain or illustrate greater matters, will be most struck by the small amount of such help which they really give. Mr. Grazebrook steadily gets rid of the fables; only, when he has got rid of the fables, there is so very little left. The names and arms and pedigrees of families most of which cannot be traced back more than two or three hundred years, and few of whose members ever did anything of the slightest general importance, do not seem to be in themselves an attractive subject. The facts, like all facts, doubtless have a certain value; but their value would seem to be simply that of a branch of statistics. To know the succession and marriages of the obscure lords of an obscure manor would seem to be knowledge of exactly the same kind as knowing the number of pigs which fattened in their sties, and the kind of crop which grew on every acre of their estates. To the student of statistics all these facts are worth knowing; so is every birth, death, and marriage that is entered in the parish register. What we do not understand is in what way the births, deaths, and marriages of the "armigerous families," so long as they are simply "armigerous" and not in any other way remarkable, call forth any special interest beyond the births, deaths, and marriages of the families which are not "armigerous." As for "old" families, in strictness one family is as old as another; and the forefathers of the labourer have, as a rule, lived longer on the land where they now live than the forefathers of the squire or the duke.

We do not know whether it is wholly owing to Mr. Grazebrook's care in getting rid of fabulous matter, or whether the armigerous families of Worcestershire have really had the good sense to keep themselves more clear of absurd fictions than their fellows in some other counties; but certainly there is an unusual absence of absurdity in these Worcestershire pedigrees. We find very few cases indeed where Howard or Tomkins came over with the Conqueror, or of those more mysterious cases where Sir John Ashburnham, with his full turn-out of surname and French title, is in full possession before the Conqueror comes. Mr. Grazebrook sets aside the claim of the house of Cokes—which, as one of its members founded Worcester College, is something more than merely armigerous—to have "come over with the Conqueror." It is so stated by Sir Bernard Burke, to whom proofs do not much matter; but to Mr. Grazebrook it is "not proven." That is just the state of the case. When King William came into England, he brought his cooks with him, as any settler, whether Conqueror or otherwise, from those parts would most likely do now. The holdings of these cooks are entered in several places of Domesday, but there does not happen to be a single cook settled in Worcestershire. But there are some hard by in Gloucestershire, so that the migration of a Gloucestershire cook, and the descent of Cokes of Bentloy from King William's *chef*, is, unlike most genealogical boasts, neither impossible nor unlikely. Still, as Mr. Grazebrook says, it is "not proven." But we may use stronger language when, "says Mr. Shirley"—not "says Mr. Grazebrook"—the family of Lechmere is "said to have migrated from the Low Countries, and to have received a grant of land, called 'Lechmere's Field,' in Hanley, from William the Conqueror." Mr. Shirley—not of course the late Professor of Ecclesiastical History—or anybody else may of course say what they please, but there is no "Lechmere's Field" in Domesday; and though Lechmere or any other family may be descended from certain "servi" and "porcarii" or even from "unus francigena," all of whom are recorded at one or other Hanley, none of these people are at all likely to have migrated from the Low Countries. Mr. Grazebrook however does trace back Lechmere by that name to the seventeenth century, when they already had a "descent." Marry, this is somewhat; for the metamorphosis of Russell into Pakington belongs to contemporary history, and we find from Mr. Grazebrook that Lyttelton is really Westcote, and that Lygon is really Pynder—not a Theban poet, but a useful parish officer disguised under a grotesque spelling. At the very beginning of the book, it is some comfort to find that the line of Urse of Abbotot has been extinct for some centuries, so that the curses of Archbishop Baldred did not go for nothing. But when Hugh Nash says—"again it is not Mr. Grazebrook that says—"that Urse was a brother of Hugh, Earl of Montgomery," we get a little puzzled, for who is Hugh, Earl of Montgomery? Possibly Hugh of Mont-

* *The Heraldry of Worcestershire*. Being a Roll of the Arms borne by the several noble, knightly, and gentle families, which have had Property or Residence in that County from the earliest Period to the present Time; with Genealogical Notes. Collected from the Herald's Visitations, ancient Manuscripts, Heraldic Dictionaries, Church Monuments, personal Seals, and other trustworthy Sources. By H. Sydney Grazebrook, Esq. London: J. R. Smith. 1873.

gomery, Earl of Shrewsbury. But if Urse was his brother, he must needs have been a son of Earl Roger and of the famous Mabel, which at once confounds all our notions. We are told also from the same Nash that "Urse's badge was a couchant bear; it is carved in stone on every corner of the steeple of Naunton Church, which was probably built by him." Unluckily we never were at Naunton, but we are filled with a strong desire to go there, as this badge-carving in the eleventh century would be something curious, if not unique. Directly after, we come to "Acton of Acton Hall, Ombersley, a family which, according to Habington"—again not according to Mr. Grazebrook—"existed in Worcestershire at a period anterior to the Norman Conquest." The one Worcestershire Acton that we can find in Domesday had belonged to the church of Evesham, but was then held by the Sheriff Urse under Bishop Odo. There were there "unus villanus, ix bordarii, et xii servi." Their descendants, when surnames came into fashion, would not unlikely take the name of Acton, and from them may very possibly spring "the various families of Acton formerly resident in this county." If so, their stock is at least English, and so far better than if they had come of Urse of Abbetot. Thus far we are in the region of possibilities, but we get out of them when Mr. Grazebrook quotes a certain Penn as affirming that certain Attwoods are descended from Simon of Montfort, on the strength of a lion with two tails. The Earl undoubtedly did bear a lion with two tails; but how came any Attwoods to be descended from him? In p. 47 we get the curious metamorphosis by which the Rev. Richard Tompkins in 1832 got changed into Berkeley. Mr. Grazebrook here throws the legend of the Danish Harding into a note, with a reference to somebody's manuscripts. So when he cites Nash as citing Habington for the statement that the "family of Blundell"—a family unknown to Domesday, as "Blundus" is more likely to be Blunt—"came in with the Conqueror and is mentioned in the roll of Battle Abbey," Mr. Grazebrook again warns his readers that "the roll of Battle Abbey is a very questionable authority." When Mr. Grazebrook comes to the alleged arms of William FitzAusculf, a real Domesday man, who was really lord of Dudley, he knows too well to commit himself to the doctrine that any man bore hereditary arms in the eleventh century, but leaves the fable to rest on the authority of Berry. So it is throughout; Mr. Grazebrook never pledges himself to any of the received nonsense, though he does not cast it aside—perhaps we cannot expect him to cast it aside—quite so merrily as we do. It is enough if Nash or Berry or Penn says some impossible thing; Mr. Grazebrook takes care never to make himself responsible for it.

At the end of the book are some lists of families, landowners, &c., in Worcestershire at different times, which have their statistical value; and some other lists which come more nearly to the nature of contributions to history. Such are the lists of the gentlemen who were fined for not receiving knighthood at the coronation of Charles I.; of "those gentry which are to find horse in Worcestershire" in the same reign; "of the lords, knights, and gentlemen that have compounded for their estates" when that reign was over; of the "knights of the Royal Oak," who never became such; and, lastly, "the names of Roman Catholics, non-jurors, and others who refused to take the oath of allegiance to George I."

VILLEMMAIN'S LIFE OF GREGORY VII.

THIS work of M. Villenmain's, though it comes before us as a posthumous publication, is so far from having been left in an incomplete state that it seems to have received his careful and sustained revision through many years. The Life itself was finished in 1834, but the author, regarding the pontificate of Hildebrand as—what in one sense it certainly is—the culminating point in the history of the Papacy, wished to prefix a dissertation on the rise and gradual development of that central power in the Church. This also he had completed in 1845, and from that time till his death, in 1870, he was constantly engaged in correcting, and to a large extent rewriting, the work which he had destined as his contribution to the study of history, and left after all in manuscript at his death. More than half the first volume is occupied with the preliminary sketch of Church history up to the middle of the eleventh century, and it is not till near its close that we reach Hildebrand's election to the Papacy.

Without committing ourselves to agreement with all M. Villenmain's views, we shall best consult the convenience of our readers by following the order of his lucid narrative; and this leads us, in the first place, to notice briefly the salient points in that marvellous course of providential development, or successful usurpation, or both together, according to the various estimates formed of it, which marks the growth of the Papal power. For, regard it as we may, a growth it assuredly was, and a very slow one too. Even in the fourth century, as the author justly observes, the See of Milan seemed more important than the See of Rome; and it was the Bishop of Hippo, not the Pope, who dominated the great African Councils of that period. Indeed the very circumstance which afterwards contributed so much to the aggrandisement of the Roman Church was, in the first Christian centuries, a cause of its obscurity. The Christians were lost in that vast metropolis of the world-wide Empire; and,

for whatever reason, very few men of mark appeared among the rulers or members of the infant community. No Church as yet made any pretence to authority over the rest, for the manifold letters and decrees subsequently fethered on the early Popes are now universally acknowledged to be spurious. Nearly all the Fathers and Apologists—and several, we may add, of the Popes of that date—were Easterns; and Tertullian, who was a Western theologian, but of Africa, not of Italy, simply ranks the Roman among the other "Apostolic Churches"—i.e. Churches founded by an Apostle—and, like many other Fathers, interprets the prerogatives conferred on St. Peter as personal, and not intended to pass to his successors. Two centuries later St. Jerome insisted on the equality of all bishops. The threat of Pope Victor to excommunicate the Asian (M. Villenmain says the African) Churches, if it proved his arrogance, also proved in the event his impotence. And, in fact, as our author rightly observes, every Church equally possessed at that day the power of excommunication, which only meant the power of declaring that it had itself broken off communion with some other diocese or province of the Christian Church. On the other hand, the comparative absence of the speculative spirit, which left the Western Church free from philosophical attacks and internal heresies, helped to consolidate its administrative and judicial power. "The heresies nurtured in Greece found their judges at Rome." And with the close of the era of persecution a new source of influence was opened to the Roman See. Within eight years of Diocletian's lying inscription which announced "the universal extinction of the Christian superstition," Christianity had become the religion of the Empire; and the first Christian Emperor removed his Court from Rome to Constantinople, not certainly from any desire to favour Papal pretensions, but as certainly with that result. The Pope became in fact, though not yet in name, the ruler of Rome. Then came the great Arian controversy, and Athanasius, as well as other orthodox bishops of the East who were oppressed by the Imperial Court, sought redress at Rome, till at last a sort of modified right of hearing appeals was conferred on the Pope by the Council of Sardica. But of Papal infallibility there was not the faintest notion. Athanasius and Hilary speak with indignant contempt of the apostasy of Liberius. The power of the Popes was administrative and practical, and they were habitually labouring to increase it.

What M. Villenmain says of Damasus is true of the great majority of the Popes; they showed a tenacity and active ambition of character which they seem to have inherited from the old Rome of the Republic and the Cæsars. Pope Siricius, the successor of Damasus, at the end of the fourth century, who censured clerical marriage in the first genuine Papal decree still extant, may in some sense be considered the precursor of Hildebrand; but when he summoned Flavian, Bishop of Antioch, to appear before him, his assumption of superior authority was contemptuously repudiated. To other, and sometimes questionable, means of increasing their influence, the Popes and Papal theologians of the fifth century began to add the more unquestionably illegitimate weapon of forgery, though it is probable that Innocent I. and Zosimus were not (as our author assumes) guilty of conscious imposture in confounding the Sardican and Nicene Canons. Gregory the Great was incapable of such crooked devices, but he did not shrink from using the services of the Emperor Phocas, who had gained his throne by the assassination of his predecessor, for the aggrandisement of the Roman Church, which however he also promoted, like many of his successors, by the nobler method of missionary enterprise. England and Germany were won over at once to Christianity and to the obedience of Rome. By that time the Papal power was so strongly consolidated in the West that even the notorious heresy of Honorius in the seventh century, and his public condemnation as a heretic by his successors and by three Œcumenical Councils, scarcely checked its advance. The real gifts of Pepin and Louis the Pious, and the fabulous "donation" and actual public coronation of Charlemagne by the Pope, all tended in the same direction.

By the middle of the ninth century Nicholas I. had established an absolute spiritual monarchy over the West, and had all but hopelessly alienated the Eastern Church. We need not follow our author through the dreary and too familiar tale of the dark period of corruption which set in soon afterwards. That the Papacy survived the age of Theodora and Marozia, if not with untarnished lustre, yet with undiminished power, has often been urged by Catholic apologists as a proof of its divine commission. Yet strong protests were heard even then, nor could any more sweeping denunciation of Papal arrogance be uttered than fell from the lips of Gerbert, afterwards Sylvester II., at the Council of Rheims, where the fallibility of the Pope was loudly asserted and his right to judge bishops as strenuously denied. He was actually described as Antichrist sitting in the Temple of God, and directly charged—the Syllabus not having then appeared—with the responsibility of the separation of the Eastern Churches. Of course Gerbert used different language when he became Pope; but Ultramontane writers did not easily forgive his inconvenient plainness of speech, and for centuries his memory lay under the reproach of an adept in the black art who had attained the supreme dignity in the Church through a compact with the Devil. With Benedict IX. in the next century, a boy Pope of ten years old, the worst excesses of the Theodora régime returned for a while, but it was the depth of darkness which comes before the dawn. In 1044 Benedict sold his triple

* *Histoire de Grégoire VII. Préface d'un discours sur l'histoire de la Papauté jusqu'à XI^e siècle.* Par M. Villenmain. 2 vols. Paris: Didier et Cie. 1873.

tians to the archpriest Gratian, for an annual payment of 2,000 silver lbs., and retired into private life; and when, four years later, Leo IX. mounted the Papal throne, the subdeacon Hildebrand became the actual master of its policy, though a quarter of a century had yet to elapse before his own election.

Hildebrand, then, the flower of his age, had attached himself for a time to the service of the anti-Pope Gratian, who took the name of Gregory VI., but after his deposition joined the next legitimate Pope, Leo IX.; who already began, under his guidance, to attack the two crying abuses of the Church in that day, clerical incontinence and simony. And while he thus endeavoured by disciplinary reforms to rehabilitate the moral power of the Church, which had been shaken by a century and a half of gross corruption in high places, he was no less vigilant in the cause of dogmatic orthodoxy. Berengar, a sort of mediæval Zwinglius, was first condemned for his denial of the Real Presence by a Council held at Rome under Leo IX. in 1050. Though sprung, like so many of those who have risen to the highest eminence in the Church, from humble origin, and not yet in priest's orders, Hildebrand exercised a dominant influence over the election and policy of the next four Popes. But when his own name was proposed on the death of Victor II., in 1057, he declined the honour, as his biographer says, "ne s'avançant que par degrés aux merveilles de sa vie, n'était pas mûr pour cette élévation." By his advice Nicholas II. introduced the famous change in the method of Papal elections which transferred the suffrage from the Roman clergy and people to the College of Cardinals—an important change, no doubt, but hardly what M. Villenain calls it, "the greatest revolution in the hierarchy since the time of the Apostles." The people, however, were still allowed to signify their assent, and the decree contained a rather vague reservation of the rights of the Emperor, which has sometimes been quoted, absurdly enough, as the origin of the veto exercised in Conclave during the last two centuries by certain Catholic Courts. Nicholas, who fully appreciated the commanding genius of Hildebrand, made him archdeacon of the Roman Church. It was he who secured the election and recognition of the next Pope, Alexander II., against the nominee of the Emperor, Henry II., then a boy of twelve, and, through his counsels, Alexander seized the opportunity of extending the temporal claims of the Holy See by excommunicating Harold, and solemnly conferring on William the Conqueror the Crown of England. In return for these services, and for his ready compliance in deposing the Archbishop of Canterbury and other Saxon bishops whom the Conqueror wished to replace by Normans, the Pope obtained a grant of what he termed "the ancient tax" of Peter's Pence from England. Alexander's last act was to summon the youthful Emperor to appear before his tribunal at Rome. On his death Hildebrand no longer opposed the unanimous desire of the clergy and people of Rome, who declared that "St. Peter had elected him," but he had the discretion to await the formal consent of the Emperor before receiving consecration, which had in his case to be preceded by ordination to the priesthood. And thus we are brought at length to the commencement of his own reign, which lasted only twelve years, but affected, more vitally perhaps than any single pontificate before or since, the future fortunes of the Western Church.

It would of course be impossible within our present limits to follow out the history of that eventful reign, which is well described by M. Villenain, and with the main incidents of which English readers are familiar in the brilliant essay of the late Sir James Stephen. Reference has already been made to the two leading objects of the Hildebrandine policy. Gregory was resolved to reform the morals of the clergy—marriage and concubinage being confounded under the common term "fornication"—and to put down simony; in other words, to enforce the rule of clerical celibacy and the prohibition of lay investiture. At the very first of the annual Councils held at Rome during his reign, at which, however, no German or Lombardic bishops were present, he not only pronounced the absolute suspension of all married and simoniacal priests, but took the decisive and wholly unprecedented step of publicly exhorting the laity to reject their authority and refuse the sacraments at their hands. His letter on this subject, addressed to the people of Franconia, and preserved in contemporary chronicles—it has been prudently omitted in the pontifical registers—is so remarkable that it deserves to be put on record here:—

Audivimus quod quidam Episcoporum apud vos commorantium, aut sacerdotum, et diaconum, et subdiaconum mulieribus miscerentur aut consentiant aut negligant. His præcipimus vos nullo modo obedire, vel illorum præceptis consentire, sicut ipsi apostolicæ sedis præceptis non obediunt neque auctoritati sanctorum patrum consentiunt. Testante divinâ scripturâ, facientes et consentientes par peccata complectitur. Sciunt namque Archiepiscopi et Episcopi terræ vestre, quod omnibus fidelibus notum esse debet, quoniam in sacris canonibus prohibitum est ut hi qui per simoniacam hæresin, hoc est, interventu pretii, ad aliquid sacrorum ordinum gradum vel officium promoti sunt, nullum in sanctâ ecclesiâ ulterius ministrandi locum habeant, nec illi, qui in crimine fornicationis jacent, missas celebrare aut secundum inferiorem ordinem ministrare altari debeant. Et infra: Quapropter ad omnes de quorum fide et devotione confidimus nunc convenimus, rogantes vos et apostolicâ auctoritate admonentes ut quidquid Episcopi dehinc loquantur aut taceant, vos officium eorum quos aut simoniaci promotos et ordinatos aut in crimine fornicationis jacentes cognoveritis, nullatenus recipiatis. (*Balz, Miscellanea*, t. VII, p. 125.)

The new law was strenuously resisted in Germany and other European countries, including England, where clerical marriage was the ordinary practice; at a Council held at Mayence so loud an outcry was raised that the Papal Legate confessed himself con-

vinced of the impossibility of suppressing a custom so ancient and so deeply rooted. The clergy were especially indignant at a method of procedure which, as they complained, by a reversal of all ecclesiastical order, made the people their judges; and where Gregory's commands were carried out scandalous scenes frequently took place in churches, the Eucharist, consecrated by married priests, being scattered over the pavement. But popular sympathy and, it is fair to add, the higher moral sentiment of the age were with him. And in both his great objects Hildebrand ultimately triumphed, though the triumph was a partial one, and in one case at least he might perhaps himself have admitted, could he have foreseen all, that it was too dearly purchased. The investiture controversy, raised at the second Roman Synod he held in 1075, was settled half a century after his death, at the first Lateran Council, by a compromise favourable on the whole to the claims of the hierarchy. Clerical marriage was eventually suppressed; but concubinage—to say nothing of worse vices said to have been almost universal at the time among the Italian priesthood—was not so easily disposed of. From that day to this we have an unbroken chain of evidence, resting on the most unimpeachably orthodox authority, of the wide prevalence of concubinage among the Catholic clergy, which is indeed only too notorious in South America and in some parts of Europe at the present day.

It would be a curious speculation, but one which we cannot pause to enter upon here, what Hildebrand would think, were he living now, of the net result of his policy with the light which an experience of eight centuries has shed upon it. In making the Roman Catholic priesthood into a caste, separated from the laity by a rigid line of demarcation unknown to any other communion in East or West, his success has been complete, and it has proved a source of enormous spiritual power. But the question, even viewed from the strictly Catholic standpoint, must be admitted to have two sides to it, and the moral cost of the achievement has been unquestionably tremendous. On that point we cannot enlarge now. Nor can we linger here over the details of the long quarrel with the Emperor Henry, which occupied and embittered the whole course of Gregory's pontificate to its very close, and found expression in his dying words:—"I have loved justice and hated iniquity, and therefore I die in exile." The familiar but romantic story of Henry's humiliation at Canossa in January 1077, in the midst of "the longest and severest winter of the eleventh century," is told with elaborate minuteness by M. Villenain. We can only find room for a small part of his graphic description:—

Henri, qui tant de lenteurs désespérait et qui craignait d'être absent trop tard, sans attendre une dernière réponse du pape, s'était avancé jusque sous les murs de Canossa, vêtu de deuil, avec les excommuniés de sa suite; et, frappant humblement à la porte de la citadelle, il demandait qu'on lui en permit l'entrée. Admis seul dans la seconde enceinte, au dehors du château, il y demeura les pieds nus sur la neige, attendant jusqu'au soir par le froid rigoureux de ce mois de janvier. Il revint, les deux jours suivants, faire au même lieu la même pénitence, et attendant la grâce du pardon apostolique, il était là pleurant. Las, enfin, de cette rude épreuve, il voulait se retirer; mais auparavant il entra, près de là, dans la chapelle de Saint-Nicolas, et, les larmes aux yeux, il supplia pour la dernière fois l'abbé Hugues d'être son garant: "Cela ne se peut," répondit l'abbé. Mathilde, présente à cet entretien, parut touchée de l'humiliation d'un prince, son parent, et, comme lui, elle pria l'abbé. Mais celui-ci répondit: "Personne, si ce n'est vous, comtesse, ne pourra réussir à cela." Le roi, fléchissant le genou devant elle, lui dit alors: "Si tu ne viens à mon secours, je ne briserai plus jamais de boucliers, car le pape m'a frappé et mon bras est mort. Ma cousine, fais qu'il me bénisse, va." Mathilde se levant donna sa parole au roi et remonta dans le château, près du pontife. Là, elle le supplia de finir la dure pénitence du roi. Les seigneurs italiens qui entouraient Grégoire VII étaient émus de pitié, et, malgré leur pieuse admiration pour le pape, ils accusaient hautement sa rigueur. Enfin, après beaucoup de discussions et de prières, il parut se laisser vaincre, et déclara que si Henri venait, résolu de confirmer avec serment, par lui-même et par les garants qui lui seraient désignés, toutes les clauses d'obéissance et de satisfaction que le pontife de Rome pourrait lui imposer pour l'utilité et la maintien de la sainte Église; que si, de plus, il promettait de renouveler dans la suite la foi de ce serment entre les mains des garants déjà réunis, de l'impératrice encore absente, il ne refuserait pas de le recevoir dans la communion chrétienne seulement. Du reste, se réservant de juger le roi dans une diète, il voulait que jusqu'au jour de cette sentence suprême Henri ne gardât aucun appareil, aucune marque de dignité, qu'il ne se mêlât point des affaires publiques, et, hormis la levée des taxes royales nécessaires pour sa subsistance et celle des siens, ne fit aucun acte de pouvoir et de royauté. Il exigeait, de plus, que tous ceux qui avaient jadis prêté foi et hommage au roi demeuraissent déchargés de leurs serments, et que le prince continuât d'éloigner de sa personne Rupert, évêque de Bamberg, Cric de Cusheim et les autres dont le commerce lui avait été interdit. Enfin, pour dernière condition, si le roi manquait à quelque-une de ses promesses, cette absolution demandée avec tant d'instance deviendrait nulle, il serait tenu pour condamné par son propre aveu, n'obtiendrait plus audience pour se justifier, et les princes, libres de toute entrave, éliraient un autre roi.

These terms, hard as they were, had to be accepted with some slight modification:—

Ces préliminaires une fois solennellement scellés, le quatrième jour de la pénitence, le 25 janvier au matin, le pape permit que le roi parût en sa présence. Il entra, la plante des pieds nue et encore glacée par le froid, avec les autres excommuniés qui pleuraient comme lui, et, se jetant le corps étendu en croix, il s'écria: "Pardonne, bienheureux père, pardonne!" On dit qu'au milieu de ce spectacle d'humiliation, Grégoire VII versait lui-même des larmes abondantes, soit qu'étant homme il ne pût se défendre d'un sentiment de pitié pour un si grand abaissement de fortune, soit que, prêtre convaincu dans l'ardeur de foi mêlée à ses passions, il fût touché du retour de ces âmes naguère perdues, que son pieux orgueil croyait sauvées par le pardon qu'elles obtenaient de lui.

The truce, however, was of very short duration. Henry was soon again at open war with the Pope, who in 1080 solemnly excommunicated and deposed him for the second time, and set up Rudolph of Swabia as Emperor. But Rudolph was conquered and slain

in battle, and Henry had himself publicly crowned in the Lateran Cathedral by Guibert of Ravenna, whom he had established at Rome as anti-Pope under the name of Clement III.

Gregory died a voluntary exile at Salerno, May 4, 1085; but he hardly needed the proud assurance of one of his attendant prelates that "the Vicar of Christ can never really be in exile, who has received the nations for his inheritance and the whole world for his possession." He knew that his cause had triumphed. And, as he had in fact chosen his four predecessors, so with almost dying breath he named his two next successors in the Papacy, Victor III. and Urban II., the latter of whom ten years later preached the first crusade at Clermont, and thus roused all Europe to carry out another great design which Hildebrand had planned, though he did not live to execute it.

M. Villemain has not, as his table of contents had led us to expect, attempted any final summary of the character and influence of this grandest of the long line of Roman pontiffs. Perhaps he is wise to let his readers draw their own conclusions; at all events, want of space compels us to follow his example. The best epitaph of Gregory VII. may be read in the fact that he found the Papacy the cat's-paw of schemers and courtesans, and left it in all but name a theocracy.

UPS AND DOWNS.*

WE are glad to come across a book like *Ups and Downs* which reminds us, by its quiet story of domestic life in America, how on the other side of the Atlantic there are thousands and tens of thousands of homes of which the telegraph tells us nothing and of which newspapers never write. We are too apt to think of the United States as of a country of Erie Rings and Tammany Halls, of "six-shooters" and bowie-knives; where steam-boat-boilers are always bursting, and railway bridges always breaking down; where rogues, instead of standing at the bar, sit on the Bench; where swindlers, if only on a big scale, are financiers, and where blustering bullies, if only engaged in an international arbitration, are jurists and patriots. We are too apt to think of New York and the *New York Herald*, of Congress and General Butler, of Bennett, Fisk, Jay Gould, Hamilton Fish, and Calch Cushing. We call to our mind too often the vulgarity which disgusts the traveller, and we forget the home life of which often enough the traveller sees nothing. Such a book as this reminds us that beneath all this froth—and very foul froth too—that is tossing about on the surface, there is ever running a deep stream as pure as it is quiet. We find in it a set of steady middle-class folks who, for all that we are told, are as indifferent towards England as the ordinary Englishman is towards America, who are too much engaged in making love, in making their way in life, and in making the two ends meet, to have time to think of the British Lion and the American Eagle. We find, instead of the rash fierce blaze of riot in which the New York shoddy world so much delights, a life as homely and as picturesque as any that Mrs. Gaskell or George Eliot has described. Indeed we do not know whether the American provincial life is not more picturesque and more quaint than any we can find even with all the advantages of an old country. Mingled with the sober Puritanism of New England, which Hawthorne has so well described, there is to be found, from the constant and varied streams of emigration that set to its shores, the light-heartedness of the Celt, the homely simplicity of the German, and the still homelier simplicity of the Norwegian and the Swede. With all this there is the absence of grinding, depressing poverty, and the presence of nature still wild and untamed. To simple descriptions of such a simple life as this we gladly turn away from the extravagant novels of the present day. As we read such a book as *Ups and Downs*, we get a kindlier feeling towards the honest folk of the North-Eastern and North-Western States, and feel ready to pity them rather than to condemn them for having at the head of their country so unprincipled a crew.

The plot of *Ups and Downs* is after that good old fashion of which so many of us never get tired. We have an honest young fellow pushing his way in life, up one time, down another, but always with a steadfast cheerful mind, hating everything that is mean, and loving everything that is good in general, and a very pretty heroine in particular. We have, no doubt, a good deal of that bread-and-butter love which Bocky Sharp so much despised; but then, to our taste, after the highly seasoned food which the novelists serve up to us in all the wearisome sameness of their three courses, this kind of love is still fresh. We have incidents enough to keep us interested, without troubling us to be excited, and we have a certain quiet humour into the bargain. We would not be understood to say that there is any wonderful merit in this story. We read it indeed all through without caring to skip, but then, on the other hand, we should never dream of reading it a second time. It gives us a lively description of a kind of life which is known to us only through books, but which in itself, unlike so many of the kinds of life that books tell us of, is natural enough. The hero of the story, Jasper Rising, is a young graduate of the American Cambridge. The story opens the evening before the Commencement at which he was to take his degree, and to bid farewell to his old University. The short description given here of College life and College customs is interesting

enough, and truer, we hope, to nature than those which are so often given of our own University life. But over this description we cannot linger, for we must hurry to introduce the hero, and our readers at the same time, to the heroine. This same evening he has to drive into Boston, and there, having the good luck to find a boy lying in the street with a broken leg, is at once secure of a sweetheart. For boys who publicly break their legs have sisters, and young heroes who pick up boys with publicly broken legs have a knack of falling in love with sisters. But Jasper did not fall in love at once; for, to quote our author's words:—

This fearful, brown-faced Bertha, who had hardly made out his German, and hardly made him understand hers—this girl of the heavy shoes, the loaf of bread, the freckled face, and the wounded brother, was to be the woman to whom Jasper was one day to give the whole treasure of a man's love, and who was to give him the whole treasure of a woman's. Neither of them dreamed of this, this evening, nor thought of the other for a moment. But, after many up and downs, this was to come. And to tell the progress of these ups and downs is the business of this story.

The next day, after the triumph of his speech at the Commencement, he learnt, just when all the world was young and all lay open before him, that his fine prospects had been shattered at a blow. One of the great American fires had killed his uncle who had adopted him, and swept away all his property at the same time. He hurries off to his desolate home, and going by New York catches a second glimpse of Bertha. She was the daughter of a poor German music-master, whose love for music never let him know that he was poor, and who had but lately come to live in America. He had in New York a wealthy brother-in-law, and Bertha, her brother, and her mother were going to his house by the same train that took Jasper. Now we must protest, whatever may be the exigencies of a hero and a heroine, against a lad with a broken leg being sent, two days after his accident, a long railway journey by the doctor's orders. It surely does not require so severe an accident as a broken leg to bring lovers to each other's knowledge. A sprained ankle has been known to suffice. Jasper renders all the help he can, and then sets off to Michigan, where his uncle had lived, to look after his own affairs. He finds scarcely any property left, and has soon to consider what a gentleman must turn his hand to "who has received the best education his country could give." After making all sorts of trials to get gentlemanly employment, he at last gives up the attempt in despair, and earns an honest penny by cleaning down railway carriages. "As he brought to light the hideous arabesques of the car-paint from beneath the charcoal dust and mud which a smart shower had plastered on them, he knew indeed that his lowest descent was over, and that he was beginning to rise again." He rose so well that at last he found himself one of three partners in a small carriage-factory in Detroit. Things were going on prosperously with him, when cholera swept through the city, carried off his two partners, and brought his business to an end. But meanwhile Bertha had passed from childhood to maidenhood, and from New York to Michigan. Her wealthy uncle and aunt would willingly have brought her up as their own child, but she—with a feeling which, if as common as Mr. Hale describes, is most honourable to America—wished to work for her own livelihood. But here our author shall speak for himself.

And so it happened—of course, for these people lived in America—that Bertha began to occupy herself with thoughts as to what she could do to earn her own bread and butter, her cotton, woollen and linen, and withal her shelter over her head. That is to say, she began to think that she must not live at her father's charge any longer, nor at her uncle's, and to look with an inquiring look upon the shop-girls who sold her tape and needles, and to wonder how they got their places, and who hired them. She looked with a supreme admiration upon the school-mistresses, called "teachers," in the public school where her brothers went. But she did not aspire to a destiny so ennobled as theirs. To her father and mother she knew she should never dare to speak or to write of these day-dreams. But none the less did she dream them; and she was soon resolved that they should not be always dreams, but should become realities.

Her aunt in her girlhood had had the same longings, and so, though loth to part with her niece, willingly helped her to find a governess's place. Mrs. Rosenstein, who engages her, is a cleverly-drawn character, and in point of vulgar insolence shows, if indeed any further evidence were wanting, that the New World fully equals the Old. Jasper and Bertha before long meet at a party to which the whole city is asked, and Jasper begins to think of other things besides carriage-building. Some months before this, while he was still engaged in car-paint cleaning, he had won the friendship of a young Norwegian lad named Oscar, who, like himself, was all adrift in the world. The friendship of these two is very prettily described; and so is Oscar's friendship, of another, though scarcely of a deeper kind, for a very sweet young village school-mistress—a school-ma'am, as the name goes in America—who before long is introduced. Oscar is struck down by the cholera; but among the hospital nurses is found Bertha, who had left Mrs. Rosenstein, and was on her way home when the illness burst on the town. She and Jasper nursed the boy through; and when the time comes for giving him plenty of change and outdoor air, they find room at the same time for some of the good old-fashioned love-making. Jasper is on the point of owning his love when she receives a letter from her father, telling her that his only brother had died in the East Indies, and that he was heir to his large fortune:—

At this moment, indeed, he made one of the great mistakes in his life by keeping silence. And as he thought of it afterwards, and repented of it bitterly, he was afraid that it was a mistake which came from reading artificial novels, and seeing artificial plays; for he had done just as the paper hero has to do. He had refrained from telling Bertha how he loved her, from the stupid fear that she would think he was mercenary and mean.

* *Ups and Downs: an Every-Day Novel.* By Edward E. Hale, Author of "The Man Without a Country," "Ten Times One is Ten," "How to Do It," &c. London: Sampson Low & Co. 1873.

Mr. Hale goes on to add:—

Let the American boy or girl remember that it is not safe to take the illustrations in English or French novels for the guidance of our simple American life.

The English boy and girl, we are quite sure, need to be reminded as much of the same thing, if they would make their lives simple and natural. The old music-master, who is indifferent to money, is annoyed to find that he must go to Europe to establish his rights, but, when rumours come that there are some claimants as children to his brother's property, he flatly refuses to go to the East Indies for all the money in the world. His brother-in-law in Germany was indignant at seeing the calumny with which he looked on the whole matter, and "when the old music-master called God to witness most seriously and reverently that it was only for the children that he cared for it, or thought of it, that Margaret did not care, and that surely he did not care," Friedrich Baum

interrupted the sentiment by his protestations of his convictions that the William Schwarz was a liar and a cheat; that he was in league with Jellaby & Jellaby; and that they were in a league with him; nay, he went so far as to imply that the English courts were no better than they should be; and that, not till justice was administered in Singapore as it was administered in the southern provinces of Denmark, or in the free city of Hamburg, and by the same forms, would he, Friedrich Baum, believe that this William Schwarz was anything but the vilest of impostors.

It seemed at last to be clearly proved that the deceased brother had left children, and that therefore his brother Max had no claim even to a dollar. "The pastor," who had helped him very much in the measures he had to take, "was sympathetic, but even a sympathetic pastor cannot by his unaided good wishes kill three nephews on the other side of the world, far less can he cancel their past existence when they have been in operation twenty years and more." Bertha and her father return to America as poor as they left, and Jasper, who manages to meet her again, at last summons up courage to propose to her. He tells her how he had loved her all along, and had been on the point of asking for her hand when the letter came saying that she was an heiress. He cannot at first get her to speak, and still goes on pleading his suit. But

Bertha still said nothing. They walked a hundred paces, and she said nothing. And Jasper fully trembled in his terror. But he forced himself to say—

"You are trying to spare me great pain."

"No, no," she faltered; "but, Jasper, why did not you speak then?"

They of course soon get married, for Jasper is in rising in the world, having become the editor and part proprietor of a newspaper. When he ventured to stand away for two or three days from his paper to go a-courting, he bound over the sub-editor under a solemn oath to discuss only "domestic service, and the independence of the judiciary, and religious toleration, and the other safe subjects, and not to launch out into those forbidden themes which, between ourselves, no one living understood as Jasper Rising thought he did." And, when he took a whole week to get married in, he bound him over under an equally solemn oath, "not to say 'commence' for 'begin,' nor 'in our midst' for 'among us,' nor 'we nibbled our pen,' nor 'we laughed in our sleeve.' We wish, before Mr. Hale turns author again, we could bind him over under a solemn oath to spell "honour," "parlour," "colour," "labour," "humour," and the rest, as all English-speaking people ought to spell them. A publican who pays so much a letter for all inscriptions may perhaps be excused if he cuts down "parlour" to "parlor." But who can believe that love can be made in a "parlor"? Who but a rogue would cheat "honour" of one-sixth part of its belongings, and who that has an eye for anything has "an eye for color"? Mr. Hale writes too pleasantly and too picturesquely to follow in the lead of those ignorant writers who have learnt just enough Latin to enable them to blunder in the spelling of their own language.

ENGLISH MATRONS, AND THEIR PROFESSION.*

MOST books owe a vast deal to chance. As the reader, on first taking a volume into his hands, happens to light on what engages or repels him, he addresses himself to a more serious perusal attracted or prejudiced, and is very apt never to shake off the first impression. Obviously this must be the case where the writer is unequal, and does not know the measure of his own powers; and especially where a limited experience is made the basis for the widest generalizations. Real experience, honestly stated, is a power which tells at once on every candid mind. The inferences drawn from it are altogether another matter, depending on a great many other things than trust in the veracity and good intention of the narrator. Nor is it only that fact and experience are in themselves more weighty than are, in most hands, deductions from them; they impress their superiority by the very different style in which they are delivered. Experience is, as it were, a witness on oath, and expresses itself with caution and gravity; deductions and assumptions set tongue and pen at liberty, and open the door to fancy, temper, and bias. The book before us, *English Matrons*, which has grown out of two lectures delivered in 1871 at the meeting of the Social Science Association, is made up in very unequal portions of experience and argument; and the reader—at any rate the male reader—estimate is very likely to be formed precisely as he finds himself engaged

on one or the other. If he opens where the authoress expatiates on the steady growth of injustice in man, and on the wrongs which woman suffers at his hands, and finds himself addressed as her sovereign and subjugator in a tone avowedly that of the Impertunate Widow, but tinged with a modern dash of flirty querulousness which does not add to its dignity—for surely the widow of old would never have apostrophized the unjust judge as one of that "amazing sex"—if he lights on the threat that, unless he treats his subject better, man as such "must become the object of woman's distrust and dislike," or on the warning to women who "venture to marry" in the present state of the law, "that their condition will be more unsafe than ever," or on the prophecy that women who cannot or will not resist man their oppressor "must become more and more helpless, cunning, and slavish, and must bring forth more and more abundantly the immoral fruits of slavery"—he will think that he has heard all this before, and will see nothing in the new way of telling either to recommend or enforce it. He finds the writer resenting the powerlessness of woman:—"They who are placed by the State in a condition of perpetual pupillage and subjection cannot, as a rule, exert much moral influence over those that are free"; and he doubts whether woman emancipated under her training would exercise over himself personally a more persuasive power.

It is part of the policy of social revolutionists to alter the meaning of words. Certain words cannot be done without, but they may be made to convey new and even contrary ideas, and in a manner be turned against themselves. Thus an idea of privacy attaches to woman's work and office, which the words Matron, Mother, and Home in their familiar meaning all encourage. All these are now invested with a new and enlarged significance and are constituted public offices. "By matrons," we read, "we do not understand married or elderly women only—we mean all women of whatever age who accomplish any part of the home creating or maintaining work. . . from the princess who makes a home for our future king . . . down to the little maiden in the scullery, who, without knowing it, is helping to maintain order, &c." By the term mother we are not allowed to suppose any necessary connexion with maternity; the house-mother is independent of such material relations. By home "we are not to understand merely, or even mainly, a man's private house; we are not thinking only of the individual home of the private family." Especially we must learn that the ideal home is not subservient to a masculine head, graced by the title House-Despot; and that while Home in its largest and fullest sense may exist without man, no home is possible without woman. Nay, the very term Man is shorn of its strength, and "mannish writers" are sneered at; by which phrase we are to understand, not women who affect a manly tone, but men who write like men because they are imbued with the weaknesses and stupidities of their sex. It is very important to arguments carried on in this Amazonian spirit to extend the crowning titles of womanhood—to enlarge the franchise, as it were; for wives come off but poorly. They have "ventured," and given in; some of them openly and selfishly declare themselves satisfied with things as they are, and are called drawing-room toys for their pains; while we are led to suppose that the sex as a whole groans through all its ranks, that women feel their intellects deliberately dwarfed—lest culture should awaken power—that a weight of unjust laws grinds them down on the one hand, and neglects and throws them over on the other. If a class our authoress among social revolutionists, her means rather than her ends for the most part justify the classification. She is no subverter of ranks and degrees, nor does her subject lead her to discuss the loftier pretensions of the movement; indeed we read long before we find a definite purpose, or anything more than vague, though violent, general charges; till suddenly, from a talk of woman's right to equal laws and equal opportunities, we come upon a demand for a monopoly of the most startling character. It is nothing short of exacting for woman as her right the whole teaching of the nation—high and low, boys and girls—up to the age of eleven. It is granted that she is incapable of this charge at present, because men refuse to educate her; but the privilege belongs to her in the nature of things, and it is men's business to fit her for it, and then to hand it over in implicit deference to her superior qualifications:—

Our next question must be, What is the proper educational province of these women educators and teachers? Besides that share in the education of our young nation which, whether we wish it or not, is and must practically be given to our matrons, I want to claim for women, first, far the greatest part of the education, and all the teaching, of all our children up to eleven years at least. After that has been provided for, considering the share women must of necessity have in the education of all, and that the teaching of our girls must be chiefly left to women, and will be always under their control—it is not too much to say that, in the work which remains to be done, women do and must share equally with men.

Proof of fitness to warrant this comprehensive demand is not necessary under the author's view; but the fact that a lady who has had great success in preparing children for public schools thinks with her is given as conclusive. It is her opinion that woman alone can ground thoroughly, that she alone can impart an exact thorough teaching of the first elements of knowledge, and lay a sound foundation in the habits of a child's mind. With such fundamental gifts, it certainly may surprise "the amazing sex" that women should develop into beings so utterly inaccurate, ignorant, and helpless as she describes them to be for the want of the privilege of man's preliminary training.

It is where our author, leaving theory and speculation on what her sex might be and do under wholly altered conditions, descends to her personal experience, that she becomes an authority.

* *English Matrons, and their Profession.* By L. E. M. London: Sampson Low & Co.

She has visited hospitals and workhouses, has nursed and has superintended nurses; and here we must say that our own limited knowledge of facts supports many of her statements of neglect and mismanagement, and disposes us to receive her suggestions with deference. Under the common hospital system, it would seem as if boards, subscribers, and patrons can do everything but secure to the patient the essential ministrations on which his recovery mainly depends. Doctors will differ in character as well as opinion; but it is not of the doctor that the patient complains in confidence; it is of the nurse—rough, rude, negligent, impatient, often defiant of the doctor's orders and contemptuous of his authority. The authorized presence of a trained and educated woman would be as welcome to the patient as it would be troublesome to officials of this class, and perhaps to the whole staff, who like things to go smoothly, and—encouraged in their objection to complaints by the fact that patients who bring them are commonly of the class who grumble because it is their nature to grumble, not from any good reasonable ground—make a principle of turning a deaf ear to them. It is not so easy to do so to a lady less dependent on their favours, though complainants will always be a nuisance, and suggest unfavourable comparisons with non-complainants—“We don't have these complaints from other wards.”

A whimsical application of this stereotyped answer was once made to myself. I had orders to feed up a patient, whose main support was eggs, with milk and brandy. The eggs applied to the hospital at the time were often bad, and, according to laws in such cases made and provided, I had to go down to the steward's office with my bin of bad eggs and get others in exchange. The clerk on duty bore this in silence for a couple of days; then, with a visible effort to control his displeasure, he exclaimed, “Really Mr. —, it's a most extraordinary circumstance that there are no bad eggs in any ward but yours.”

Certain it is that this lady's experience shows at once the usefulness of an educated woman of superior social position in the hospital ward, and her want of welcome with all but the patient; but the reader of some of these chapters may possibly see some reason for this less damaging to the parties reflected on than she may be cognizant of. There is an excellent passage on the training of the hand as an essential part of woman's education; though we believe that strength will always give to man's trained hand a dexterity of touch unattainable by woman. For this purpose she finds the piano perhaps the best training power, but sewing and knitting the most available for the masses. The part she gives to the needle in the education of the matron would satisfy the most old-fashioned requirements; it leads, however, to a demand for female inspectorships for schools and workhouses; all her powers of surcein being called into exercise on the fact of Government leaving this branch of supervision in the hands of men.

The whole book, so far as it is practical, involves an altogether new mode of training for old-fashioned duties. In the first place, funds must be raised for their adequate teaching, without which woman's mission stands still. Instruction is to be the first step, cultivation the next—forming between them the perfect matron, who is to be the source of that part of civilization which women are to supply. “Before we can secure any of it, we must have a generation of women who have themselves been civilized.” This is for the mother. The ideal scholar, educating herself for matronhood, is to have as exact a technical training for her profession as her brother has for his of soldier or engineer. This must begin at the age of twenty or twenty-one; her three subjects being household management, children and their primary instruction, and the laws of health in nursing the sick. The method of acquiring these looks all very well upon paper, but would certainly be found difficult in practice. Thus the young student is to take the temporary management of her mother's household, and to train the maidens to habits of economy, &c., forgetful of the fact that no servants will serve two masters, and that authority is not a thing transferable. In preparation for the family in the future, she is not to trust to instinct as though she were a sagacious cat, but to attend regularly and for a considerable time at a good infant school, extending her study to the German Kindergarten. This will take two years; a third year is to be spent in one of our great nursing schools. This course “will qualify her equally for superintending a great public institution or becoming on marrying a centre of civilization and moral culture.” Until women have educated men, perhaps such a centre of civilization will be beyond even their aspirations. Men's stomachs—that is, the stomach of their sense—are, as the good woman says, so comical in their present rude state, that they may like more private training, with all its shortcomings, under the notion of indoctrinating their wives with their own tastes, views, or pursuits.

We are not sure that a very narrow field of experience is not worse than general ignorance as the foundation for wide exhaustive theories. A little knowledge so soon embraces the whole field of inquiry. Thus the author's acquaintance with London poor leads her to misjudge all poor, a smattering of political economy induces her to decide in favour of gambling and horse-racing in men over female extravagance in silk gowns and ices at Garter's; newspaper philippics on modern servants lead her to denounce our present race of women servants as exceptionally incompetent and inferior in trustworthiness to men in the same calling. On all such points the reader will find himself with equal materials for judging with his author, and is very likely to have arrived at different conclusions. But where he differs he will still recognize an ardent zeal for the true interests of women, guided, we will add, by earnest religious and Christian principle.

SIR EDWARD CODRINGTON.*

(Second Notice)

IT had been agreed between Admiral Codrington and his Russian and French colleagues that the combined squadrons should come into the port of Navarino “in order to induce Ibrahim Pacha to discontinue the brutal war of extermination which he had been carrying on” against the insurgent Greeks. Accordingly on the 20th of October, 1827, Admiral Codrington's flag-ship, the *Asia*, of 84 guns, led into the harbour, and anchored close alongside a ship of the line bearing the flag of the Capitana Bey. Two other English line-of-battle-ships followed, and found “proper opponents” in the front line of the Turkish fleet. The Russian and French ships also placed themselves in suitable positions for effective action. The Admiral gave orders “that no gun should be fired unless guns were first fired by the Turks, and these orders were strictly observed.” The three English ships were accordingly permitted to pass the batteries, and to manoeuvre, as they did with great rapidity, without any act of open hostility, although there was evident preparation for it in all the Turkish ships. Upon the *Dartmouth* sending a boat to a Turkish fire-vessel, a lieutenant and several of her crew were shot with musketry. “This produced a defensive fire of musketry from the *Dartmouth* and the *Sydney*, bearing the flag of Rear-Admiral de Rigny; that was succeeded by a cannon-shot at the Rear-Admiral from one of the Egyptian ships, which of course brought on a return; and thus very shortly afterwards the battle became general.” The *Asia*, although placed alongside the ship of the Capitana Bey, was even nearer to that of Moharem Bey, the commander of the Egyptian ships; “and since his ship did not fire at the *Asia*, neither did the *Asia* fire at her.” The latter indeed sent a message “that he would not fire at all,” and therefore no hostility took place between the two ships for some time after the *Asia* had returned the fire of the Capitana Bey. In the meantime, however, the pilot of the *Asia*, who went to interpret to Moharem Bey the Admiral's desire to avoid bloodshed, was killed by his people in a boat alongside. His ship—whether with or without his orders is not known—soon afterwards fired into the *Asia*, and was consequently effectually destroyed by the *Asia*'s fire, sharing the same fate as his brother admiral on the starboard side, and falling to leeward a mere wreck. This account of the proceedings of the *Asia* would be equally applicable to the other ships of the fleet. “This bloody and destructive battle was continued with unabated fury for four hours,” and the scene of wreck and devastation at its close was such as has been seldom seen. The conduct of the Russian and French commanders was “admirable and highly exemplary,” and Admiral Codrington derived “able and zealous assistance” from his own officers. In fact everybody behaved as well as possible all round. The loss was severe, but the Admiral consoled himself with the reflection “that the measure which produced the battle was absolutely necessary for obtaining the results contemplated by the Treaty, and that it was brought on entirely by our opponents.” The whole story reminds us of the Irishman who could not expostulate because the poker was bent; but there is this difference, that the poker was not bent, and Admiral Codrington did expostulate.

Such is the substance of Admiral Codrington's official report of the battle of Navarino. In a private letter to the Lord High Admiral he says that it would have done his Royal Highness's heart good to have seen the tremendous effect of the *Asia*'s guns. Some idea of the severity of the action may be formed from the fact that the *Hind*, tender to the *Asia*, having taken a very warm place, was struck by twenty-three round shot, and her surgeon, when about to perform an amputation, was unbidden on deck by the call “All hands to repel boarders!” Thus the *Hind* got the name of “the line of battle cutter.” A general order issued by Admiral Codrington after the action stated that “the allied commanders promised to destroy the Turkish and Egyptian fleets if a single gun were fired at either of their flags, and with the assistance of the brave men whom they had the satisfaction of commanding, they have performed their promise to the very letter.” It might indeed have been expected that a Russian admiral would zealously co-operate with a British admiral in destroying a Turkish fleet “in the cause of suffering humanity.” Such an opportunity was not likely to recur. The *Gazette* announced that Admiral Codrington had been promoted from K.C.B. to G.C.B., and that all his captains and commanders had been made C.B. The Lord High Admiral officially congratulated Sir Edward Codrington on the splendid victory he had obtained, and rejoiced that he was quite well. “I admire,” he said, “your perfect conduct on the day of battle, and most highly appreciate the exertions of all ranks under your orders.” The Duke of Clarence's letter was to be delivered to Sir Edward by their common friend Admiral Sir John Gore, who proceeded, “with the approbation and perfect knowledge of the Cabinet, to obtain a complete and satisfactory explanation to certain questions which His Majesty's confidential servants have thought it their duty to put respecting the cause of going into Navarino Bay, and the commencement of the firing.” The Duke sent at the same time the insignia and crosses of the Bath, and a sword from himself, “which,” he said, “I trust you will accept as a small token of my admiration of your conduct in Navarino Bay.” In another letter the Duke says that, not being in the Cabinet, he can only look at the business as a sea officer, and from the bottom of his heart he congratulates

* *Memoir of the Life of Admiral Sir Edward Codrington: with Selections from his Public and Private Correspondence.* Edited by his Daughter, Lady Bouchier. 2 vols. London: Longmans. 1873.

the Admiral on the event. The Duke of Clarence was, happily for himself, exempt from sharing the political perplexities which Codrington's straightforward interpretation of ambiguous orders had produced. This perplexity was well described by a friend who wrote to Codrington that everybody at home admired his pluck and skill, but some doubted whether he had not knocked down the wrong man. Between sympathy with Greek independence on the one hand and suspicion of Russian designs on Turkey on the other, it was difficult for the English Government either to fix their own course or to give intelligible instructions to their Admiral. They might usefully have remembered a favourite saying of the first Napoleon, that you cannot make an omelette without breaking eggs. By the Treaty of London of July 6, 1827, Great Britain, France, and Russia agreed to propose and, if necessary, enforce an armistice by sea between Turkey and the Greeks. The naval commanders of the three Powers were instructed, in enforcing this armistice, "at the same time that they do all in their power to prevent collision between the two belligerents, to avoid on their part collision with either." The original edition of *Pickwick* contains a picture of the benevolent hero interfering to prevent collision between the rival editors of *Estanswill*, and thereby producing collision of his own person with a carpet-bug and hearth-brush. A British admiral could hardly be expected to imitate the meekness of Mr. Pickwick. Sir Edward Codrington entered Navarino to enforce the armistice on Ibrahim Pacha; his fleet was fired on and he returned the fire. A change of Government produced a modification of feeling; and although Ministers could not deny that Codrington had done his duty at Navarino, they removed him from his command on the pretext that he had not done his duty afterwards. His real fault was that he had done too much; but he was charged with having done too little. An attempt was made to propitiate the Turks by explaining to them that Codrington had been removed. The Reis Effendi could not make it out. "The notion that the Admiral had been remiss in the execution of measures of severity seemed to him incredible." We, like the Reis Effendi, cannot make it out. If Ministers had said plainly, We are going to conciliate the Turks, and we think that Admiral Codrington's presence in the Mediterranean may tend to keep alive unpleasant memories, their course would have been justifiable. It was for them to judge of political expediency, and, we should say, that it would have been the Admiral's duty to bow to that judgment even if he doubted its soundness.

The Duke of Wellington was the author of the resolution to recall Codrington. The letter of recall bears the signature of Lord Aberdeen, and we are obliged to say that it is not a creditable composition. The main charge was that the Admiral "ought to have prevented the transmission of Greek slaves to Egypt" after the battle of Navarino, and that, in failing to do this, he had neglected written instructions sent to him by Government. By one clause of these instructions he was directed "to hold out every inducement to the Pacha of Egypt to withdraw the Egyptian ships and land forces altogether from Greece, and to assure them that every facility and protection would be given for their safe return to Alexandria, but on no account to enter into any stipulation for allowing the ships to return without the troops to Alexandria." Lord Aberdeen argues that this instruction "necessarily authorized" the Admiral "to ascertain what the ships about to return contained." The fact was that some of the ships which had been severely battered at Navarino floated, and barely floated, across to Alexandria. The Admiral was required not only to permit, but to give "facility and protection," to their voyage; but he was not to "stipulate" for permission for this voyage unless the ships carried troops. But if the Admiral merely looked another way when ships came out of Navarino, it seems to us that he was within his orders. He allowed the voyage and he did not "stipulate" anything at all. He would, indeed, have encountered formidable difficulties if he had. There might easily have been, and probably were, many more Egyptian troops in Greece than the ships which put to sea could carry, even if they had been seaworthy, which they were not. Was the Admiral to superintend the packing of these troops into the ships, and ascertain the exact number which they could carry in ordinary weather without sinking? Lord Aberdeen argues that the Admiral ought to have searched the ships to see that they did carry troops, and that, if he had done this, he would have found Greek slaves on board, and could have taken them out. The deportation of these slaves to Egypt caused a great outcry in England, and the Government alleged that this order imposed on the Admiral a duty to prevent it. As regards the general duty of checking Turkish barbarity towards the Greeks, supposing such a duty existed, the task of discharging it, and at the same time avoiding any collision with the Turks, was almost impossible. We are not, however, concerned to maintain that Admiral Codrington did always the very best that could be done in circumstances of extreme difficulty. But we say that these difficulties ought not to have been aggravated by sending orders framed in ambiguous terms, and then censuring him for not interpreting these orders in a sense which, to say the least, is not obvious.

The battle of Navarino was fought on the 20th October, 1827, and in the December following the Ministry of Lord Goderich resigned, and was succeeded by that of the Duke of Wellington. The King in his speech to Parliament of the 29th January, 1828, was made to say that, notwithstanding the valour displayed by the combined fleet, he lamented that this conflict should have occurred with the naval force of his ancient ally; and he hoped that this "untoward event" would not be followed by further hostilities. The Duke of Wellington explained that by "unto-

ward" was meant "unexpected, unfortunate," and that no imputation was intended upon the gallant officer who commanded at Navarino. The Duke of Clarence had secured promotions and decorations for the Admiral and his officers before the political storm broke. But no thanks were voted by Parliament to the men who fought at Navarino. The letter of recall reached the Admiral in July following, and he returned to England. In January 1829 he called upon the Duke of Wellington, who assured him that he had the highest esteem for his conduct and services, but discreetly declined to argue the question of construction of the orders. During the remainder of a long life Sir Edward Codrington was treated with the consideration due to his brilliant services, and it may be taken as admitted by all parties that he was sacrificed to political expediency. A naval officer cannot take a lawyer to sea with him to interpret difficult instructions. But if he will do his duty faithfully to the best of his understanding, he may be sure that in the long run his country will do him justice.

TWO RECENT TREATISES ON ART.*

WE couple together Mr. Jackson's treatise on *Modern Gothic Architecture* and Mr. Moody's *Lectures on Art*, not because they have anything in common in their treatment, but because they arrive, by different paths, at the same result. They both represent the craving of the more advanced artistic thinkers of our time for some definite principles which shall give vitality and consistency and unity to the art of this nineteenth century. They both agree in a very low estimate of the eclectic and imitative schools of the day. They both look to the more perfect training of the individual artist as the only possible remedy for existing evils. Mr. Moody, as one of the South Kensington staff engaged in tuition, speaks with a practical as well as theoretical knowledge of the subject.

Mr. Jackson, whose name is not known to us in connexion with any architectural work in actual execution, avows himself a firm believer in the Pointed or Gothic school of art. But he is absolutely dissatisfied with the present state and prospects of the Revival. There is little that is new in his arguments, and his style is somewhat cumbersome and heavy. But it is a good sign that any of our young architects should take so earnest a view as he does of the responsibilities and capabilities of their profession. Starting from the assumptions that all good architectural art falls naturally into styles, and that all good styles are in some peculiar manner suitable to the country and age which gave them birth, he argues that the climate of England requires some variety of the Gothic style, and that the architecture of the future must be no servile reproduction of that of the middle ages, but rather a style which shall meet and embody the actual conditions of the civilization of our own days. Arguing from the precedents afforded by the revival of Roman architecture north of the Alps by Charles the Great, and by the revival of classical literature by Petrarch, he declares that as the one developed into Gothic and the other into the rich literature of modern Italy, so ought the revival of Gothic to have given place by this time to the birth of a new derivative style suitable to our own age. In other words, the revival of Gothic among ourselves, right and necessary as it was, ought never to have been regarded as an end in itself, but only as a means to some further end beyond. The question arises, What are the causes of the failure of this revival to give birth to a vigorous new style? Mr. Jackson finds the first answer to his question in the formalism and purism of the chief leaders of the school. He compares them to *littérateurs* who might devote themselves to reproduce Ciceronian diction rather than develop a verbal style of their own. He thinks they have mistaken the letter of the old Gothic for its spirit, and contends that they ought to have concerned themselves not with the forms, but with the principles, of the style. He concludes therefore that our best modern Pointed buildings are really pseudo-Gothic, and declares that the imitation of archaic drawing and sculpture is a senseless caricature, and generally that antiquarianism, as such, has been inimical among ourselves to the best interests of the art. English architecture, if it is ever to revive, must be Gothic, but Gothic without mediævalism. There is nothing new, as we have said, in these opinions. But they cannot be expressed too often. Mr. Jackson next contends that the growth, if ever it is to begin, must be spontaneous and natural. So that those architects are to be blamed who imagine that they can forward it by affecting a deliberate originality in their works. His condemnation of the extravagance and eccentricity of many modern designs, the overcrowding of incongruous architectural features, and the utter absence of repose or sense of harmony and beauty, is one of the most vigorous parts of his book. Our author goes on to argue that the key to the new style will most probably be found in the loyal attempt to supply in Gothic any modern wants which ancient precedents may fail to provide for. This is a new and valuable suggestion. It follows that the use of Gothic ought to be universal if this idea is to be carried out into practice. The man who foregoes any profitable occasion of applying the Pointed style to some new and difficult emergency is so far a traitor to the

Lectures and Lessons on Art; being an Introduction to a Practical and Comprehensive Scheme. By F. W. Moody, Instructor in Decorative Art at South Kensington Museum. London: Bell & Daldy. 1873.

style. We welcome Mr. Jackson's indignant protest against Gothic being considered as suitable for none but ecclesiastical buildings. We do not know, however, that we agree with him in thinking that purism is the besetting danger of a universal adoption of the style. He is more right, as it seems to us, in hinting that the early Renaissance will probably supply many invaluable hints and suggestions for such developments of the earlier Gothic as are wanted in our own days. But still more valuable are his concluding remarks that the *via salutis* will most probably be found, if found at all, in the restoration of the subsidiary decorative arts of sculpture and painting to their proper relation to the mistress-art of architecture. Here Mr. Jackson becomes almost eloquent in his description of Greek sculpture and of the paintings in the Campo Santo of Pisa. He finds his best illustration of the utter want of harmony in our own days between architecture and the subordinate arts in the following description of a well-known London church:—

Let us take, as an instance of modern work, a church which was built not many years ago in London, which is well known and deservedly admired by all who are interested in the progress of architecture, and which, on account of its costliness and splendour, and the talent that has been expended on its design, is one of the most famous of our modern buildings. The architect and the painter to whom the principal part of the decoration was entrusted were both in the first rank of modern artists, and were selected probably because they belonged to the same school of religious thought, and were influenced by common sympathies and principles. It would perhaps have been difficult at the time when this church was built to have associated together an architect and a painter from whose united work a more harmonious result might have been expected. And what is the result? Simply contrast and discord. The part of the decoration which was designed by the architect himself is hard, dry, severe, and abstract; the design is sharp, trenchant, and in parts even spotty. In that part which was decorated by the painter the colouring is soft and flowing, the treatment broad, and the general effect warm and subdued. So far as concerns unity and harmony of effect, the result is a failure.

Mr. Jackson finds a still more notorious failure in the Houses of Parliament. The remedy is to be found in the more perfect training of the architect. The architect of the future is not merely to design the fabric, but to be responsible for all the sculpture and painting employed in its decoration. This again is no new idea. But is there any hope, we ask, of its being realized? No doubt it used to be so in old times. But then the subdivision of labour was not carried to the point to which the exigencies of our modern life have driven it. And the ancient artists were not compelled, by want of money or of fame, to undertake—as so many of our contemporaries persist in doing—very many more commissions than they can satisfactorily, or personally, fulfil. Mr. Jackson is perfectly right, therefore, in calling upon his fellow-architects to devote themselves to the study of pure art in all its applications, and more particularly in sculpture and painting. Undoubtedly an architect ought to know how his constructions are to be decorated. Whether he is to carve with his own chisel, or paint with his own brush, or stain glass with his own hands, is another thing. But at any rate he ought to be able to comprehend the whole, if he is to work in harmony with the artists associated with him in his task. It is a hopeful thing that some of our architects begin to understand this necessity, and some few at least have begun to practise it. The study of art in general, and of the nude in sculptural art in particular, is no longer a thing unknown among the architectural profession. It is now acknowledged that an architect must learn his business not only at the drawing-board in his employer's office, but in the life-school and in the picture gallery. Mr. Jackson deserves our best thanks for recommending this course to his brother architects. We hope that he follows his own prescription in his own practice. We are very glad to welcome him among the number of the lettered students of art. Many of his illustrations show reading and culture. The following is a happy description of the unintelligent imitation of ancient forms which characterizes certain modern designers:—

Our work will be like those strange copies of the religious woodcuts that were common in Europe during the sixteenth and seventeenth centuries, which were made by Chinese artists for the Jesuit missionaries in China, which have not the merit either of European or of Oriental art, and are evidently done by men working, as it were, in the dark, scarcely conscious of the meaning and intention of the lines and figures they were transcribing.

We have not left ourselves much space to speak of Mr. Moody's lectures. This volume contains the substance of a course which he delivered at the South Kensington Museum, as introductory to future courses on architecture, ornament, and the human figure. They are illustrated, in a rough way, by transcriptions of the lecturer's sketches on the black-board, each sketch being briefly described in letterpress. What he has not been able, however, to reproduce for his readers is the magnificent collection of actual examples of the highest art which the Museum afforded him for oral illustration to his hearers. We have often laughed at the charlatanism which has been so conspicuous in the management of the South Kensington Museum, but we are willing to admit that a more magnificent or valuable collection of treasures of art has never been accumulated. And it is with pleasure that we see in Mr. Moody's volume a proof that some of the professorial teaching delivered at South Kensington is altogether excellent. A tone of complaint, indeed, runs through the lectures, as though the students addressed were not very numerous or attentive. We hope that the teachers have no just ground for such complaint. At any rate there is no excuse for the neglect of such opportunities of study among the younger members of the architectural profes-

sion settled in London. Mr. Moody does not exaggerate the value of the Museum when he thus describes its contents:—

We have here under one roof treasures of such surpassing interest and in such profusion, that nothing comparable could have existed in the palaces of the Medicis or the Popes. The catalogue seems inexhaustible. Every material the earth produces is here to be seen—carved, turned, bored, twisted, melted, punched, blown, or beaten into every conceivable form of beauty that the taste, skill, or patience of man could invent or execute. What centuries of labour and experience are here stored for our use!

Nevertheless the lecturer insists most truly that nature, and not art, must be the chief educator of the artist. His address at the conclusion of the session, in which he deals with this point, is the best of the whole series. It is interesting, if the two books noticed in this paper are read together, to see how closely the writers agree in their idea of the only possible remedy for the low state of art among us. Surely this is a good sign for the future. How thoroughly Mr. Moody makes nature the inexhaustible fountain of all artistic inspiration can be best judged of by an examination of his illustrative plates. Nearly all of these are reproductions of natural form, and more particularly of the human figure. So thoroughly is he persuaded that the life-school is the nursery of the highest art, that he assumes a competent knowledge of anatomy in his hearers. We are sure, as we have said, that this is the right direction in which we have to look for real progress in English art.

HOME, SWEET HOME.*

MRS. RIDDELL has in her last novel made an advance, but at the same time she has retrograded. She has made an advance, inasmuch as she has taken the advice which was tendered to her long ago, and modified her habit of interlarding her narrative with those apostrophes to sacred names which recur with such distressing frequency in *A Life's Annals* and others of her works, and has expended more time and pains than is customary with her in the analysis of character. She has not, however, been able to refrain altogether from religious padding; a tablet to the memory of some drowned seamen afforded an opportunity for a bit of pious sentimentality too tempting to be passed by. In the matter of construction Mrs. Riddell has not in any way improved, and as regards originality she has fallen off. The plot is of the feeblest, if indeed it can be admitted that *Home, Sweet Home* contains a plot at all; and surely a less hackneyed subject might have been found for a story than the very commonplace one of an obscure girl with a lovely voice and the true genius for music taken up and trained by one of those ponderous fat, dirty, magnanimous, yet most small-minded, Germans, who are becoming as inevitable in our works of fiction as are Italian organ-boys in the streets of the metropolis. In short, this novel gives us the idea of an attempt to imitate George Eliot and Wilkie Collins simultaneously; while a strain of the genuine Mrs. Riddell is perceptible through the whole, and somewhat tones down its incongruities.

Home, Sweet Home is written autobiographically; and as the heroine who tells the story is, when we take leave of her, the mother of several children, we find that its action has extended over some thirty years. It is evident that we are intended to fancy the earliest events in it as taking place some forty or fifty years ago, for it must be quite as long as that since people in any part of England lived in such a quaint old-world fashion. Annie begins by describing a certain white house standing upon a steep green hill with a background of dark fir trees, extending into belts of plantation and sloping lawns; which house, having been for years the focus of all her dreams and speculations, "the Great House," the grandest habitation within her ken, has photographed itself upon her brain. As, however, she eventually comes to live in that very house, having married into the family of the Wiffordes of Lovedale, it is not surprising that she should know it well. Annie's relations are only farmers, tenants of the ladies who inherit the Great House; and the descriptions of her life with her grandmother, who considers that sailors and soldiers and restless idle vagabonds are the only people who go to outlandish places, and who never talks of anything out of "Fairshire," if a little spun out, are at any rate very natural, as also are the ways of the whole Motfield family, among whom Annie, the ugly duckling, is the cause of much heartburning, jealousy, and trouble. Annie's father has been a ne'er do weel artist, with whom her mother, a beauty, had, contrary to all Motfield traditions, eloped, and both had died after a few years of love and misery, leaving Annie to inherit unacknowledged genius—which is only a burden to her—three hundred pounds, a silver tea-service, an old spinet, some paintings, books, and brocades, all of which are objects of envy to her aunts and cousins. It is by these farmers' wives and daughters that we are reminded in a sort of way of George Eliot, just as one is sometimes conscious of, as it were, the echo of a perfume without being exactly able to define what essence has given it birth. These portraits are very deficient in the delicate handling by means of which the author of *Adam Bede* makes her people live and breathe; yet there is a rough truthfulness about them which bears a certain resemblance to the creations of that wonderful limner. Annie, vaguely aware that she has music in her soul, learns for the first time the power of sweet sounds when staying at Fairport with her uncle; for she by a fortunate chance is taken to the theatre, and hears some

* *Home, Sweet Home*. By Mrs. Riddell, Author of "George Geth," &c. London: Tinsley Brothers. 1873.

wandering stars, of whom Serlini, the prima donna of that day, is the queen. After a tumultuous encore, the Diva sings a plaintive well-known ballad, "Home, Sweet Home," and sings it so that the child artist is moved to tears. Afterwards Annie sings it for herself, wandering away where she thinks she is alone, and carolling forth her song so that the very thrush is forced to stop and listen to her. She has chosen rather an inconvenient spot for her concert-room, a boulder in the middle of the river Love; yet here she is joined by another water sprite, no less a personage than the young lady from "the Great House"—a hoydenish, fast, and flighty damsel, who, being wearied with the dullness of her stately home, and very glad to discover a congenial companion in the farmer's daughter, makes the preternaturally sagacious observation that "genius has its own rank," and forthwith proceeds to patronize and to bully Annie. The one-sided friendship which arises between the girls being displeasing to the antiquated spinsters whose aim in life is to keep up the dignity of the Wilford name, Mrs. Motfield and Annie leave Lovedale, and make a new home in Annie's own cottage at little Alford, where the heroine attends a school of local celebrity, and makes acquaintance with a certain Dr. Packman, the stereotyped amiable country physician we know so well, and with his old-maid sister. At their house she is introduced to Herr Droigel, the before-mentioned German professor, who becomes the arbiter of her fate.

Undoubtedly the Droigel family are the best drawn characters in Mrs. Riddell's book, and have had most pains bestowed upon them. Annie is merely an amiable nonentity with a voice; Miss Cleves is a rough young person who, in affecting singularity, does not mind wounding other people; the Motfields are sketchy, but tolerably faithful, presentations of individuals of their class; and Serlini and the other musical people have been merely thrown in to fill up the canvas; but upon Droigel, his wife and daughter, the authoress has expended all her strength, and we are bound to say that she has not expended it in vain. Droigel, with his immense untidy person, his acreage of fat cheek innocent of whisker, huge dirty hands, and divine voice, cooking his fearfully composed messes to the great discomfiture of any servant who may have been inveigled into accepting for a brief period an engagement in the family, which delighted to live "in a hurricane of disorder," and bellowing from the fireplace an entreaty to his pupil to mind what she is about, or a malediction upon her for some vocal misdemeanour, is a very graphic portrait; nor are his mental characteristics less well delineated. His love of money, love of ease, love of good eating and drinking, and passion for diplomacy, his good-nature, his tyranny, his truly Teutonic sentimentality, and all his various little pretences, are brought out capitally; while Madame Droigel, "extracted from a depth of insufficiency which no pure German could hope to fathom or understand," and the beautiful, shrewd, kindly, yet worldly-minded Gretchen, who manages at last so to establish herself in life that she is able to carry out the desire of her heart and do nothing for the remainder of her days, are equally good in their way. The Professor's reasons for preferring England to his "win country" are potent and clearly expressed; and found to be all-powerful by personages of many nationalities:—

"Mine own child," said the Professor, "when the frosty weather nips you up to the neck!"—and he convulsed his mighty frame with a stage shudder—"which do you love best, a full grate or an empty? When you are hungry—but hunger I suppose is a sensation unknown to Annie, who nibbles, nibbles, unlike Droigel, who eats plates upheaped—but put it that you felt hunger, should you not prefer a larder well garnished to one empty, and sweet clean? The royal sultan, the substantial side of bacon, the appetizing sausage, and the useful loaf would recommend their presence. Good; so far you follow me. This England of yours, cursed in its climate and—well, in nothing else, we will say—blessed in its soil and its wealth and its position, its blazing coals, its bread and meat to me. I find not here ethereal blessings—I find no appreciative public, no wreaths, no garlands, no medals; but in lieu thereof the cakes and ale which in my own land of poetry and romance might well be forgotten."

"Setting aside the fact of its being poisonous, a man cannot live on laurel. He needs the fat bees, he delights in the fine wheaten bread with which London can supply him. It is true, and pity it is, that as regards art, the English are outer barbarians; but what matter? They know how to live, they know how to let live. There, Annie, much beloved, is the case in a nutshell, as your adage has it."

So Droigel abjures Vaterland, and contrives even to baffle the British tradesmen whom his soul abhors, to whom he gives no promises "but that which their souls love not, cash"—since, as he wisely says, "across the counter is the antidote for cheating." His management of the gardener who, prevented from stealing his vegetables, complains to the landlord of his eccentric but not dishonest tenant, is very amusing; indeed the Herr, whether in his public or private capacity, is seldom at fault. We wish we could say as much for the heroine. Never were such tame love affairs before introduced into a novel. Indeed, we should never have known that Annie was in love but that she suddenly informs us that during her first appearance on the stage, when one would have thought that she would have been wholly occupied with her success, her heart at last understood its own mystery. This must be taken to mean that she had been unconsciously in love with Sylvester Birwood, the destined husband of Miss Cleves, who it seems had also long been attached to Annie, and desired to prevent her from becoming an actress. It is needless to say that she eventually marries him. There is another love episode, short and uninteresting; Annie is wooed by an Honourable Mr. Florence, a man of the vulgar, fast type, described as "handsome, with dark hair, a high forehead inclined to premature baldness" (we did not know that the forehead was usually covered with hair), "well-cut aristocratic features, a firm, hard, cruel mouth, and eyes that never softened or changed." As Annie feared him more than a tiger or

a leopard, although he does not seem to be a very ferocious personage, she naturally does not encourage his intentions, and indeed goes the length of running down a cliff into the sea, than remain in his company. As she has to limp home, her boots sudden and torn, with her wet skirts clinging round her, and her bonnet a mass of straw pulp, she is rather afraid she may have done something unfeminine, although she probably believes she is acting with that firmness which she had a short time before discovered to be a necessary element in goodness—a fact of which she says that "threescore years and ten oftentimes find men and women ignorant."

Mrs. Riddell is, as we have stated more than once, very superior to the ordinary novelist who spins out so many random pages for a certain stated remuneration; but she has much to learn ere she can be ranked with the masters of the art of fiction; although we are far from saying that she may not yet attain to a considerable likeness to them if she but possesses courage and perseverance to go through the necessary amount of study.

NOTICE.

We beg leave to state that we decline to return rejected Communications; and to this rule we can make no exception.

The SATURDAY REVIEW is duly registered for transmission abroad.

Nearly all the back Numbers of the SATURDAY REVIEW may be obtained through any Bookseller, or of the Publisher, at the Office, 38 Southampton Street, Strand, W.C., to whom all Communications relating to Advertisements should likewise be addressed.

The publication of the SATURDAY REVIEW takes place on Saturday Mornings, in time for the early trains, and copies may be obtained in the Country, through any Newsagent, on the day of publication.

Now ready, VOLUME XXXV., bound in cloth, price 10s. Cloth Cases for Binding all the Volumes, price 2s. each. Also, Reading Cases, price 2s. 6d. each. May be had at the Office, or through any Bookseller.

Copies of the SATURDAY REVIEW Bill of Contents will be forwarded every Friday Evening by post, prepaid, to any Newsagent in Town or Country on application to the Publisher.

THE POPE AND THE EMPEROR.

IN the early part of last August the POPE took it into his head to write a letter to the German EMPEROR on the subject of the recent measures directed in Prussia, and in a less degree in Germany, against the Romish priests. It was a letter eminently characteristic, the real honest overflow of the inmost feelings of the aged and venerable writer. The POPE, credulous and enthusiastic, blinded by the prejudices of a clique, full of love and of spite, of blessing and of cursing, shows in every line of it. The POPE has heard a thing, and chooses to think it is true; therefore to him it is true, as true as that the sun shines in a clear sky at midday. He has been informed that the EMPEROR is a poor deluded creature, led on by dark spirits to do things of which he is ashamed and repents. This unfortunate vacillating heretic has got into bad hands, and the POPE's heart bleeds for him; and urges him to gather together as much courage as he can, and change his course while it may yet be time. And then this EMPEROR who is now so bad was once so good, and used to write to the POPE such beautiful letters, and do everything she was bid. Even if there were not these affectionate memories to stir his mind, the POPE would still let the EMPEROR know the real state of things, and give him good counsel; for the EMPEROR WILLIAM has been baptized, and so belongs "in some way or other, which to define more precisely would "be out of place," to the POPE; and it must be owned that most baptized people who do not comply with the POPE's wishes have been so far recognized as belonging to him that they have never failed to learn from him how damnably he thinks they behave. But in addressing the Protestant EMPEROR the POPE condescends to take somewhat lower ground than satisfies him when he is addressing an erring sheep like VICTOR EMMANUEL. It is no use whitening the lily or damning a heretic. But a heretic is open to fears of temporal penalties, and so the POPE asks whether the EMPEROR is not sharp enough to see that, by permitting the wicked measures of his Government to be carried out, he is really undermining his own throne, and causing his new fine Empire to crumble to pieces. If anything could frighten the EMPEROR, this stroke of clerical art might be relied on to do it. What makes the POPE's letter interesting is that he so evidently thought it a matchless piece of composition. The letter had got everything in it that it could have. The grounds on which it was written were shown: the good behaviour of the EMPEROR in old days, and the duty of the POPE to preach the truth to one belonging to him in an indefinable manner by baptism; the heinous nature of the offence, allowing measures to be taken against the religion of Jesus CHRIST; the mode in which the EMPEROR had fallen, by becoming the silly tool of bad men; and the sad consequences, the undermining of his throne—all were put perfectly clearly; and then the letter ends with kind, gentle words of love. Surely the EMPEROR who could read unmoved such a perfect model of ecclesiastical letter-writing must have a heart as hard as the nether millstone.

The EMPEROR's reply bears date in September, so that time was taken to answer the POPE's letter; enough time, it may be suspected, for one of those bad men at whose influence the POPE hinted to have had something to do with the framing of the answer. But if PRINCE BISMARCK helped his Royal Master with the matter of the letter sent from Berlin, he was far too wise to interfere with the manner. It is written in the peculiar vein of thought due to the EMPEROR WILLIAM. It takes quite as high ground as

that taken by the POPE, and the EMPEROR lets the POPE know that he too has a mission, that of keeping the peace and upholding the laws in the States entrusted to his care. As to the special contents of the POPE's letter, all that the EMPEROR cares to say is that, whereas the POPE avowedly wrote to him on information the POPE had received, this information was entirely wrong. His Holiness is entreated to observe that he is writing about matters of which he knows nothing whatever. The POPE has been told, and in his easy credulity believed, that the EMPEROR did not approve of the measures of his Government. The fact is that the EMPEROR entirely approves of them. The POPE has been so ill-guided as to believe that the cause of religion and of truth is at stake, whereas all that the EMPEROR and his Government had been doing is to protect his country against intrigues with which neither religion nor truth has anything to do. The POPE chooses to assume that it is the EMPEROR and his Government who are irreligious; whereas, on the contrary, it is the Catholic priests who are transgressing a clear Christian duty and rebelling against those who are set over them. So much for the POPE's information; and as for his belief that the EMPEROR in some subtle way belongs to him, the EMPEROR can only set against this his belief that he does not belong to the POPE at all. The EMPEROR's letter is a very good letter in its way, and there is in it something personal and peculiar to the writer, which saves it from being a mere exposition of one mode of regarding an important political question. But just as it is impossible that the POPE's letter should make any impression whatever on any one who does not recognize the Papal pretensions, so is it impossible that the EMPEROR's letter should make any impression on any one who does heartily recognize them. The POPE says that he is commissioned to put the Church above the State, and the EMPEROR replies that he is commissioned to keep the State above the Church. Those who think the POPE is right will like the POPE's letter; and those who think the EMPEROR is right will like the EMPEROR's letter; but no party of either side will be in any way affected by the letter which the chief of the other side has written.

These letters are not, however, wholly destitute of political importance. The POPE's letter shows that those who inform the POPE have constantly in their minds the connexion between the clerical agitation in Germany and the undermining of the throne of the KING and EMPEROR. The reply from BERLIN can scarcely fail to put an end to the rumour which has often been current, that the KING of PRUSSIA did not more than half like the violent measures into which PRINCE BISMARCK was drawing him. It will also have the effect of putting to Prussian subjects the alternative between loyalty and disloyalty; and in all issues such as that now raised sentiment decides so many minds, that the KING's appeal to the loyalty of his subjects will not perhaps be unproductive of results. At any rate the vigour with which the Prussian Government is carrying out its constitutional policy has been in no way mitigated since the POPE's letter was received. The episcopal authorities who appoint incumbents in contravention of the new laws are fined; the incumbents illegally appointed are forcibly prevented from officiating. Educational establishments not furnishing the information or declining the inspection which the Government is authorized by law to require are closed. It may be observed that the measures of the Government against the priests are of two different characters. Up to a certain point the Government is dealing with the Romish Church

as with an Established Church. It gives money to bishops, and tells them that they shall lose this money, or pay money to the State, if they appoint dangerous persons to be incumbents. It gives money to incumbents, and tells them that they shall not begin to receive this money without the Government being satisfied that they are not dangerous. The incumbent is also a State official, so far as giving baptismal and marriage certificates for civil purposes is concerned, and the State says that he shall not act as one of its officials unless he shows that he is a loyal subject. So far the State gives a temporal position on its own conditions, and every Established Church which quarrels with the State can be attacked in this way simply because it is an Established Church. But when the State, as now in Prussia, prevents all foreign priests from having the cure of souls, breaks up institutions belonging to the Jesuits and other bodies which it thinks dangerous, and insists that all priests officiating in Prussia shall have received a lay as well as a theological education, it is not fixing its own conditions for the enjoyment of temporal benefits—it is endeavouring to prevent the propagation of a set of opinions the effects of which it considers dangerous to itself. The set of opinions to suppress which the Prussian Government aims are really those embodied in the Syllabus, and the Pope naturally considers the contents of the Syllabus and the religion of Jesus Christ to be exactly the same thing. For those who reject the Syllabus altogether, or who hold its theories vaguely in solution with the contradictory theory that their own temporal Government must be upheld against all Powers whatever, the question is not whether the State may not take extreme precautions to avoid extreme dangers, but what is the real amount of danger at any given moment. If the Clerical and Legitimist party miss the great prize in France for which they have been so fiercely striving, the Prussian Government may discover that there is no immediate reason for exacting a very strict compliance with the new ecclesiastical laws; and when HENRY V. is comfortably established for life as the Count of CHAMBORE, the Emperor WILLIAM may some day, if their lives are prolonged, once more write to the Pope letters like those with which in former days the Pope was so much pleased.

SPAIN.

THE prospects of the Spanish Government seem on the whole to be improving. It is difficult or impossible to ascertain the actual results of the engagements which occur from time to time between the Government forces and the Carlists or the Carthagena rebels; but it is something that there is a regular army in the field, and that the insurgents have at least no longer the undisputed command of the sea. For the moment, indeed, the blockade of Carthagena has been raised by the extraordinary conduct of Admiral LORO, who, after once defeating the insurgents, suddenly fled without firing a shot when a second engagement was impending. The Government has shown, however, that it does not approve his pusillanimous retreat by instantly recalling him and by despatching the MINISTER of MARINE to take command of the fleet and renew the conflict. The bungling sea-fight in which Admiral LORO obtained a temporary advantage ought to convince the Ministers and their supporters that their complaints of the conduct of the English Government are unfounded. But for a breach of neutrality in the seizure and subsequent transfer of the *Vittoria* and *Almansa*, the insurgents would have possessed uncontested superiority at sea; nor is it certain that in that case the whole course of the civil war might not have been altered. It would be difficult to defend the conduct of the English Government, except on the ground that it was dictated by entire good faith. The insurgents would have a perfect right to object to interference if only they had secured a position which gave them an opportunity of remonstrating. Even with the aid of the two ironclad vessels which have been restored, the Madrid fleet would scarcely be a match for the insurgents if they had the good fortune to possess disciplined crews or capable commanders. Few stranger episodes have occurred in history than the maritime tournaments which are now celebrated at Carthagena in the presence of critical spectators belonging to three or four neutral nations. During an exchange of broadsides which seems to have been less awkwardly managed than the rest of the operations, the crew of an English ship paid both parties the compliment of a round of cheers. The conflict was

happily almost bloodless; and it may be hoped that in a short time a purposeless and ridiculous war may terminate in submission and amnesty. With commendable inconsistency, the insurgents who undertook to establish anarchy have maintained a kind of order in Carthagena; and it is said that even the convicts who were released and armed have discontinued their habits of rapine and murder. There is no apparent pretext for further resistance; but it is impossible to understand the motives of Spanish soldiers or politicians. If the Carthagena fleet should obtain a victory, it may perhaps be thought worth while to continue the rebellion for the purpose of levying contributions on the neighbouring maritime towns. Neither party seems for the present disposed to attempt serious operations by land.

In the late battle between ORO and MORIONES, it would seem that the Carlists remained in possession of the field; but on the following day they were compelled by want of ammunition to retreat to Estella. In the present state of the contest an indecisive battle is probably more disadvantageous to the Royalists than to the Republicans. The inhabitants of the Carlist provinces are reasonably discontented with the policy or strategy of the generals who make their country the permanent seat of war; and it is becoming evident that in other parts of Spain the cause of Legitimacy is hopeless. In a short time the Ministry at Madrid will derive from their new levies the means of reinforcing their armies in the North; and the despondency which had been produced by a rapid succession of disasters is checked by a growing confidence in the ability and fortune of CASTELAR. Even the prolonged resistance of Carthagena has proved the weakness of the cautious insurrection, since no other town or district has created a diversion by proclaiming its own separate independence. The inaction of the besieging army is perhaps caused by an expectation that the rebels may submit when they despair of ultimate success. The contest in the meantime proceeds in a singularly amicable spirit, and the Republican General addresses his rebel opponent in the most affectionate and deferential language. It is perfectly natural that in a country which has long been ruled by adventurers, and distracted with unprincipled factions, the sense of moral indignation which depends on political principle should give way to polite impartiality. The rebels of Carthagena are only illustrating by exaggeration the doctrines which were long consistently maintained by the members of the present Government. When it is admitted that obedience to constituted authority depends on agreement with the political opinions of the Government, no rebellion can be regarded as culpable, except when it involves a miscalculation of forces.

The leaders of the Conservative party who have returned to Madrid concur in the expediency of supporting the present Government; and although during the convenient suspension of the sittings of the Cortes it is not easy to understand how they can influence the course of public affairs, the absence of political opposition, and of the plots into which it ordinarily degenerates in Spain, will relieve CASTELAR from anxiety and perhaps from danger. If SERRANO still retains any portion of his former influence with the army, he may perhaps render effective aid in the suppression of the different rebellions, although he is not himself prepared to accept any military command. He is on sufficiently confidential terms with CASTELAR to have advised him to appoint one of the two Generals CONCHA as Captain-General in Cuba, and the other as Commander-in-Chief in the North; but the choice of the Government cannot be determined by exclusively professional considerations. The leader of a victorious army necessarily exercises political power in Spain; and none of SERRANO's friends and former comrades have heretofore approved of the Republic, except as a provisional arrangement. At a late meeting of the chiefs of the Conservative party there was a unanimous feeling that the present Ministers ought to be assisted in their efforts to suppress anarchy and civil war, but a wide difference of opinion prevailed as to the expediency of accepting the Republic. Admiral TOSTES indeed declared in favour of a Unitarian Republic, for the singular reason that there was no other security against the triumph of the partisans of DON ALFONSO, although they have of late not even ventured to announce their pretensions. It is strange that an honest politician who has hitherto been a consistent advocate of Monarchy should entertain an insuperable objection to the accession of the only possible candidate for the throne. The errors of Queen ISABELLA can scarcely be held to be fatal to the claims of her son; and

the Duke of MONTPENSIER, who was formerly preferred by Admiral TORETE, no longer advances pretensions which would in any case be inadmissible. After the treatment which King AMADEO received from the nation which had invited him to ascend the throne, no foreign prince will be ambitious of a thankless and dangerous promotion. The Republic has at present no active opponents except among the jarring Republican factions; but if royalty is at any time restored, Don ALFONSO has the best chance of succeeding.

An overture of alliance made by Señor MARTOS on behalf of the old Radical or Progressist party has been courteously declined by the Conservatives, who for the most part belonged to the former Liberal Union. In the rapid changes of Spanish politics, distinctions of party have often been effaced, or even reversed; and the so-called Radicals were driven out of the first Republican Cabinet as reactionary supporters of the Monarchy. ZORRILLA, who in office and in opposition was the acknowledged leader of the Radicals, maintains almost alone complete abstinence from public affairs. There appears to be no sufficient reason for the refusal of SAGASTA or SERRANO to co-operate with ZORRILLA's political friends; and perhaps the postponement of a closer connexion may be explained by a prudent fear of embarrassing the present Government. The only Republic to which either Conservatives or Radicals could offer their adhesion would be founded on the assumption of the absolute unity of Spain. CASTELAR, though he is actively engaged in counteracting the tendency of the provinces to secede, is encumbered by his former professions of Federalist doctrines. It would be highly impolitic to force him either to repudiate or to reassert principles which he is willing from patriotic motives practically to disavow. If Federalism only means administrative decentralization, there is no reason why it should be more attainable under a Republic than under a Monarchy. Like all other theories which have become the watchword of political factions, the phrase had acquired in Spain a secondary or accidental interpretation. The Federal Republicanism of CASTELAR was probably a vague expression signifying extreme democracy; and the anarchists through the country understood that under a Federal system they were themselves to exercise absolute power over the persons and property of their neighbours. The Unitarian Republic which approves itself to the judgment of TORETE and other Conservative politicians is more moderate and more reasonable than any imaginary Federation, but it has the disadvantage of not commanding the genuine support of any section of the community. The Progressists and Radicals only accept the Republic in any form as a compromise; and the Republicans, until they derived instruction from recent experience, were almost universally pledged to the Federal doctrine. It is nevertheless possible that all parties may for a time agree on a form of Government which none of them really prefer. The result may perhaps be affected by the course of events in France. The maintenance of the Republic in that country has become more probable, in consequence of the precipitancy of the Legitimists, of the abdication of the ORLEANS Princes, and of the obstinacy of the Count of CHAMBORD. The influence of French example has always been great in Spain.

THE TAUNTON CONTEST.

THE success of the SOLICITOR-GENERAL at Taunton must be very gratifying to the Government, and is very encouraging to the Liberal party. Most moderate and impartial men, too, will be glad that a law officer who was clearly entitled to promotion, who had not intrigued for his office or purchased it by subserviency, who conducted himself in a sharp electoral contest with courage and good sense, and who was subjected to some amount of not over-scrupulous opposition, has carried the day. How it happened that he not only won, but won by a majority of 87, is not to be explained, except by those possessing a very intricate knowledge of the local politics of Taunton. The SOLICITOR-GENERAL polled nine votes, and nine votes only, more than he polled in 1868, which shows that the Liberal party kept well together and did its best for him, but not that it had received any great accession of strength. What gave him on Monday so considerable a majority was that the Conservative candidate received much fewer votes than his predecessor received in 1868. Then Serjeant Cox polled 918, and now Sir ALFRED SLADE has only polled 822. The votes given to Serjeant Cox were reduced on a scrutiny to

889; and as the object of a scrutiny is attained if either party has a bare majority, there may have been more votes that could have been struck off, and it is not, therefore, quite certain that 889 Conservatives with unassailable votes polled in 1868; but at any rate a much larger number of such voters supported their candidate five years ago than have supported his successor now. The cheering news of the Liberal victory at Bath, and the stimulating effects of Mr. DISRAELI's letter, may have given strength, spirit, and coherence to the Liberal force, but they can hardly have made any large number of Conservatives abstain from voting. The election was, in short, won by Conservative inaction, and Liberals who have been going through so long a period of Liberal inaction must be delighted to think that at last their opponents are suffering from the same malady. It is perfectly futile to attempt to invent any reasons to account for this amount of Conservative inaction in a small Somersetshire town. The Conservatives may not have thought much of their candidate, who generally employed a gentleman to talk for him, and got into wild language when he tried to speak for himself. They may not have relished the facility with which he seemed inclined to fall in with any crutches which might gain him a few votes. They may possibly have had some scruples about interfering with the re-election of an honourable opponent whose career has been in every way a credit to the borough he represents. But these are all guesses, and all we know is that the Conservatives did not poll nearly so many votes as they did five years ago, and that the SOLICITOR-GENERAL has been elected. His re-election by a decisive majority, the Liberal victory at Bath, and Mr. DISRAELI's letter have in a very considerable degree changed the position of the Government. It will be satisfactory to them if they can retain the Liberal seat at Hull, but it will not much damage them if they cannot. They have gained breathing-time and peace, and have now a fair opportunity of trying whether, in a fresh Session, they can do anything to revive their reputation, and show that painful experience has taught them to avoid gross blunders.

Sir ALFRED SLADE was much disappointed at the result, and very naturally, for he had received promises from one hundred and fifty persons who did not vote for him. What pained him particularly was that he could not, under the Ballot, know who were the voters who kept their promises and who were the voters who broke them. All he could do was to leave the memory of the election to the consciences of all his nominal supporters—to the happy consciences of those who had been faithful, and to the remorseful consciences of those who had been treacherous. How far the consciences of those who under the Ballot make promises and break them are likely to be remorseful, is a curious question of some practical interest. It is obvious that in a small constituency where every one is known, and where influence of all kinds can be brought to bear without any infraction of the law, the thought must come into many minds that to promise a vote is much the easiest way of escaping solicitation. The voter can promise not one side only but both, and so make friends of the Mammon of unrighteousness all round, and yet remain as free as air, and able to express his principles or gratify his caprices at the polling-booth without the slightest regard to the promises he has made. It was, indeed, one favourite argument with the ardent supporters of the Ballot while the measure was under discussion that coercion would be found useless; because, although those who were under subjection were sure to promise to vote as they were asked, no one would believe that they would keep their word simply because they had given it; and if every one open to coercion kept his promise, it is difficult to see how the Ballot would interfere with coercion at all. The same may be said as to the system introduced by the Conservatives, which consists in requesting all Conservative voters who have voted for the party candidate to give up a card to the agents of the party. This giving up a card amounts to an assertion that the voter has voted in a particular way; and if the system could be rigidly carried out, if voters who had promised to vote for the Conservatives were subjected to annoyance if they did not give up their card, and only gave it up when, in point of fact, they had voted as they promised to vote, the whole scheme of the Ballot would be made nugatory; or, if it fulfilled its aim, the voter would be gently led on to a double deception, in order that he might avail himself of his legal rights. He would first promise without performing, and then assert

that he had kept his promise when he had not. Fortunately there is as yet no reason to suppose that the Conservative agents have made the device of requesting cards to be given up an instrument of any kind of oppression; but it is obvious that it might easily become so, and as it seems to fail as a means of learning from time to time the state of the poll, it will be satisfactory to hear that it is likely to be abandoned before long. The broken promises given at Taunton were probably due to nothing that can be called coercion. They were rather the fruits of too ready a wish to please. If, however, canvassing only results in obtaining promises which are not meant to be kept, and are only on a level with the polite assurances of a Spanish host that his house and everything in it are at your disposal, canvassing, it may be thought, can be of no use, and will soon be looked on as a very troublesome and antiquated usage. This would be a very pleasant result for candidates, but in real life there is no chance of it. Every constituency wishes to be canvassed according to the system of canvassing that is possible in it; and in boroughs small enough to make personal canvassing possible, a candidate must undertake it and work very hard at it if he wishes to succeed. Those who are indifferent cease to be indifferent if only one of the two gentlemen who wish to get into Parliament comes to see them, and those who believe themselves to have some political prepossessions think that there is something due on both sides, and that if they vote for their man, he at least ought to take the trouble to come to see them. But it certainly adds to the pains and terrors of canvassing to know that now the utmost success it can produce may be illusory, and that the civil voter who seems to yield so pleasantly to reason or blandishment may be thinking how secretly and safely he can follow his own fancy on the day of election.

The Taunton election also suggests another operation of the Ballot. Mr. JAMES showed the utmost resolution in refusing to ally himself with any of the small cliques that attempt to make an election turn on the adoption by candidates of some trumpery crotchet which these cliques are pleased to consider all important. More especially he stood firmly aloof from the lady agitators in favour of female suffrage. The Conservatives were not so high-minded, but even they were obliged to draw the line. Their candidate permitted these ladies to hope that his vote in Parliament would be on their side; but when they asked to be allowed to stand by his side and address a Conservative mob, their modest request was refused. Wives are recognized as entitled to do all they can for their husbands, and the persevering efforts of Mrs. BARNETT and Mrs. HATTEY extorted general admiration at Dover and Bath; but when a man is asked to stand on a balcony in company with a "social failure" who is an entire stranger to him, the sense of the ridiculous overpowers him. The publicans, too, of Taunton, or at least a large number of them, held a meeting to decide whether the interests of beer ought not to prevail over every other consideration, and a slender majority decided that the whole vote of the trade should be given to the Conservative candidate. The minority protested, and it is obvious that under the Ballot a protesting minority can vote exactly as they please. The Ballot may, in fact, do much to interfere with the success of candidates who sell themselves to cliques, and much to aid the success of candidates who resist them. A great many voters heartily dislike and resent the dictation which these cliques attempt to exercise, and may easily come to the conclusion that they will punish the candidate who yields to this dictation, although he is the candidate of their own party. They will not openly separate from their party, for that would cause them much annoyance, and subject them to many reproaches. But when the day of election comes they will vote against their own side. It is quite conceivable that, in such a place as Dewsbury, Liberals who found their representative coquetting with a faction that seeks to break up the Empire might say very little against him, but, when the day of election came, might help to bring in his opponent. This consideration no doubt brings a candidate to look at elections from a low point of view, and there is nothing grand or admirable in the conduct of electors who affect to support their party, and yet secretly vote against it. But candidates who are ready to buy the support of cliques start with a willingness to look at elections from a low point of view. The only way of instilling into them sufficient firmness to resist the dictation of cliques is to induce them to believe that they will be making a bad bargain if they yield; and one of the most

valuable results of the Taunton election will be to make timid time-serving candidates suspect that such a bargain may probably be a very bad one.

THE FRENCH ELECTIONS.

A GENERAL election could hardly have been more significant of the feeling of the French people towards the Fusion than the four elections which were held last Sunday. The Republican victories have not been won in the great cities which cherish a fanatical hatred to Monarchy. The field of battle has been those rural districts which French Conservatism has especially made its own. Nor were the defeated candidates men of strong Monarchical professions. On the contrary, they carefully avoided all reference to the Fusion in their addresses, and presented themselves simply as friends of peace and order. A year ago they might have been ranked among Conservative Republicans, and in that character would very probably have been returned. If there had been any sneaking kindness for Monarchy in the hearts of the electors, they might easily have voted for them without avowing any desire for a Restoration. But so far were they from feeling anything of the kind, that even the suspicion of being a Royalist was enough to discredit a candidate in their opinion. All they asked in their representative was that he should be a Republican. If he were a moderate Republican, Radical Republicans voted for him as enthusiastically as though he had been a man of their own way of thinking. If he were a Radical Republican, moderate Republicans were equally ready to give him their support. The differences which separate the two sections of the party—differences at other times so vital and far-reaching—have for the time disappeared. There is a matter on which they are agreed, and which, as long as it is unsettled, reduces their differences to nothing. To this united Republican party has been joined a vast concourse of allies who till now scarcely knew that they were Republicans. They were Conservatives and nothing more, and if the Fusion had never been effected, they would have remained Conservatives and nothing more. Indeed, it is their very Conservatism that has suddenly made them Republicans. They find the name appropriated by a party in whose mouths Conservatism means a change backwards. The French peasant does not wish to return to some former state, he only wants to be let alone in the state in which he is. The Government which he thinks will best ensure him this is the Government which he is determined to support. It was the great triumph of M. THIERS that he was able, during the two years he was in power, to present the Republic in this light. It is now proposed to substitute for this Republic a Monarchy with which the peasant has no associations but such as to him are worse than any number of revolutions. The Count of CHAMBORD may be misunderstood and misrepresented; though, if so, he is misunderstood and misrepresented by those who claim to know him best. But where the chances of a Restoration are concerned, the important point is not what he is, but what he is thought to be; and, judged by this standard, his name is the symbol of political and ecclesiastical reaction. The *Journal de Paris*, the leading Orleanist organ, frankly admits this. A great part of the electorate, it says, is persuaded that the restoration of the Monarchy would be equivalent to a restoration of ecclesiastical supremacy, and against the political domination of the clergy the French peasant cherishes a hatred which has become hereditary. Upon this point he will listen to no arguments. You may lead him where you will in any other direction; but in this direction, or in what he suspects to be this direction, he will not move an inch. The Duke of BROGLIE has said that a clerical restoration is impossible; the Count of CHAMBORD has said that he does not desire such a restoration. But the peasant is obstinate; his suspicions have not been shaken, and the elections of Sunday last are his answer to the Royalist summons.

This account of the matter is beyond all question the true one. The moral which the *Journal de Paris* draws from it is, that it is no good waiting till these prejudices are removed. The Monarchy must be restored, and then, when the peasants see that this restoration is not attended by the consequences they dread, they will by degrees come to regard it with more favour. Those Frenchmen who are first Royalists and then Conservatives will think this the most natural order of proceeding. Those who are before all things Conservative will be inclined to ask themselves what good is to follow from thus running counter to the

wishes of the great mass of the nation. In what respect, they will say, can the Government of the King be better able to maintain order than the Government of the Republic? It will not unite the Conservatives more closely among themselves, for the late elections have made it clear that some of the most Conservative elements in the nation are heartily opposed to it. It cannot hope to put down insurrection more decidedly, for the most formidable insurrection which ever confronted a French Government was put down by the Republic. Granting that the notions of the peasantry about the Count of CHAMBORD and his relations with the Church have no foundation in fact, why should we risk our fortunes in the keeping of a ruler about whom such notions are commonly entertained? Granting, again, that the Radicals are as dangerous as the Royalists make them out to be, the Republic is better able to control them than a King will be. If France once more becomes a legitimate and hereditary Monarchy, the Radicals will secure a great deal of sympathy, and even of co-operation, which, if they had been conspiring against a President instead of against a King, would have been entirely withheld from them. A throne will add no real strength to French Conservatism; it will be merely an additional position to be defended. All this would be true if the Count of CHAMBORD's repudiation of clerical sympathies could be accepted as satisfactory. But is there any reason why it should be thus accepted? It may be admitted to be sincere, as far as it goes; but then to ascertain its meaning it must be read in common with his own former declaration and with the language of his most consistent supporters. The *Journal de Paris* confesses that the impolitic language of certain religious newspapers is a weapon in the hands of their adversaries; but what ground is there for believing that the language of those newspapers does not represent the Count's views more accurately than the language of the more secular journals which support his cause? How should men who have all their lives been partisans of a rebel dynasty, and whose repentance is not yet three months old, presume to be more intimate with HENRY V. than the men who have been Legitimists from the moment they were old enough to take any part in politics? Ecclesiastical reaction is a question of degree. The most ignorant peasant does not suppose that the Count of CHAMBORD will set up the Inquisition, and the *Univers* itself has graciously announced that the Eldest Son of the Church will not compel his subjects to go to mass. But the *Univers* would not be so ardently Royalist if it did not believe that the Church would profit by the Count of CHAMBORD's return; and the French peasant has no mind that the clergy should have any more power than they have now.

The Ministry have in some measure themselves to thank for the importance which will be attached to the recent contests. They allowed it to be understood that one main reason why the Right was resolved to drive M. THIERS from power was, that it distrusted his management of the elections. Their theory was that Frenchmen usually vote as the Government for the time being wishes them to vote, and they complained that M. THIERS, instead of turning this disposition to good account, allowed the electors to think that anybody who called himself a Republican was a friend to the Republican Government. It cannot be pleaded that the present Administration has erred in this way. The Duke of BROGLIE has again and again declared that he will use every legal means to put down Radicalism, and the MINISTER of the INTERIOR showed by his famous Circular to the Prefects what a liberal interpretation he was prepared to put upon the term legal means. The Right has been completely beaten upon a ground which it had itself chosen. It assumed the control of the elections on the plea that, if they were properly conducted, the real feeling of the country would be unmistakably manifested, and would be found to be in complete harmony with that of the majority in the Assembly. The real feeling of the country has been unmistakably manifested, but before it can be described as in harmony with that of the majority in the Assembly, the work of the 24th of May must be undone, and the majority must again become Republican. The Government has committed another blunder in not filling up all the vacant seats at the same time. If fourteen elections, instead of four, had been held last Sunday, the impression made on the country would not have been much more marked, while the process of forgetting it might have begun at once. As it is, another election must be held this very month, and two or three more in the course of November. In this way public excitement will be

kept up by the spectacle of one Republican victory after another, and wavering deputies will have full time to reflect upon their chances of re-election if they go against the wishes of their constituents in the decisive division. The prospect that they will be consoled, if they do so, by finding themselves in the majority grows steadily less. M. ROUVIER's letter is conclusive as to the action of the Bonapartists in the Assembly. The Imperialists have as little to hope from a general election as the partisans of the Count of CHAMBORD, but what chances they have depend upon the Republic being allowed sufficient rope to hang itself. It is quite certain that the Government which follows the Government of HENRY V. will be Republican, and in this way the possibility of any realization of Bonapartist hopes would be indefinitely postponed. The belief that the Republic cannot succeed in keeping the Radicals under control leads them to the same practical conclusion as the belief of the Left Centre that the Republic can alone succeed in keeping the Radicals under control. In a Parliamentary struggle votes count more than motives; and though the Bonapartists will again be enemies of the Republic the moment the Republic is secured against a Royalist Restoration, they may be useful auxiliaries in the interval.

INTERNATIONAL JURISTS.

MR. DUDLEY FIELD, as appeared from his address to the Social Science Association at Norwich, agreed seven years ago with other ambitious jurists to produce by their combined efforts a code of international law, including provisions for arbitration. His partners in the undertaking either directed their energies into other channels, or satisfied themselves by reflection, and perhaps by experiment, that the enterprise was intrinsically impracticable. The old want of a fulcrum from which the material universe was to be moved reappears with every attempt to escape from the actual conditions of life. The problem proposed to themselves by international legislators is to obtain from independent nations the same obedience which would be rendered to authority by the subjects of a single Government. It is not impossible to construct a code of moral obligation, and to assume that it has obtained some kind of legal sanction; but, even if Mr. DUDLEY FIELD could persuade all civilized States to acquiesce in his proposed enactments, the executive force which is essential to the very existence of law cannot be provided except by the abolition of independence. It has often been remarked that the notion of international law was originally rendered credible by the practice of the Holy Roman Empire, where potentates, in other respects practically independent, were to a certain extent subject to coercive jurisdiction. In the feudal kingdoms of the middle ages, the superior lord exercised, when he was strong enough, a similar control over powerful vassals; and the Popes, when they were at the height of their power, claimed a kind of censorial authority, which was enforced sometimes by means of spiritual censures, and more often by the arm of secular allies. The early writers on international law scarcely attempt to distinguish between moral duty and legal obligation. Courts of Admiralty have applied rules which had previously obtained more or less general acceptance to persons and property within their own municipal jurisdiction; and between particular States a kind of statutory law has in some cases been established by treaties. It is desirable that public law, as far as it has been defined, should be generally respected; but the whole fabric is founded on voluntary and continuous contract.

It is of course impossible to judge of the merits of Mr. FIELD's code from his general explanation of his purpose, or even from his summary of its contents. His plan appears to be comprehensive, and it may possibly be exhaustive; nor can it be doubted that an elaborate treatise on private and public rights which may be connected with international law is likely to be useful. Questions of domicile, of allegiance, of disposition by will, of maritime collision, and many other subjects or incidents of litigation, involve much uncertainty and complication. In the great majority of cases which occur in time of peace the municipal court determines without dispute the extent of its own jurisdiction. When the rights of sovereigns are involved, the question is sometimes discussed between the respective Governments; but nothing is rarer than a national dispute arising from the ordinary proceedings of courts of law. The occasional seizure of foreign smuggling vessels on the high seas

approaches, as an exercise of force, more nearly to one of the acts which constantly cause misunderstanding between belligerents and neutrals; but in all the wide range which Mr. DUDLEY FIELD appears to have traversed in his recent labours, the subject-matter lies within the province rather of lawyers than of Social Science reformers. The principle that aliens are liable in common with subjects to municipal jurisdiction solves in principle a large part of the difficulties which from time to time occur, although complicated questions may arise on its application to the facts of a particular case. The ancient and barbarous custom by which the goods of foreigners dying in France were formerly liable to forfeiture, however repugnant to common sense and to national equity, could not be regarded as a violation of international law. It might perhaps be convenient that civilized States should as far as possible adopt the same rules of jurisprudence on all points in which the subjects of any Government are liable to the jurisdiction of foreign Courts; but the matter is not one of urgent necessity; and the two greatest commercial nations acknowledge by a happy accident precisely the same maxims of jurisprudence. In all that relates to private rights it is unnecessary to devise a new code for England and the United States. In both countries the doctrine of indefeasible allegiance was until lately maintained, and the differences of opinion which afterwards arose have now been settled by treaty. The courts of both countries administer the same law in all questions of property.

Other methods for promoting cosmopolitan unity or uniformity lie outside the domain of law. Identity of coinage and of money, of account, of weights and measures, and of other instruments of exchange, would produce more or less convenience to that portion of every community which either travels abroad or engages in foreign commerce. It is generally thought that the Germans have made a mistake in allowing a fractional difference of value between their principal gold coin and the English sovereign; and, on the other hand, some theorists would assimilate the English coinage to the French. The domestic transactions of every community are so greatly more numerous and more important than international dealings that no increased facility to travellers would compensate for the substitution in England of francs for shillings. Not one person in ten thousand has occasion in the course of his life to reduce cubic yards into metres; but legislators of the Social Science order have amused themselves with the harmless triumph of hanging up tables of metrical measurement on the walls of elementary schools. The most ambitious and sanguine of living advocates of uniformity is the President of the UNITED STATES who not long since anticipated in his Message to Congress the universal adoption throughout the world of the American Constitution and the English language. That national differences tend to the full and vigorous development of human faculties, and that it would scarcely be expedient to abolish the literature of France, of Italy, and of Germany, are considerations too remote for the apprehension of General GRANT, or perhaps of the Social Science Association. Mr. FIELD as a practical lawyer has reason to know that the possession of the same coinage and a common language has not been found inconsistent with the perpetration of outrageous frauds in New York or in other parts of the world. Even if his proposed Code were universally adopted, there would still be room for the devices of an international FISK or a cosmopolitan GOULD.

The only part of Mr. DUDLEY FIELD's project which can have possessed any special interest for the Social Science Association was the chimerical project of international arbitration. As an independent investigator of metaphysical problems arrives in a few steps at the puzzles which have perplexed his predecessors since the dawn of philosophy, modern philanthropists immediately stumble on the inherent impossibility of controlling force by any means except the employment of superior force. There is not, and there never was, any difficulty in settling by agreement or under arbitration a national dispute which is not regarded by either party as a sufficient cause for war. In the most turbulent parts of the middle ages territorial controversies were often composed by the award either of a feudal superior or of an arbitrator voluntarily chosen. The only difficulty is to substitute arbitration for war; and Mr. DUDLEY FIELD has, as might have been expected, contributed nothing to the discovery of an impossible solution. Although the process and the result of the Geneva Arbitration may

have thrown temporary or permanent discredit on the system, it is probable that in future cases Governments which prefer unqualified concession to resistance will again cover their abandonment of former pretensions by the form of reference to arbitration. It is much more certain that none of the great wars of recent times would have admitted of any similar mode of adjustment. The determination of the Northern States of America to re-establish the Union, of BISMARCK to expel Austria from the German Federation, of NAPOLEON III. to try the experiment of strengthening his dynasty by an attack on Prussia, contained no element on which a judicial decision could have been given, even if there had been a tribunal competent to entertain the litigation. The analogy which Mr. FIELD attempted to suggest between the quarrels of independent nations and the differences which arose among the American States before the establishment of the Union was unsound, because the relations of enemies and those of confederates are not only distinct, but antagonistic. Five-and-twenty years ago, at a Peace Congress held in Paris, M. VICTOR HUGO quoted an equally irrelevant precedent for the proposed settlement of national disputes, by contrasting the wars which were formerly waged with one another by the great feudatories of the old French Monarchy with the prevalence of a single code of laws enforced by recognized tribunals in modern France. M. HUGO probably thought that the establishment of French supremacy over Europe furnished the simplest and most natural method of removing the inconveniences which follow from national independence. Mr. FIELD, as becomes an American and a lawyer, is less extravagant in his expectations; but, like all theorists on the subject, he founds his scheme for abolishing war on the assumption that the task is already accomplished. It is difficult to understand how a rational projector can seriously insist on the necessity of general disarmament as long as no Power can be compelled to disband a single regiment. It might have been hoped that the Congress at Brussels would occupy itself with more serious and more useful investigations; and its members were evidently aware of the difficulty of providing for the execution of any rule that could be devised. At last, with an ingenuity which ought to excite the envy of the Social Science Association, they passed a resolution to the effect that arbitration ought to be made obligatory on nations. The proposition that independent Governments must obey the behests of the Brussels Congress is worthy of the most advanced professors of social science. The reconciliation of freedom with necessity would long since have been accomplished by philosophers if they had been contented to make compulsion exclusively figurative or verbal. At the dinner which closed the sittings of the Congress Dr. BLUNTSCHLI, as representing Germany, supplied an instructive commentary on the previous proceedings by reserving to his own country the right to vindicate the cause of intellectual freedom "even by the sword."

FIFTY YEARS OF THE FOREIGN OFFICE.

MR. HAMMOND, who has resigned the Under-Secretaryship for Foreign Affairs, has assisted during his fifty years' service at one of the most complete revolutions which have occurred in English and European diplomacy. Inheriting from his father, who preceded him in the same office, an experience reaching back beyond his own personal recollection, he was familiar with the almost forgotten theory of a Council of Great Powers in which his own country held a principal place. At the moment indeed when he first entered the Office a rupture had already taken place in the union which had been formed after the overthrow of NAPOLEON. CANNING, who had then recently succeeded Lord LONDONDERRY as Foreign Secretary, was distrusted by the absolute Governments of the Continent, which were principally concerned with the suppression of revolutionary and constitutional agitation. In 1823 France, under the guidance of one of the men of literary genius who have in that country often proved themselves to be political charlatans, had engaged in the task of restoring absolute Monarchy in Spain. The English Minister took every occasion of protesting against the dangerous caprice of CHATEAUBRIAND, who was the mere tool of the astute politicians assembled in Congress at Verona. At the same time, with a curious miscalculation of future probabilities, CANNING urged the American President to resist the supposed designs of the European Monarchies against the revolted colonies of Spain. It was on this suggestion, followed by

the ready assent of President MONROE, that the United States founded the so-called MONROE Doctrine of their own right to prohibit all European interference in the Western hemisphere. As the claim would have been in some other form preferred and maintained when the United States attained their present height of power, it matters little that an English Minister commenced the policy which was long afterwards conspicuously exemplified in the expulsion of the French from Mexico. When Mr. CANNING told the House of Commons that he had called the New World into existence to redress the balance of the Old, he little knew that he had only sanctioned the inevitable aggrandizement of a rival and often friendly Power. Mr. HAMMOND, who was then a young Foreign Office clerk, lived to take part in the Washington Treaty and the Geneva Arbitration.

The superintendence of European affairs by the Five Great Powers, if it was unfavourable to constitutional and democratic aspirations, secured more effectually than any previous or subsequent arrangement the peace of the world. With a few occasional interruptions the organic legislation of the Congress of Vienna was enforced and supported without resort to arms for a period of forty years. A similar, but shorter, interval of peace had in the previous century intervened between the Treaty of Utrecht and the war of the Austrian Succession. In both cases the result was partly due to exhaustion; but the fear of encountering the united opposition of Europe did much to restrain the ambition of more than one Continental Power. Popular opinion has scarcely done justice to the foresight of the statesmen who determined the distribution of territory at Vienna. It is true that they acted on the old tradition that the rights of kings and the arrangement of the balance of power were more worthy of regard than ethnological aspirations, and even than the legitimate wishes of the population; but at that time Italy was, as METTERNICH long afterwards called it when the phrase had ceased to correspond to the fact, little more than a geographical expression. The dawning consciousness of national unity in Germany was not unfittedly represented by the Federal Constitution, which formed a somewhat closer bond of union than the decayed Empire before its dissolution a few years before. The wisest and most thoughtful combination devised at Vienna was unfortunately doomed to early failure. The formation of a powerful State in the North-West of Europe had in former times been more than once unsuccessfully attempted, and the incessant disturbance of the peace of Europe during the supremacy of France sometimes caused historical students to regret the final failure of the enterprise of CHARLES of Burgundy. When the fall of NAPOLEON became imminent, many statesmen recognized the expediency of creating an independent State in the Low Countries; and the renewal of the ancient connexion between Holland and Flanders offered a natural method of effecting the object. It is probably now a cause of regret to thoughtful Belgian politicians that the free and intelligent community to which they belong is not part of a larger State. The separation of Belgium and Holland in 1830 was precipitated by the injudicious policy of the Dutch dynasty; and it has in some sense been subsequently justified by the prosperity and good government of the new kingdom; but the united Monarchy would, if it had lasted, have afforded a surer guarantee for permanent independence.

Mr. HAMMOND had the advantage of learning his duties under a succession of able masters. He was probably too young to have had any confidential intercourse with Mr. CANNING; and Lord DUDLEY only held office for a few months while Mr. HAMMOND was still a subaltern. The Duke of WELLINGTON and Lord ABERDEEN at that time were supposed to incline to the policy of the Holy Alliance, not from any preference of absolute government, but in the belief that with the outbreak of revolution the cycle of war and conquest might probably recommence. The Duke of WELLINGTON incurred the enmity of Russia by his disapproval of aggression on Turkey; but at the same time, in concert with Lord ABERDEEN, he discountenanced for a long time the establishment of an independent kingdom in Greece. Lord ABERDEEN frequently stated that his assent was finally given in the erroneous belief that the disruption of Turkey was imminent, and that it was desirable to rescue part of the dominions of the Sultan from the sovereignty of Russia. The Duke of WELLINGTON, in his apprehension of the progress of revolution, had encouraged CHARLES X. to form the POLIGNAC Ministry; but, when the folly of the King and his Minis-

ter had overthrown the Monarchy, the English Government prudently recognized the new dynasty, and even acquiesced in the separation of Belgium from Holland. The precedent of 1830 was at the time almost new, although it has since become the fixed rule that every existing Government of a foreign country shall be held to represent the nation. Mr. HAMMOND had the advantage of being young enough to accustom himself to the modern ways of thought which were then gradually superseding the former traditions of diplomacy. The domestic changes which were partly caused by the French Revolution of 1830 introduced into the Foreign Office the most active and vigorous of its modern directors. For eleven years Lord PALMERSTON managed without interruption the foreign policy of England; and, after the retirement of Lord GREY in 1834, he acted almost independently of his colleagues. During the greater part of that time he was occupied in baffling the intrigues of Louis PHILIPPE and his Ministers for the acquisition of Belgium, and for the separation of Egypt from the Turkish Empire. As Secretary of State and afterwards as Prime Minister, Lord PALMERSTON was virtually Foreign Minister for nearly a quarter of a century. At the same time he organized his department so carefully that it has since been the most efficient of the public offices; and Mr. HAMMOND, who rose under Lord PALMERSTON to the highest rank among the permanent functionaries, is entitled to a portion of the credit.

In his later years the UNDER-SECRETARY, like most official veterans, was disinclined to innovation; and the schemes of modern reformers excused the contemptuous tone of the evidence which he occasionally gave before Parliamentary Committees. In matters of detail the permanent head of a public office is practically supreme; and it was natural that Mr. HAMMOND should be held responsible for some of the disappointments and vexations which inevitably occur in the distribution of employment and promotion. His unlucky announcement of settled tranquillity when Lord GRANVILLE became Foreign Minister on the death of Lord CLARENDON ought not seriously to impair his well-earned reputation for political sagacity. The prophecy was within a few days falsified by the commencement of the greatest war of modern times; but it was wholly impossible to foresee an extravagant and causeless act of folly. If Mr. HAMMOND had at that time been in the confidence of M. OLIVIER, or even of the EMPEROR himself, he might probably have been not less confident in the maintenance of peace. A statesman is justified in assuming that Governments will consult their own obvious interests; and in the summer of 1870 the Imperial Government of France had every motive for maintaining peace. As the mistake in no degree affected the policy of England, it illustrated rather the uncertainty of human affairs than the blindness of official politicians. Mr. HAMMOND's successor will not be troubled with the anxieties which beset a former generation for the extension of English influence, or for the restoration of the lost balance of power. It seems probable that he and his superiors will rather have to deal with the unforeseen collisions of belligerent pretensions and neutral rights; and perhaps they will have occasion to reconsider the rules of international law. It may be worth while to remark that the appointment of Lord TENTERDEN involves a serious innovation, if not a constitutional anomaly. No peer has a theoretical right to decline or suspend the discharge of his Parliamentary duties; and yet it is impossible for a permanent Civil Servant to take part in the proceedings of the House of Lords. If the precedent is once established, the Ministry of the day will have a new mode of rewarding friends and buying off opponents.

THE FUSION AND THE ULTRAMONTANES.

THE most remarkable feature in the movement in favour of a Restoration in France is its relation to religion. It has all along been guided by the clergy and associated with pilgrimages and miracles. At first it seemed impossible that an agitation could derive anything but weakness from such auxiliaries. The scepticism of the national character had been regarded as established beyond the possibility of contradiction. In their dread of Radicalism Frenchmen might, it was thought, descend to any depths of political reaction, but, however intense might be their Conservatism, they would remain the disciples of VOLTAIRE. Those who thus reasoned forgot the singular vitality of the Roman Catholic Church.

Again and again she has found the secret of victory to lie in the resolution never to accept defeat. If she has sometimes suffered from her reluctance to abandon an object she has once proposed to herself, the loss has been made up to her by the habit which this training has given her of being always ready to turn unexpected opportunities to account. The Second Empire provided such an opportunity in two ways. No doubt the complicity of the clergy in the Napoleonic usurpation added intensity to the hatred felt towards them by the extreme Republicans. But after the conversion of Pius IX. from Liberalism, the Church had given up the hope of winning over the Extreme Republicans, so that in this respect her fate was no worse than she had expected it to be. The policy of NAPOLEON III. was not one of subjection to the clergy; but the very means which he took to maintain his supremacy had the effect, as was very well explained some weeks since by a French Correspondent of the *Pall Mall Gazette*, of strengthening clerical influence. He made the priests the almoners of the State in the expectation that, if the money they dispensed in charity was all provided by the State, the State, and not the Church, would get the credit of it. What actually happened was the precise reverse of this. The poor saw that all the help that came to them came through the clergy, and they did not look beyond the actual giver. The Church came to be regarded as the only friend they had, and the clergy furthered this belief by extending its network of charitable organization throughout the length and breadth of France. Fortunately for the Church, a coolness between her and the Government had grown up some time before the fall of the Empire. The devotion to NAPOLEON III. which the clergy had shown before 1866 cooled very much after he had found himself unable to preserve the integrity of the Pope's dominions. In this way the Church was saved from the discredit which came upon the whole Imperial system after the capitulation of Sedan, and was left free to profit by the change in public feeling produced by that and subsequent disasters. There seems little doubt that adversity has caused a real reaction in favour of religion in the minds of many Frenchmen. Year after year they had been told by the priests that unbelief and want of devotion to the Church would bring temporal retribution upon their heads. Year after year their temporal prosperity had gone on increasing, and the predictions of the clergy had seemed less and less likely to be fulfilled. When they turned out to be true prophets after all, and Frenchmen found themselves suffering under an unexampled load of misfortune, it is no wonder that the men who had foretold the fact were assumed to be equally accurate in accounting for it. France had been punished as the priests had said she would be; was it not likely that she had been punished for the cause which the priests had assigned as certain to bring the penalty upon her? When the Church found herself in possession of the influence thus created, there could not be much question as to which of the rival claimants to power she should favour. The Republic was hateful to her on two grounds; first, because she distrusted M. THIERS's ability to keep it really Conservative; secondly, because she distrusted M. THIERS's inclination to make it clerical. She had no love for the Orleanists; for the French *bourgeoisie*, of whose opinions the party was the special reflex, has always been proof against ecclesiastical persuasion. The Empire was for the time an impossibility; and for some years previously to the war it had not been conducting itself as an obedient son. There remained the legitimate Monarchy in the person of the Count of CHAMBORD. Everything combined to make him the best candidate for ecclesiastical purposes. He was thoroughly submissive to the clergy, supremely devoted to the Pope, surrounded by a crowd of good Catholics, who would furnish candidates for every vacant office, opposed even more than Pius IX. himself to any compromise with modern ideas. The choice of the clergy was soon made. New and old miracles were alike pressed into the service of the Legitimist pretender, and hymns to the Sacred Heart, or to Our Lady of La Salette, were carefully loaded with a monarchical moral. If the Count of CHAMBORD can be placed upon the throne without making any damaging recantation of his former declarations, the Roman Catholic Church will possess what she has long wanted—a temporal monarch firmly devoted to her cause.

The writer of a recent article in the *Kölnische Zeitung* says truly that the accession of the Count of CHAMBORD "will be regarded as a declaration of war not only against modern France and her dearly-bought liberties, but also against

"modern Europe, whose recent re-arrangements can have no more determined enemy than he." As regards the most "recent re-arrangement," the Count shares this hostility with every possible ruler of France. Neither Monarchy nor Republic would be endured for an instant by Frenchmen if it required from them the abnegation of their determination to get back Alsace and Lorraine. It is doubtful, however, whether in other respects this hostility to recent re-arrangements of territory does not tend to damage Royalist prospects in France. Among the little group of fanatics who have the direction of the Count of CHAMBORD's conscience, the dismemberment of France is probably regarded only as a minor incident among these re-arrangements. The addition of two provinces to Germany is to be regretted as helping to aggrandize an overgrown Protestant Power at the expense of one which it is hoped is about to be reconverted to Catholicism. But the real vice of the recent changes in the distribution of power is the transfer of the Papal territory to Italy; all other changes are viewed as they are calculated to affect the permanence of this one. Had it not been for this, the Church would never have provoked a quarrel with the German Empire. Prince BISMARCK had no desire to make an enemy of the German clergy and no theological attraction towards the Old Catholics. But he was not disposed to undertake a crusade against Italy for the purpose of restoring the Pope to his temporal throne, and for this reason the Roman Church determined to cast him aside as an instrument not available for her purposes. If the Count of CHAMBORD is restored, the King's advisers will be willing enough to fan the national hatred of Germany, but they will not be equally willing to take any means that may present themselves in order to gratify it. The French have learnt the lesson of the late war with unexpected accuracy. They know that they are weak, and they know that the two main duties which their weakness imposes upon them are readiness to welcome every ally, and the patient concentration of their whole strength and purpose upon one object. The victory of Ultramontanism is unfavourable to the discharge of both these duties. Before an ally can be accepted by HENRY V., he must have shown that he is a friend to the Pope as well as a friend to France. With good management, for example, the alliance just effected between Italy and Germany might probably have been prevented, and the King's known leaning towards France have been gradually warmed into something like effective life. But not even to regain Alsace and Lorraine would the Roman Catholic Church approve an alliance with the sacrilegious Power that has wrested Rome from its rightful sovereign. The one object which she is set upon is the restoration of the Pope, and the restoration of HENRY V. is only valuable to her in so far as it promises to help on this paramount end. When the French people come to understand clearly that in the eyes of their King and his most trusted councillors the recovery of Alsace and Lorraine is only a secondary object, and that alliances which might further the attainment of it are wantonly sacrificed because they do not square with the designs of the Pope, it may be doubted whether political Catholicism will not lose any charms that it now possesses for them. They will in all probability be equally irritated by the discovery that the rigid abstinence from all share in European politics which is absolutely essential to the recovery of the military strength of France may at any moment be departed from, not in the interest of France, but in the interest of the Pope. It is true that the Count of CHAMBORD disclaims all notion of waging an imprudent war. But, even supposing his judgment on what constitutes a prudent war to be absolutely unerring, this will not constitute any guarantee against the strength of France being wasted in wars which only indirectly concern her. It is quite conceivable that a war with Italy in which France should be the victor might leave her so crippled in resources that she would be forced to lie quiet for a considerable interval. During that interval an opportunity of fighting Germany at an advantage might occur, and might have to be foregone by reason of the dissipation of her strength caused by a short-sighted, though successful, contest with Italy. It does not need very great keenness of vision to foresee these possibilities; and unless Frenchmen are altogether blind to them, their very anger against Germany may render them suspicious of political Catholicism.

POLITICAL FALSETTO.

MR. DISRAELI has perhaps some reason to complain of the obtuseness of the critics of his recent manifesto. They have failed to appreciate the peculiar nature of the performance, and have set to work to construe a string of epigrams as if it were an invoice. When CHARLES LAMB, in a company of Scotchmen who were all praising BURNS, expressed a wish that BURNS were present, he was gravely informed that BURNS had been dead for many years. Mr. DISRAELI must feel that the spirit of his remarks upon the Government has been equally misunderstood. He has certainly a right to appeal to his antecedents, and to ask whether he has ever said or done anything to warrant his being taken for a serious statesman. Mr. DISRAELI, it should be remembered, is an artist as well as a politician, and he has always appeared to regard politics as an art rather than as a science. It is therefore from an artistic point of view that his political efforts should be judged; and it is also necessary to bear in mind that in art there are two schools, the idealists and the realists, and that it is to the former that Mr. DISRAELI belongs. He has a political dialect of his own, in which words stand for very different values from those which they bear in common use. It might be supposed, however, that the key to this artificial tongue would by this time be pretty well known, and that the necessary allowance would be made for its ornamental extravagance. The picture of the civil war now raging in England is only a counterpart to the famous picture of the cabal of scheming English politicians and foreign intriguers which was represented some years ago as planning the ruin of the country.

The explanation of Mr. DISRAELI's peculiar eloquence may be found in the principles of a kindred art. Prosaic people have sometimes derided operatic performances on account of their absurd dissimilarity from real life. In real life, it is said, a pair of lovers who have met for a clandestine interview do not usually rouse the neighbourhood by singing a duet at the top of their voices, nor does an assassin remain after stabbing his victim to warble an air over the body. All this is very true. Ordinary conversation is not conducted in recitative, and the obdurate parent who orders his daughter's lover out of doors certainly does not do so in musical strains, with the disconsolate soprano and tenor joining sweetly in the choros. From a realistic point of view, an opera is undoubtedly about as absurd as anything that can possibly be imagined. But then admirers of opera would say that it is not intended to be realistic; it is an idealized form of art, and looks at results rather than means. The object is to produce certain impressions and emotions in the audience by a combination of acting and melody, and as long as these impressions and emotions are produced, it does not in the least matter that the representation should be utterly unlike anything in real life. Mr. DISRAELI might plead the same excuse for his manifesto, and for the sort of eloquence to which he has been training the more susceptible and imitative of his disciples. It is operatic politics in which airs and recitative are substituted for common talk. An effect is intended to be produced, not by sense, but by sound, and the charm of such a jingle as "plundering and blundering" is quite independent of any meaning that can be attached to it. It is supposed that it will comfort the Conservatives just as that "blessed word Mesopotamia" did the old woman at church. This sort of talk has, in fact, no more relation to realities than an operatic trio, or the elang of a stage sailor or stage Irishman. It is a conventional, symbolical, idealized way of putting things. When Sir F. SLADE denounces the Solicitor-General as a professional slave and political adventurer, and accuses the Liberals of seeking to bring up the young as atheists and devils; when Mr. DISRAELI describes party differences as civil warfare; or when a clergyman declares that he would not like to see Mr. GLADSTONE cut up into mince-meat, because he would make such an unsavoury pie—they are no more in earnest than the tipsy coalheaver when he curses his own eyes or invokes damnation on his neighbours. They are merely relieving themselves by a discharge of expletives.

It is impossible to suppose that orators and journalists who talk or write in this style really believe what they say, or expect the people to whom it is addressed to believe it; indeed they would probably be very much amazed to find that there was anybody weak enough to accept such fastian seriously. They are only blowing off steam,

and giving it to be understood that they do not altogether like the way in which things are being managed, and that in any case they have a natural and innocent desire to see their own side in office. My opponent, said a French writer, accuses me of theft, forgery, murder, and every kind of iniquity, but he only means that there is a difference between us on a point of grammar. The eloquence of the speakers who form themselves upon Mr. DISRAELI similarly requires to be brought down to the level of intelligible commonplace. It is, in fact, a purely artificial and conventional production, as artificial and conventional as a barrister's wig, which does not pretend to be a man's real hair, but is only a symbolical covering so obviously unreal that there is no mistaking what it is. Except on the stage or in a novel, nobody ever says "Alas," and nobody in private life is ever heard talking the sort of wild rant which is to be found in the ordinary run of Conservative newspapers, and occasionally in the speeches of county members at agricultural dinners. This extravagance is put off in private life just as the lawyer puts off his wig, or as the actor washes the rouge off his face and strips his calves of padding. Of course we do not mean to suggest that Conservatism is all a sham and pretence, but only that a certain class of Conservatives have unfortunately got into a way of talking in public which is altogether artificial and unreal, and which might be called insincere if it were not that those who indulge in it apparently take it for granted that it will not be supposed that they mean all they say. In the case of all the great measures of the Government there was room for legitimate and reasonable opposition. Even if the principle of a measure was sound, it might be argued that the mode in which it was proposed to be carried out was inexpedient, or that the time was inopportune. But even the most credulous partisan can hardly have believed that the Throne would be overturned, as Mr. DISRAELI predicted, if the Irish Church were touched, or that the army would fall to pieces the instant the purchase of commissions was discontinued. No doubt this sort of exaggeration had its parallel on the other side, and the evils which were predicted as a consequence of the policy of the Government were the counterpart of the magical results which were promised by its supporters. But exaggeration does not justify exaggeration, and Conservatives should remember that, after all, their safest ground is common sense.

The mischief of this fanciful and artificial language is that it not only misrepresents the tone of the party at large, but tends to discredit it with that great body of sensible and moderate people who compose the majority of the nation, and who do not happen to be either Liberals or Conservatives, but are anxious only for steady and competent administration, avoiding excesses on either side. It is also injurious to the self-respect, and, in some degree, to the sincerity, of those who thus habitually speak with affected violence or fear. They cease after a time to have a sound appreciation of the relation between words and convictions; and when, under the pressure of circumstances, they find it necessary to draw back a little from the strong language they have used, they hardly know where to stop. They have accustomed themselves to live in a world of phantoms, and at last become confused as to the boundary line between truth and fiction. Nobody knows how far they are in earnest, and they hardly know themselves. This sort of acting is necessarily destructive to moral discretion and taste, and its worst effects may not be discovered until too late. Mr. DISRAELI has somewhere said that in the government of nations imagination is a quality not less important than reason, but reason can hardly be set aside; and it is also well to remember that imagination and artifice are not exactly the same thing. It may be hoped that the manner in which the peculiar style of eloquence of which we are speaking has lately been received will convince those who have been in the habit of using it that it is neither creditable nor successful. The really Conservative forces in the country are not those which are most blatant and violent, and they are more likely to be conciliated by plain, straightforward, candid speaking, in the way in which people speak face to face among themselves in real life, than by a political falsetto put on for the occasion.

SCHOOL BOARD ELECTIONS.

THE results of the approaching elections for School Boards will in some respects be even more interesting than those of the first elections three years ago. The

working of the Boards will to some extent have been tested, and the rush of enthusiasm in which many of the original members were returned will have had time to consolidate itself or to die out. The magnitude and the cost of the work which School Boards have before them are becoming better understood. If the ratepayers now elect energetic representatives it will prove, far more than it proved in 1870, that they mean that this work shall be done. But the special significance of these elections is that they will be the first (except as regards London) to be held under the Ballot; and the substitution of secret for open voting may produce as important a change in the character of School Board elections as it promises to produce in the election of members of the House of Commons. Very much the same causes will be at work in the two cases. In the election for a School Board religious questions are often more directly and avowedly involved than in Parliamentary elections, and it is abundantly evident that nothing stirs men's passions so surely as religion. If, under open voting, men were tempted to use bribery or coercion for political ends, they were quite as much tempted to use them for religious ends. Indeed there were probably a good number of persons who would have done without scruple in a School Board election things which they would have refused, or at all events have hesitated, to do in a merely political contest. Religious people have greatly improved upon DAVID's tactics against GOLIATH. Instead of rejecting the armour offered them, they are often willing to lay hands upon all the weapons they can beg, borrow, or steal. If the coming School Board elections were to take place under the old system, much social pressure would be exerted by many who do not usually take any active part in public affairs. Women, for example, are often keenly interested in ecclesiastical contests, and this kind of pressure is precisely that which women are best able to employ. The circles in which it is not considered gentlemanly, or even decent to be a Liberal, are growing fewer every day, but there are many to be found in which the identity of respectability and churchmanship is assumed as a matter of course. On the other side may be set the regard for consistency and party discipline which prevents men from voting against those with whom they have been accustomed to act. This motive may very well have had considerable influence in open voting for School Boards. The Education League has contrived to identify itself with the advanced section of the Liberals, and a man who has steadily voted for the Radical candidate at Parliamentary elections may entertain a natural dislike to being convicted of having deserted his friends in an election in which, according to the League, Radical principles are directly involved. Yet in his heart he may feel that the two cases are very different. He has been taught to associate Radicalism with economy and diminished taxation, but the victory of the League will necessarily bring with it universal School Boards, universal School Board schools, and universal school rates. If he had still to vote in public, he would probably swallow the contradiction with the best grace he could command; but now that he can vote in secret there is no need for him to make the sacrifice. He can vote against the League without compromising his political character, or finding that his old friends look coldly on him.

Either way, therefore, the coming School Board elections may be of a different complexion from what they were in 1870, or would have been without the Ballot in 1873. There is now a fair chance of ascertaining the real magnitude of the religious difficulty. The elections for School Boards will show whether any appreciable number of ratepayers really object to the payment of school fees on behalf of indigent children attending Denominational schools, and whether they are so anxious as they are said to be that secular and religious instruction shall be given, not only in the same building, but by the same teacher. We shall not be surprised if on both points they turn out to be less resolute than extreme partisans on either side have described them. The mental attitude of the ordinary ratepayer is probably something of this kind. He wishes to have good elementary schools, partly because in many cases his own children will attend them, partly because he has been a little impressed by all the prophecies that have been addressed to him with regard to the misfortunes which will come upon the country if Englishmen remain in their present state of ignorance. But though he wishes to have good elementary schools, he wishes that they should be provided at somebody else's expense, and he will probably

see in the maintenance of the voluntary system a means of thus providing them. The result of this mixed feeling will be to make him a severe but not an unfriendly critic of Denominational schools. He will not be very much impressed by their religious aspect, for there is a large body of evidence to show that a parent's choice of a school is almost invariably determined by considerations either of excellence or of convenience, and the great mass of the ratepayers belong to the classes which send their children to elementary schools. But he will have a keen sense that it is to his advantage to get all he can out of the Denominationalists, and that, if he consents to suspend the creation of School Boards, or School Board schools, in their favour, he will thereby earn a right to insist that these schools shall supply the best education that can be got. If this proves to be a true reading of the ratepayer's mind, the compromise established by the Act of 1870 is probably as good a settlement of the education difficulty as could be devised. Even Mr. MONTEY admits that it is better to have secular education *plus* theology than not to have it at all; and if the ratepayers are determined to make the attainment of a high level of secular excellence the condition of continuing the permission to surround it with theological adjuncts, the community will be benefited, while the Denominationalists will have no reason to complain. It is exceedingly improbable that the ratepayers will be led by Nonconformist or Secularist enthusiasm to withdraw from the Church of England or from the Roman Catholics the liberty to give religious instruction to children of their own creed under specially convenient conditions, in return for contributing towards the cost of their secular education. But it is equally improbable that they will be led by Denominationalist zeal to put up with a low standard of secular education rather than sacrifice the theological infusion which now accompanies it. They will be more inclined to say, Take your children and teach them as much religion as you please, provided that you teach them other things thoroughly well. This is not a challenge which the managers of voluntary schools can have any right to resent. It would be unjust and impolitic to drive them out of the field so long as they comply with the requirements of the State as regards the quality of the education given in their schools; but it would be an extremely short-sighted economy to put up with an inferior quality of education merely because the Denominationalists were willing to bear part of the cost.

The Ballot is in future to be extended to the voting on a proposed application by the ratepayers of any parish or borough for the creation of a School Board. Wherever, therefore, fifty ratepayers in any parish in which there are more than one hundred and fifty ratepayers, or one-third of the whole number in any parish in which there are less than one hundred and fifty, are anxious that a School Board shall be appointed, they can summon a meeting to discuss the question, and any ten of them can demand that a poll shall be taken to ascertain the wishes of the ratepayers. It cannot therefore be said that any possible predominance of the Denominational element in a parish can avail to prevent the creation of a School Board, unless there is a numerical majority of the ratepayers opposed to it. Even in the typical case of a small country parish in which the Church school provides ample accommodation for all the children of school age, and the clergyman and the squire are bent upon keeping the education of the poor in their own hands, it is very unlikely that, if a majority of the ratepayers wish for a School Board, one-third of them will not be in positions of sufficient independence to enable them to give their more dependent neighbours an opportunity of checking the parson under the safeguard of the Ballot. If this opportunity is not provided, or if, when created, the School Board turns out to be by no means disposed to take upon itself the burden of educating children who are now educated without any cost to the parish, the Education League will be driven to confess that, though the ratepayers may be blind to their duty, they are not prevented from discharging it by any fear of consequences. A change which thus helps to bring out the real views of classes of persons on whose behalf partisans on both sides are so ready to make large professions will contribute towards the solution of several educational problems. Probably the ratepayer, now that he is left absolutely free to paint his own portrait, will be found neither so keenly theological nor so ardently irreligious as he has been depicted by sensational artists on both sides.

MAKING THE BEST OF THINGS.

THERE is no more generally accepted maxim amongst writers of sermons and moral essays than that which prescribes the duty of making the best of things. In one form or another it contains the pith of the consolation generally offered to us when suffering under any calamity. You have lost one of your dearest friends; you are exhorted to remember that if he had lived longer he would have suffered many more pangs; that if he had lived at Timbuctoo you would never have had the advantage of his acquaintance; and that if you had not paid him some proper attentions you would now have been bitterly reproaching yourself. In short, you are invited to send forth your imagination into the boundless regions of the might have been, and to take comfort in reflecting that beneath the actual abyss into which you have fallen yawns another conceivable abyss of which you have been lucky enough to stop short. From the most serious down to the most insignificant troubles of life the same kind of soothing ointment is applied to men's spiritual wounds. You have lost a fortune—rejoice that you have a pittance left to keep you out of the workhouse; you are suffering from toothache—be thankful that you have not also a pain in your stomach; a steady rain sets in just as you are about to take a holiday—congratulate yourself upon possessing an umbrella, and think of the beautiful lights and shades which might have been one monotonous breadth of sunshine. Everybody must have suffered at times under well-meant exhortations of this kind, whose conventional nature is indeed more or less carefully hidden, but whose substance is formed out of these old common-places. The general formula is painfully simple. However much you are suffering, the boundless fertility of human imagination will always enable you to picture some additional aggravation; it can hardly be said of anybody that all the avenues by which pain can approach him are so thronged that there is not room for some additional grief to force an entrance; and till that happens there is always room for applying this wearisome comfort. There are people who, if they saw a man being broken on the wheel, would remark to him that at any rate he had fine weather for the purpose.

Now to the unregenerate human being nothing is more vexatious than this mode of consolation. As a general rule, all comforters have been odious and disagreeable people since the days of Job. The difference between comforting a sufferer and triumphing over his misfortunes is occasionally imperceptible, and when the triumph takes the form of bombardment with moral platitudes it is especially offensive. The sophistry, moreover, is in this case so transparent that one feels that one's intellect is insulted at the same time that one's moral character is depreciated. The statement that "things might have been worse" is as universally applicable, and therefore has as little special application in any given case, as the statement that two and two make four. "Things might have been worse," said the man in a wise old popular legend, as the devil was carrying him off to hell. "How so?" asks his acquaintance. "Why the devil," he answers. "might have made me carry him." Fortunately, indeed, is the person who has not been irritated by friends acting in the spirit of this consistent optimism, and who take credit to themselves for so acting as though it were an indisputable proof of virtue. Of all the companions who ever drove an innocent man to the verge of distraction, probably Mark Tapley must have been the most intolerably offensive. He was of course a hollow impostor, though Dickens never found him out; for a man of genuine cheerfulness does not insist upon telling the world and himself that he is "jolly" every five minutes; but, apart from the question of sincerity, such a walking platitude, dashing his wretched little bit of morality in your face whenever you were out of spirits, would have justified his summary assassination—speaking of course from the point of view of the Western States. Mark Tapley, unfortunately, has become the prophet of a popular school. The fondness of his creator for him proves that Dickens took him to be really an admirable type of character; and accordingly he set to work proving in a hundred different ways that we ought to make the best of things, to look at the bright side of the world, and, so far as our own life is concerned, to ignore the fact that it is full of dark shadows and ominous forebodings. Although this school has fortunately declined in favour, its favourite dogma still retains a wide popularity, and few maxims are more irritating when retailed for private consumption, or more mischievous in their bearing upon public affairs. For the doctrine practically comes to this, that we are to reconcile ourselves to the inevitable hardships of life, not by accommodating ourselves to them as well as we can, but by making believe that they do not exist. It is well and right that human beings should retain as much cheerfulness as is compatible with the possession of anything like a soul. A thinking man cannot go through the battle of life in a state of rollicking exhilaration, but to get what happiness we can is plainly desirable. Everybody has to make up his mind, after a few years of experience, how he will aim at this end; and that man certainly makes the wisest choice whose provision for life includes the smallest amount of illusions. Most people arrange matters so as to put up with evils that might be remedied, and to attempt to meet the irremediable by blandly ignoring them. They run up a veil which serves pretty well for a time, and enables them to denounce as a cynic everybody who likes to look things in the face, but which of course disappears just when it is really wanted.

There was a time, as we know, when the doctrine was adopted by the philosophers, who undertook to prove mathematically that

"whatever is is right." They certainly did not succeed more than other philosophers in practically comforting mankind; and, on the whole, the world has not much missed poor Pangloss and the school whom he represented. When Pope tried to expound the same theory in verse, it took all the poetry out of his sparkling couplets. The essential discord showed itself when it was attempted to set the theory to music. A poet may be rapt into ecstacy by contemplating the beauties of the universe, or be plunged into despair at the horrors around him; but this placid optimism, which, without explicitly denying the existence of evil, proved that, in some way or other, it was very much the same thing as good, was totally alien to any true poetical mood. With the decay of the old schools both of poetry and metaphysics, this quiet fashion of skimming over the great problems of the universe went out of fashion. We are living in times when the wear and tear of life is far too great for any such flimsy armour of optimism. But the doctrine, though it is no longer current in the higher intellectual spheres, is as popular as ever at a lower altitude. We need not remark here upon the grave mischiefs which are worked by it in the sphere of politics or commerce. The evil results of saying peace when there is no peace are pretty generally recognized in theory. At the present moment we are content to put out of view the annoyances which it causes in private life. The propensity to make the best of things is generally found in combination with those smaller virtues which are more annoying to one's neighbours than most vices. The man who rises at five every morning, who always ties up his letters with red tape, and who is convinced of the great truth that it is better to be half an hour too early than half a minute too late, is frequently given to making the best of things. The duty of doing so is a moral maxim just big enough for him to understand. He probably reflects upon it in the early morning at the time when his cold bath is bringing out that glow, physical and moral, which makes him an offence to all weaker vessels during the rest of the day. The ruddy jovial person who gets himself up after the country gentleman type, or the more unctuous variety of popular preacher, is apt to be perspiring this doctrine at every pore. It is a pleasure to him to meet somebody in distress upon whom he may discharge boisterous comfort through his favourite aphorism as a fire-engine sends cold water through a hose. If he acquires some dim consciousness of the fact that his kind exhortations sound like a bitter mockery to his victims, it only increases his sense of virtue. They cannot comfort themselves under the loss of a wife by the reflection that they still have several first cousins and money enough to pay for a handsome monument. That only proves that they have not studied so well as he the great art of properly directing their sentiments. For of course he will deny in the most pathetic manner that he would ever advise anything like self-deceit. He does not avowedly ask a sufferer to profess that a toothache is rather a pleasant distraction than otherwise; he only recommends him to fix his attention upon his great toe or some other remote part of his body which may appear to be enjoying good health. And, in fact, there are some people so curiously constituted that a small pleasant object elevates them more than a great unpleasant object depresses them. They are people, so to speak, of small specific gravity, who cannot be submerged without a heavy burden of melancholy. The person who makes the best of things professes to be of this temperament. It is not, he would have you believe, that he does not sympathize with grief, but that his constitutional buoyancy makes sympathy in him compatible with exhilaration; he does not deny the existence of evils, but the smallest grain of good makes him happy, just as half a glass of wine makes some men drunk. There are, we say, such people as these—men, if we may coin a word, easily intoxicable. But we are inclined, as a rule, to a vehement suspicion in both cases. The man who is upset by the first glass has generally had a certain number of glasses before the first; and the man who makes the best of things is generally helped to be serene either by the absence of strong feeling or by the want of courage to look at the worst. There are of course a great many people who can make the best of their friends' misfortunes with surprising equanimity; but even a personal calamity, such as pecuniary ruin, often finds a man of this sort making the best of it. Before admiring we ought to know whether such calmness really indicates courage; it may signify just the reverse. A man who has never dared fairly to look into the state of his own affairs, and has thus got out of his depth without knowing it, is just the man to be cheerful, because he still does not look into the future, but calculates that on the whole his friends cannot still let him starve. To have a noble disregard for pre-dential considerations, to marry, for example, on general principles, and trust to your children being brought up by an enlightened public, is indeed generally regarded as a noble action; and it is certainly the legitimate consequence of making the best of things. Economists, however, have expressed some doubt whether such actions are beneficial either to the actor or to the nation; we are quite certain that they are anything but beneficial to his neighbours.

CHIVALRY.

DIFFERENT forms of the same word have often come, not only to bear quite different meanings, but to embody quite different sentiments. We do not mean such mere accidents as that which has happened to *cruen*, *quuen*, *quoon*, expressing, as it does, both the highest reverence and the deepest contempt, and

not being altogether in the primitive meaning from which it set out, that of *woman* in a purely colourless form, without expressing anything either way. This is a case of an accident within a language, and the same kind of accident happens between two cognate languages, when a word, starting from the same point in the two, rises in one language and falls in another, as in the familiar case of the English *knight* and the German *Knecht*. We are rather thinking of cases in which two words have been formed from the same root, at different stages of the same language, the meanings of which still remain in some degree connected, while the sentiment and train of thought which belong to the two respectively become quite different. Thus *chieftain* and *captain* are strictly the same word, meaning the man who is *caput* or *chief*, the literal translation of the old English *heafodman* and the modern German *Hauptmann*. Of these *chieftain* is strictly French, formed according to the regular laws by which French words are formed, while *captain* may be called either a later formation, or perhaps more accurately, a later importation, from the Italian; it belongs in either case to a later stage of the language. Of the two words it is clear that the older has the much wider and more general sense, while the use of the latter is much stricter and more technical. Yet among technical military terms it is plain that *captain* is the one which is least technical, and is most easily used in a more general sense. We can talk of the "great captain" of the age, but we cannot talk of the "great colonel" or the "great major"; that is to say, while the word *colonel* is a purely military word, invented for purely military purposes, and which has none but a purely technical military meaning, *captain* is a term of general meaning, which has settled down into a special technical use. But the kind of difference which we mean comes out most strongly in the two forms *chivalry* and *cavalry*. Each alike in its natural meaning implies riding on a horse and nothing more. *Chivalry* is the natural French word, formed according to the rules of the French language, while *cavalry* is the later form, analogous to *captain* as opposed to *chieftain*. The beast from which both words are formed, the *caballus*, who in later Latin turned out what had once been the nobler *equus*, shows himself in the one word in his French form and in the other in his Italian form. But the difference of meaning in the two words *chivalry* and *cavalry* has become yet wider than the difference between *chieftain* and *captain*. One has come to express merely the fact, while the other expresses the sentiment. *Cavalry* expresses simply the fact of riding horses for purposes of war, while *chivalry* has come to mean a certain state of mind which was once held to be the special attribute of those who rode horses for purposes of war. But it is not merely that one word expresses the fact and the other the sentiment; the parting off of meanings has gone much further than this. In the one word it is not merely that it expresses the sentiment as well as the fact. The notion of the sentiment has grown to such a pitch that the fact is altogether forgotten. When people talk about *chivalry*, chivalrous actions, and the like, they no longer think about horses. The word has got a meaning in which the horse is altogether forgotten. A chivalrous action is in strictness an action becoming one who rides on a horse, but in modern language it is quite possible that a chivalrous action might be done by a man who is always in the habit of walking on foot. Etymologically the word *chivalrous* could not be so strictly translated into English as by the word *horsey*, but it is plainly apparent that the two words have quite different meanings. *Horsey* of course is hardly a legitimate word at all; but it is a word which has been called into being, and its meaning is certainly not the same as the meaning of other words formed from other names of the same beast. *Horsey*, like *chivalrous*, expresses not a mere fact, but a sentiment, only the two sentiments are not the same. If we say that a man is in the cavalry, we simply express the fact that his military duties cause him to ride on a horse; he may be chivalrous, or he may be horsey, but the fact of his serving in the cavalry does not prove him to be either. Meanwhile the change in the constitution of modern armies has not only cut off chivalry from its connexion with cavalry, it has also cut off cavalry from its connexion with chivalry. In a Homeric, an Athenian, an early Roman, or a mediæval army, cavalry and chivalry were the same thing. All who served as cavalry belonged to the class from whom it is held that chivalrous actions are to be looked for; their serving in the cavalry was the outward badge of their belonging to that class. Nowadays, not the whole mass of the cavalry, but only its officers now belong to the class from whom we expect chivalry; or, if we are told that the common soldier is as much bound to be chivalrous as his officer, at all events a common soldier in a cavalry regiment is not expected to be chivalrous in any sense in which the common soldier in an infantry regiment is not expected to be chivalrous also. In short the difference between the two will be felt if we take Campbell's two lines:—

Wave, Munich, all thy banners wave,
And charge with all thy *chivalry*.

If instead of this we were to say—

Charge with all thy *cavalry*,

we should be making no change from the point of a philologist; we should perhaps be equally correct as a matter of military history; but we should have come down from a sentiment to a fact; we should have wiped out all the poetry.

What then do we mean by chivalry? Strictly, as we have seen, it means the estate or class of people who ride on horses—that is to say, for purposes of war. Then comes the secondary meaning of a

turn of mind, a moral standard, whatever we please to call it, which is thought to be becoming in members of that class. Lastly, the notion of horses and riding quite passes out of sight, and a chivalrous temper, a chivalrous action, and the like, become words which are used with a certain meaning of their own, always perhaps with a certain latent reference to the standard of a certain class of society, always perhaps with a certain latent reference to warfare, but certainly without any remembrance of the strict etymological meaning of the word. That the original military associations of the word never quite leave it is, we think, clear. When we apply it to conduct which has no reference to warfare, it is by a kind of metaphor; it is somewhat like the words *hero* and *heroism*. The proper field both of heroic actions and of chivalrous actions is warfare; it is only by way of analogy that either heroism or chivalry can be predicated of actions done in lines of life other than the military. Now both heroism and chivalry imply conduct of a special kind, conduct which is not exactly expected of everybody, conduct which has something in common with the theological notions about works of supererogation and counsels of perfection. The hero acts in a way—primarily in warfare, by a figure in other lines of life—which we admire in him, but which we do not expect in everybody. We do not blame a man for not being a hero. But the difference between heroism and chivalry is considerable. We should hardly call conduct heroic, unless we can give it unreserved moral approval. It is part of the idea of a hero that he should be fighting in a good cause. We may call a particular action heroic, even though the man who does it is engaged in a warfare which we deem unjust, but we do not call it so unless we really look upon it as morally right at that particular time and place. Louis the Fourteenth and Buonaparte were not heroes, for several reasons, among others because their warfare was unjust; but it does not follow that many heroic actions may not have been done by particular men in their armies. But when we speak of chivalry, the word hardly carries with it the same hearty respect, the same genuine moral approbation, which is certainly implied in the word hero and its derivatives. There is a lurking notion of the ludicrous about it; we speak of an heroic action with the same gravity, the same unreserved admiration, with which we speak of a saintly action; but we hardly speak of a chivalrous action without a kind of half smile. A chivalrous action, as the word is now commonly used, cannot be a base or sordid action; it may be a generous and self-sacrificing action; but it may very easily be an extravagant and uncalled-for action, which cannot be defended on any principle of right reason, which we do in a kind of way admire, but on which we do not bestow real moral approbation. Burke made a piece of fine declamation about swords leaping from their scabbards in the cause of Marie Antoinette, her beauty, and so forth. That the swords did not so leap forth was a sign that the age of chivalry was past. Now the motive which he thus appealed to was a purely irrational one. To draw the sword on behalf of the French Monarchy might be a perfectly right thing to do; whether it was right or not is a question of political morality. But whether a particular Queen was young and beautiful or old and ugly could not really have anything to do with the moral right or wrong of such a course. A purely irrelevant motive is brought in; a motive which we half smile at, which we half morally condemn, but which we still in a certain sense admire, and in a certain sense sympathize with. We hear in mediæval warfare of men doing some extravagant exploit, which could in no way profit the cause for which they were fighting, for their honour, for their knighthood, for the love of their ladies, or something of that kind. This is a kind of folly to which we give a kind of half-sympathy, because there is nothing base or sordid about it; but it is not the less folly, and mischievous folly, and distinctly deserves moral disapprobation. If it be true that Buonaparte once ordered a certain military operation, involving risk to part of his army, merely that Josephine might see the show, this is still more distinctly blameworthy. Still we do not blame it in the same way as if he had done the same thing for money or other personal advantage. It was a breach of duty in every way; but still, if he himself shared the risk, there was something of the chivalrous feeling clinging to it. But all these chivalrous doings are quite foreign both to the calm discharge of duty on the part of the conscientious general and to the more irregular and enthusiastic character of the hero. To expose either himself or others to risk without an adequate motive is no part of the character of a Washington or a Wellington; neither is it any part of the character of a Kanarès or a Garibaldi.

The truth is that chivalry, so far as it is a virtue, is the virtue of a class. That is to say, it is no real virtue at all. It may sometimes lead men to do actions which are in themselves morally right; but it does not lead men to do them because they are morally right. The soldier who does his ordinary duty because it is his duty—the hero who does his extraordinary duty because, under his special circumstances, it is his duty—are both acting according to the rules of sound morality. But the chivalrous man who does something for his honour, or for the love of his lady, is not acting according to any moral rule at all. He acts according to the standard of a particular class, to win the esteem of that particular class. Beyond that class we can hardly conceive chivalry existing. A clown may be a hero; but we cannot fancy a chivalrous clown. So far as the clown becomes chivalrous, so far he ceases to be a clown. We come round again to the point from which we started; chivalry is something which does not belong to men in general as moral agents, but only to one class of men, to the class who anciently served in battle on horseback.

Of the historic aspect of chivalry it is hardly possible to say

anything. Like the "feudal system," with which chivalry is commonly said to have some connexion, the thing is so vague that it is hard to say what it was, when it began, or when it ended. When Burke said that the age of chivalry was past, he would have been a good deal puzzled to say when the age of chivalry began. Yet we can see that there were certain ages when ideas which we may fairly call chivalrous had a greater effect on men than they had earlier or later. The thing seems to come by fits and starts; there is a burst under Edward the Third, and there is another burst under Elizabeth. The chivalrous feeling is one of the many substitutes which men set up for the simple law of right and wrong. So far as such substitutes put a check on any kind of evil, we can only say that any check is better than no check. The law of honour is often useful for men who cannot rise to the law of duty. The question however is whether honour, chivalry, and the like, have not really done more harm than good. They enjoin the strict practice of certain virtues under certain circumstances and towards certain classes of people. The question is whether this does not really discourage right dealing under other circumstances and towards other classes of people; whether the excess of courtesy and respect shown to knights and ladies did not tend to make men yet more contemptuous and merciless towards people below those ranks than they would otherwise have been. William Rufus is one of the first princes in whose mouth we hear the jargon of chivalry, as Francis the First is one of the last. Chivalry certainly did not teach either of them to practise either general humanity or general faithfulness to engagements. The character of Rufus in this respect is well worthy of study. He is one of the first in whose mouth we hear the talk about the "probus miles," the "preux chevalier." He allows certain Angevin knights who had been taken prisoners to go free on parole; some of his own followers suggest to him that they may possibly break their parole; he indignantly casts away the suggestion; he will not believe that a good knight would ever do anything so shameful. A Rufus acted on his own principles. He troubled himself very little about breaking either his coronation oath or his special promises to his people, he troubled himself very little about breaking his treaties with other princes, he troubled himself even less about the misery caused either by his wars or by his exactions. But to his strictly military engagements, to the promises made by him in his character of "probus miles," he was strictly faithful. The same picture will serve for many chivalrous princes since. There is perhaps some truth in the harsh saying that the perfection of chivalry was seen at the massacre of Limoges, when the Black Prince spared the knights who fought against him and murdered the unarmed citizens without regard to age or sex. If we compare this with pre-chivalrous times, with the wars of the Conqueror for instance, the knights might very possibly have fared worse; the mass of the people would certainly have fared better. Edward at Limoges certainly does not shine by the side of William at Exeter. And lastly, if there was one thing above all others to which chivalry ought to have led, it should surely have been the strictest and most self-sacrificing discharge of military duty. Yet the Knight without Fear and without Reproach, when he was called on to enter the breach at Padua on foot, thought the lives of himself and his brother-gentlemen too precious to be risked alongside of the lives of churls. The chevalier, in short, was the cavalier, and it was below him to do anything without the help of the beast from which he took his name. In fact, many of the tales which are told, both of Bayard and others, as wonderful examples of chivalrous virtues, often come simply to this—that the good knight forbore to do some remarkably base act. When we get to the famous last words of Philip Sidney, we have got out of the region of chivalry into something better.

PERILS BY LAND.

THE future historian of the year 1873 will not find his task an easy one. There will be many things hard for him to reconcile in the course of his researches. Here and there he will stumble across what appear to be signs of a certain civilization; in trade and commerce he will perceive abundant activity and ingenuity; he will note the advance of luxury, the rise of a higher educational standard, the birth of associations for laudable ends, a more intimate sympathy between classes; and yet at the same time, in spite of the eulogies of the writers of the day, he will be obliged to admit the existence of a dreary fatalism. Documents will be in his hands which will show how far this belief affected the minds of the people, who daily ran the risks of mutilation and death, of poisoned life and ruined constitutions, without a complaint. What will be the inferences he will draw when some such diary as the following, written by the P'opys of to-day, comes into his possession?—

"Edinburgh, October 1, 1873.—I have this morning added a codicil to my will which, in the event of my not reaching London in safety, will increase the comfort of my dear wife. There have, it is true, been only thirty accidents during the last few weeks; but the opinion seems to be prevalent that this low rate is not likely to continue. As yet I have been mercifully spared.—Mum. to put on my old Inverness cape, which would receive but little damage from a collision. I have promised my wife to telegraph to her from every station on my way. Lord! such is the natural uneasiness felt by those at a distance, and yet

to what expense does it put us! Oh the selfishness of the upper classes! On my arrival at the station there was many a carriage occupied but by three persons, who told me the other three places were engaged, and the guards said they had orders to reserve them. I was thus kept fully ten minutes endeavouring to find a place, which I did at last, to the evident annoyance of an old lady, who had secured, as she thought, a compartment to herself. To the great surprise and pleasure of the officials, the express started but half an hour late, and by disregarding some of the ordinary precautions while descending gradients and running over facing-points, we may make up seven minutes during the first two hundred miles. The rate at which we are now travelling is terrific; the oscillation increases, and I can hardly jot down these few words. I can scarcely read the instructions which relate to the communication with the guard. My fellow-passenger tells me frequently that she is nervous, which indeed, poor soul! she may well be. We were only thirty-six minutes late at the first station, where I telegraphed to my wife my safe arrival, which will please her mightily. Owing to the train not having pulled up to the platform, an old lady fell down on getting out, and broke her leg, which greatly annoyed the station-master, who said these mishaps were continually occurring, and caused much inconvenience. Shortly after we had left this station we met a cow and a flock of sheep running with great speed along the up line. I pray this may not lead to a sad loss of life. Many of the newspapers have been lately urging the Railway Companies to provide themselves with a device to guard against accidents arising from the escape of cattle, but the directors would never sanction or adopt an improvement which required any outlay on their part. To think of the silly people who believe in the force of public opinion nowadays, and talk of the directors being amenable to it, as if a man would spend a farthing to save any man's life save his own. It should by this time be pretty well known that the object of a Company is to carry passengers to a profit, and not with safety, and that there can be no reason for ceasing to kill the public until they have been so far diminished that there shall be none left to travel, and therefore none to kill. Why such and such a man is made director, I never could understand. My wife's cousin tells me he can travel for nothing, and no one ever went to a station without seeing him on the platform. Yet, though he is a director, he is a very simple fellow, and I would venture has no knowledge of what is the motive power in an engine.

"Here, at the next station, is a sad business truly. Our train on approaching it has run over two children at a level crossing, and killed them both. I had often heard of the dangers here, and it was but last month that the Company was urged to build a bridge, and they went so far as to pass a resolution. A man should have eyes in the back of his head to go abroad now. The nerves of my fellow-passenger have been much affected by this incident, as she says it is the first time she has witnessed the destruction of human life, which indeed proves that she has been but an indifferent traveller. We have now reached our third stopping-place, and are an hour late, which would in old times have been thought unpunctual. I was sorely in need of a little rest, but the train waited but two minutes instead of ten. This station was a terrible sight; there was none to give information to those of the poorer sort, some of whom said they had been waiting for hours unable to proceed. Owing to the throng I could not telegraph to my poor wife, so went to the refreshment-room, where a very bold girl made no answer to the questions I asked, being engaged in laughing with a commercial traveller. Tried a cup of coffee, for which paid sixpence; but the coffee was so burnt and the milk so sour that I was forced to leave it. I have heard that on the Continent soup and an excellent dinner is served for a small sum, but I greatly doubt it; for surely our country is the greatest in the world, and yet there are but few starving men who would eat a refreshment-room bun. This station was in a great town, but the room was but a little tap-room, with a bar reeking with beer and spirits which moistened everything that was laid upon it. There was dirt on the seats and the windows, on the hair and hands of the waiters, on the table-cloth, and the knives; a pitiable place truly. After leaving it, our next stage was like to have been our last, for after bounding along at the rate of fifty-six miles an hour, the compartment began to fill with smoke. My fellow-passenger's fears could not be allayed, so I, thanking Providence for the foresight which had induced me to read the placard, let down the window, found and pulled the cord of communication. This I did for the space of half an hour without attracting any attention, and had we not been obliged to pull up at a small station owing to a luggage train having broken down in front of us, we must soon have been burnt to death. To so many modes of destruction does travelling by railway expose us! The accident we learnt had been but a slight one; twelve trucks had been thrown off the line, and the stoker broke his leg, the guard escaping with a few injuries. It is said the cause of this was that a director kept a passenger train waiting for him some fifteen minutes. I pray this may not be my wife's cousin, though indeed, unless the loss of life were very severe, I do not think any censure would be passed upon him. While the line was being cleared I left my carriage and ascended the embankment to view the scene of the disaster. It is a strange thing how such hard materials can be smashed to pieces so completely. Shall not enter more about this in my diary, for every public journal has daily accounts of something similar. At last we did arrive in London,

after a journey which, if not prosperous, may be counted as above the average. On the platform were my wife and children, who had been anxiously awaiting my arrival for three hours, and showed great joy at my safe return. I hear that a public dinner is talked of at the office to commemorate my expedition, the last I trust I shall undertake for many years. I was pleased to discover that my apprehension about my wife's cousin was unfounded, for I hear he has now been out of England these many weeks."

We hope no one will consider that what we have written has any semblance of levity about it. It is only by continually placing the statistics of railway accidents before the public in some form or another that the subject will not be allowed to sink into the oblivion which is the lot of most questions, however great may be the momentary interest they excite. To travel by an express and to volunteer to Ashantee may now be regarded in much the same light, while continued service in an excursion train might justly entitle a man to the possession of the Victoria Cross. The boldest man trembles when he has been locked up in a compartment to be half burnt, drowned, maimed, or killed. During the summer months the Companies are perfectly well aware that the trains will be crowded, that delay is inevitable, and yet, in order to compete with one another, they issue advertisements which they know to be misstatements, and run risks which it would be ridiculous to call accidental. "We will not be responsible for anything," they say; "you shall have no convenience, no attention, and if we destroy or damage what we undertake to convey, we will only pay you a fraction of the value of what you have lost." By and by, no doubt, a passenger when he takes his ticket will be required to assent to a graduated scale of compensation in the event of his own death or that of his children. Five pounds will be the maximum paid for a healthy man, two for a woman, one for a child, and half-a-crown for a member of either House of Legislature, for whom the directors may naturally entertain the most perfect contempt, seeing that they are entrusted with the government of the country and are utterly powerless to check the growth of abuses. What the last straw will be that will break the British camel's or ass's back is not to be conjectured. At present his complacency and patience are not to be disturbed. Interest in some things, he can show, it is true. To what extent the ravings of cataleptic fanatics should be regarded as inspired, whether the present definitions of sociology may be accepted as final, are matters of real importance and worthy of his attention. On the other hand, the street he crosses, the line he travels by, the air he breathes, and the water he drinks, are out of his jurisdiction, and are to be commented upon by professional inspectors alone.

To criticize the minor discomforts of railways seems superfluous. Our den of so-called refreshment have been immortalized by Dickens, and remain unchanged. All is degradation, from the slatterns with greasy curls to the skeleton of the ham covered by a wire shade, around which the heavy fly peculiar to the refreshment-room slowly gyrates when it has exhausted the sugar on the last bath-bun. Many of the stations are a disgrace to any line which pays a dividend. It is only very lately that Birmingham has been made tolerable. Stockport, Huddersfield, and Wellington vie in squalor and want of accommodation, the latter station being an important junction used by the Great Western and the North-Western. Perhaps, however, Staleybridge, "a busy cotton town of more than twenty-one thousand inhabitants," as Murray informs us, deserves the prize for dirt and misery. Here again we believe two Companies are interested, the Lancashire and Yorkshire and the North-Western; yet the wretched hovel which is called the station is hardly as large as a dog-kennel. Through the crevices of the platform an abyss is visible, down which it seems as if some day the whole structure might be precipitated by a high wind, when the public would learn with satisfaction that a "new erection had long been in course of contemplation."

We should like to enter upon another class of perils, if we had space to trace the course of such rivers as the Irwell and Calder, and tabulate the cases of typhoid fever generated by their polluted waters. No life exists in or near them; the black stream creeps slowly by pestilential banks of slimy ooze, past stag-headed trees destroyed by poisonous fumes, and under bridges across which the traveller runs to escape the sickening smells which pursue him. Accessions of refuse join the river from time to time; the neighbouring beck, charged with filth, blue in colour, from which a thick white steam rises, adds its contents. Near it, by some hideous irony, is a placard declaring that boys who bathe will be taken up. If such an event ever took place, the actors might have been mistaken for the *genti fignipoe* in the seventh circle of Dante's Hell. A naturalist would do well to take his station by it to test the truth of Lucretian theories, and see whether *loca Aterna* did not exist in England into which birds fell in the middle of their flight. The Calder, as is well known, is a very useful river. It supplies the inhabitants of Wakefield with excellent ink, and at the same time with three-fourths of their drinking water. Whether the Irwell is much used as a beverage we do not know; perhaps it is only in request for the adulteration of milk. The municipal elections will soon arrive, and an imperial election will follow at no very long interval. A candidate would deserve well of his country if he discovered the meaning of the word nuisance, or enabled it to comprehend something else besides the pigstye that abuts on the high road. From political parties, however, nothing can be expected; problems of deep moment have first to be solved; and it is absurd to look for an answer to a practical ques-

tion from a man who is wrapt in doubt as to whether, in the event of a Republic, the Duke of St. Albans and Lord Cork should retain their offices.

THE CHURCH CONGRESS.

WE have had occasion in former years to point out that the Church Congress has a merely superficial resemblance to those gatherings at which the votaries of science, archaeology, or "social science" gather together. The admission to these Congresses is at the good pleasure of any one who cares for their objects, while the world which each of them addresses is variably the whole human race or that particular section of mankind which cares to recognize its existence. The Church Congress restricts its membership to the members of an existing community, and exhibits the singularity of claiming to cover the whole ground of an old highly organized institution by a purely voluntary association of recent date. It is strictly within its own right in so doing. If the Church itself can healthily assimilate this new element of activity, no one inside of it has any right to caviil, and whether the assimilation be healthful or the reverse is absolutely no business at all of that portion of the community which has declined to share in the burdens or the benefits of the Church of England. So long as the Church itself is strong and important, and the Church Congress counts for something in it, public opinion, in newspapers and elsewhere, will continue to magnify the influence of the gathering by continuing to praise or to blame it; and we think that man must be a very glutton of notoriety who is not well content with the share of public attention which this annual incident has won for itself. Our own view is that the Church Congress does useful work in various ways. It must always be beneficial to a large and scattered body of men—every one of them inclined to move within the limited circle of his own opportunities and prejudices—to be wakened up to the fact that there is no question without at least two sides to it; while the very fact of voting being prohibited encourages freedom of debate by facilitating the free emission of probable opinions which do not involve any division list. The selection of subjects and of the orators to start the debates rests at each term of the Congress with a local Committee, which has to consider what topics are of present interest and importance to the Church with enough of novelty to arrest a lively attention, and withal enough of maturity to have been thought out by men whose opinions are worth obtaining, and at the same time just not explosive enough to ensure a row. For example, at the late Congress, Church rates would not have passed the first test; nor possible terms of intercommunion with the Old Catholics the second; nor confession the third. The theoretical arguments against such limitation are obvious; its practical utility in a purely voluntary assembly of only four days' duration is equally palpable.

We hardly think that the subject which stood first for discussion at Bath—the relation of the Church to labour and strikes—was strictly germane to the end of a Church Congress, although it led to a paper by the Bishop of Oxford, which was both sensible and manly, in spite of some vague theorizing as to the "natural equity" of labour sharing proportionately in the profits of agriculture, to which more importance has been attributed than it appears to have held in the speaker's own mind. With the best endeavours of most of the speakers to give a local colouring to their advice, the social aspects of the question always were uppermost, and the only conclusion really attained was that the Church as such had better be neutral. On the other hand it may be urged that it was good policy to risk a disensuring debate in order to meet the unjust taunt that the Church is indifferent or hostile to the cry of distress sent up by suffering labour. Perhaps the best specimen of the practical value of the Congress in putting forward the two sides of a question each in its naked force was given when "the supply and training of candidates for Holy Orders" came under discussion. The Dean of Chester, formerly head of a distinguished public school at Liverpool, Canon Ashwell and Prebendary Church, principals of diocesan colleges, and Canon King, who has stopped from that post to the Chair of Pastoral Theology at Oxford, had successively read papers, or made speeches, characterized by remarkable powers of thought, in which they exposed from their experience the existing shortcomings of our system of theological training, and proposed remedies, all of them ingenious, and many practicable. Then the Bishop of Peterborough got up, and after very heartily accepting the theories as well as the statements of the preceding speakers, proceeded to sum up the "enormous practical difficulties" which were in the way. The question, from a material point of view, was one of supply and demand. Some of the most devoted clergymen in the country were actually breaking down for want of help, and could a bishop see them die at their posts while he exacted an impossible standard of ideal perfection on the men whom he could otherwise send to their rescue? The Bishop, as he put it, was a recruiting-sergeant in a time of war, when the standard had to be reduced. Here were the two views of the question—the theoretical and the practical—the evil and its possible remedy on one side, and the obstacles which seemed to postpone a complete cure to a far-off day on the other, put forward with more than usual talent. Society must be the gainer by such bold speaking, while, as we know, the first step towards meeting a complaint is to analyse the apparently dis-

cordant symptoms. But the Bishop of Peterborough's contribution to the discussion was not a purely negative one. He had traversed schemes for improving the quality of the recruits with a demurrer. He was ready with his proposal for making the most economical use of the men whom he had succeeded in enlisting irrespectively of their training. The practical dearth of clergy, so he argued, arose from the immovability of those who were actually at work. A liberal system of retirement should be created by voluntary munificence in aid of the "makeshift" Benefices Resignation Act for worn-out incumbents, so as to hasten the promotion; and then, said the Bishop, the old-fashioned notion that a large town parish could be worked by the regulation staff of rector and curate was as absurd an idea as that it could be lighted by a pair of wax candles. A college of missionary clergy, under the Bishop's orders, to go here and there as they were wanted, and give the assistance which the variable wants of each place demanded, has, he contended, become a pressing desideratum of our Church organization. This statement of the Bishop of Peterborough, which was totally unexpected, formed a very appropriate introduction to the debates of a subsequent day, upon the "increase of the episcopate," in which happily the diocesan of the future was no longer treated as an isolated policeman, but as the head of a constitutional organization of chapter, synod, and multiplied societies; and upon the "proper work and influence of cathedrals and chapters," when Canon Selwyn, Mr. E. A. Freeman, and Canon Norris developed the ideal reformed cathedral of the "old foundation" in its manifold aspects of usefulness, while Mr. Beresford Lloyd showed how far his Cathedral Act of the last Session would enable private munificence to contribute to the realization of the picture. It was shown not only that the reformed cathedral must go *pari passu* with the increased episcopate, but that in this very cathedral was found the germ of that college of missionary clergymen which, as the Bishop of Peterborough urged, was one of the most pressing spiritual needs of the day; while it was equally clear that cathedrals in co-operation with the old Universities were the best centres of that higher clerical training for which Canon Ashwell and Canon King so forcibly pleaded. A very powerful argument for the necessity of corporate combination of work in another department of Church activity had on the previous day been offered by Sir Bartle Frere in speaking of missions to the heathen. He contrasted the isolated and ineffectual results of single English missionaries—both Churchmen and Dissenters—tied down by the abundant coils of red tape provided by home Societies, and limited to what their employers chose to consider direct spiritual work, with the more complete system, the more practical aims and larger performances, of missionary organizations provided by Roman Catholics and Moravians, in which the object is to build up a Christian and a civilized community in the midst of savage heathendom, and where, in accordance with the design, the missionaries carry on the operations of social life side by side with their direct religious teaching. Sir Bartle Frere declared, from his personal observation at Zanzibar, that the Oxford and Cambridge Mission to Central Africa, which was successively conducted on such common-sense principles by Bishop Mackenzie and Bishop Tozer, had, contrary to the assertions of its gainsayers, been decidedly successful.

We should not omit to notice the very eloquent sermon with which the Bishop of Derry commenced the proceedings of the Congress, which, if faulty in any respect, was principally so in being so remorselessly fair to and against all parties as to make it pretty sure that its author would have trodden upon a great many very tender corns. Canon Lightfoot's brilliant essay, in which he reconciled the stability of dogma with elasticity in the expression of it according to the wants of the age, is a contribution to theological literature from which all parties may draw useful lessons.

A meeting not included in the original programme of the Congress was called with the sanction of the genial President, the Bishop of Bath and Wells, and under the Chairmanship of the Bishop of Dover, to hear a report of the Dean of Chester of the recent Old Catholic Congress at Constance, and generally to express sympathy with the movement. It would be not only wrong, but impossible, for English Churchmen at this stage of Old Catholicism to do more; but, considering the many affinities between that movement and the English Reformation, we think such expressions of friendly feeling desirable, now that the recognition of the Old Catholic organization by the Prussian Government has removed difficulties which might otherwise have occurred by the establishment of relations between the body which professes to maintain its identity with Roman Catholicism before June 1870 and a community which has long separated itself from Rome.

We could dilate on other interesting discussions to which the Bath gathering gave rise, including one on the relations of Church and State well argued out in a paper by Sir Stafford Northcote, and an animated evening spent in considering the duty of the Church to the masses of the people, at which Mr. MacLagan and the Bishop of Manchester spoke with much earnest gravity. But we have said enough to show that the value of Church Congresses is not to be tested by the well-reported and breezy quarters of an hour when it pleases Archdeacon Denison or some other jovial athlete to trail his casock. Exciting as such episodes may be, they no more gauge the real work of a Church Congress than a Whalley or an Ankerbon Herbert scene represents the habitual employments of the House of Commons.

GLASGOW.

NATHANIEL HAWTHORNE, who was not a bad judge on such a subject, has said in one of his Note-books that he is inclined to think Glasgow, in spite of the sternness and grimness of its aspect, "the stateliest of cities"; but it may be doubted whether it leaves so favourable an impression upon most of its visitors. The streets are mostly wide and regular, and the general architecture of offices and dwelling-houses, as well as of the public buildings, is handsome and substantial. The whole city is built of a particular kind of dark grey granite, as if out of the same quarry; and though a granite house may be ugly, it can never be mean. There is a natural nobility about the material which is not to be effaced, and the long perspectives of massive stone, uniform and even monotonous in their plain solidity, are certainly imposing. Any one who has walked through the streets of Glasgow in the clear dawn of a summer morning, before the dark canopy of smoke has gathered overhead, will hardly be disposed to question the justice of Hawthorne's epithet. But then, how often is there a chance of seeing Glasgow by such a light? On most days of the year it is steeped in wet grey mist, or wrapped in yellow vapour, and in such an atmosphere the granite looks doubly cold and grim and comfortless. The dirty streets, the plashing of the sloppy crowd, the dark grey houses, the pervading gloom above and below—everything combines to make the scene dismal and depressing. One is struck by the poor and slatternly look of many of the people; haggard men in broad bonnets and ragged frieze; troops of mill-girls with naked feet, scanty petticoats, and a dingy shawl round the head. Towards the Trongate and Saltmarket the squalor and the swarming, filthy wretchedness are pitiful in the extreme. With the exception, however, of the low Irish, who have a sort of quarter to themselves, the working-folk of Glasgow are, on the whole, a prosperous body, and might say with Meg Merrilies, "It's no that we hevna braw claes, but we dinna care to pit them on." They prefer to keep their finery for special occasions, when the shoeless mill-girl expands like a grub into a butterfly. Altogether the general appearance of Glasgow is hardly prepossessing to a stranger. It is the very reverse of a show town. There is nothing striking or romantic in its situation or construction. It is a busy, hardworking community, intent on business, and it has no loungers of its own and nothing to attract idlers from elsewhere. Buchanan Street is a handsome street with some brilliant shops, but the showy part of it is soon exhausted, and there is scarcely anything else of the same kind in the city. The wet climate, the smoke, and the universal granite masonry, all combine to produce a sombre and chilling effect. Glasgow is, no doubt, a handsome and stately city, but it is sadly deficient in brightness and colour. It is all grey stone and grey sky. You look in vain for a green leaf or patch of grass, and are thankful to come upon a dead wall with a circus advertisement. The bill-sticker alone relieves the dismal monotony of dingy grey. Flackeray mentions an elderly gentleman who, when he went to a party, being unable to dance, and yet desiring to contribute to the entertainment of the company, wore a large red velvet waistcoat. A few philanthropists of this kind would be a great boon to Glasgow; but something might perhaps be done with the uniform of the police to break the chromatic gloom. Natives will seldom admit that it is raining, but they allow that the weather is occasionally "soft." The degree of softness is explained by meteorological observations. Cairndow, on the banks of Lochfyne, is the wettest place in Scotland, and perhaps in the world. Last year it was drenched with a hundred inches of rain. At Glasgow the rainfall was nearly sixty-two inches, and in June and July it was even greater than at Cairndow. Under these circumstances it is not perhaps surprising that the City Chamberlain should think it necessary to suggest to the Town Council in his annual Report the consolatory hope that in another world at least departed Glaswegians will "bask for ever in the eternal glories of a midsummer's sun."

Glasgow is now the third city in the kingdom in size and population, and one of the chief ports; and it has the greater reason to be satisfied with its progress because it has been owing entirely to its own enterprise and perseverance. It made the river which has made its fortune. At the end of the last century Glasgow was only a petty market town, with a small quay overgrown with broom. The Clyde was a narrow, tortuous streamlet, almost beyond reach of the tide. Its course, far below Dumbarton, was broken by shallow lagoons, interspersed with low islets and marshy swamps. The Clyde is now as navigable as the Thames. In the course of some sixty or seventy years it has been deepened from about three feet to twenty-three feet. The works necessary for this purpose have been carried out with great energy and at vast expense. Since 1770 more than five millions and a half have been spent on this object, while the annual expenditure in maintenance and dredging is still considerable. The operations cannot be suspended, as deposits from above and tidal influence below would otherwise quickly restore the channel to its primitive condition. Fifteen millions of cubic yards of material have been dredged up during the last twenty-eight years, and last year the quantity was nearly a million cubic yards. There is probably no part of the country in which such rapid and yet such steady progress has been made as in Glasgow. In 1810 there were on the register only twenty-four ships, with a tonnage of less than two thousand tons; there are now nearly a thousand ships, with a tonnage of half a million. Ships to the value of some seven millions were launched last year on the Clyde, the aggregate value of all the vessels built

during the last ten years being nearly thirty-six millions. The Customs duties of Glasgow now form a tenth of the whole Customs' receipts of the United Kingdom. The rental of the city has about doubled in fifteen years. Figures are dull things, but figures like these are the best proof of life. The steady prosperity of Glasgow is no doubt owing to the number of different industries upon which it rests. If one breaks down for a time, there are plenty of others to keep it going. It is not only a great port, but the centre of an important coal and iron region; and almost every process of manufacture is represented within its bounds. Shipbuilding, engineering, cotton and woollen goods, shawls and muslins, flax-spinning, silk-spinning, carpets, chemicals, pottery, and glass-making—there are scarcely any of the great manufactures in which Glasgow does not compete; nor does it despise the minor ones. It is thus a great producing as well as a great commercial community, and includes a large variety of interests which all help on each other and quicken the pace at which the city progresses. In these things Glasgow has certainly a reward for its public spirit and enterprise, and some compensation for its unfortunate climate. People who do not mind being damp have every chance of making their fortunes.

In former days there was a chronic feud between the peaceful inhabitants of Glasgow and the marauding Highlanders, although, as in Baillie Jarvie's case, there were sometimes relationships between them. The mountaineers have now, however, come to form a considerable element in the city population. Glasgow is the favourite settling ground of Highlanders who have made any progress towards civilization. They find themselves more at home there than among the Saxons of Edinburgh, and there is of course a better chance of advancement. Away from the actual Highlands, there are probably more people who can speak Gaelic in Glasgow than in any other part of Scotland; and society has a distinctly Celtic flavour. Half of the population go by the name of Campbell, and the rest are nearly all McGregors or McDonalds. Reference to the Directory for the address of any one whose Christian name you have forgotten is therefore rather bewildering. There are traces of the Celtic nature in a certain fervour and quickness of temper, and a peculiar sensitiveness on the subject of national dignity. Celtic clubs assemble weekly or monthly to worship the thistle with abundant libations of toddy. Gaelic songs are sung, and the more romantic Campbells or McGregors divest themselves of trousers as a mark of respect to their freebooting progenitors. It might be a curious subject for inquiry how far the climate is responsible for the liberal consumption of whisky which is usually attributed to Glasgow; but the zeal of Celtic patriotism has no doubt a good deal to do with it. Glasgow has always been distinguished by its profuse and hearty, though sometimes perhaps rather overwhelming, hospitalities; but it is no less remarkable for its piety than for its conviviality. The gloomy fanaticism of former years has been mitigated, and "conspurgators" no longer prowl about the streets on Sunday to capture ungodly persons who have neglected to go to church. Yet it is only a few years since passengers by the Sunday steamer on the Clyde were stoned on starting or returning by the Christians on the banks. The intense dreariness and desolation of a Sunday afternoon in Glasgow can hardly be described. The long, blank, bleak streets are deserted, except when the congregations—the males all *de rigueur* in black, as if at a funeral—are pouring into or out of church. There is a story of some Scotch drovers who thrashed a man for looking cheerful on the Sabbath-day, and it would require some courage to attempt any levity of this kind in Glasgow. Apart from the services at church, the day is mostly spent in strict seclusion within doors; but it is supposed to be understood that there is no Scriptural injunction against the use of hot water and whisky. It may be admitted that there is not much temptation to quit the house. The streets are grim and gloomy, and there is no green country within easy reach. It is true that at one end of the town there is the old Green, and at the other the New Park; but the one is far from attractive, and the other rather out of the way. It is not surprising that during the greater part of the year the inhabitants of Glasgow should make a point of endeavouring to live at a distance from it. About May there is a migration towards the Bridge of Allan, and the summer and autumn are passed "down the water," at some of the pleasant places on the Clyde. During these months the greater part of the city is an absolute desert; and the tendency would seem to be to leave it sooner every year, and to go back to it later. The higher order of mercantile grandees do not live in Glasgow at all; they are established in baronial castles in the surrounding country, where they cultivate patriarchal habits with an odd mingling of the clan chieftain and the country gentleman.

There is an old jealousy between the two chief cities of Scotland, which time has not abated. Glasgow rather resents the nominal supremacy of Edinburgh as the capital, while Edinburgh is perhaps somewhat jealous of the exuberant prosperity of its Western rival. While the ancient city accuses the modern one of vulgar ostentation and materialism, and hints that Glasgow ladies dress only to show how much they can afford to spend, Glasgow sneers at what it calls the stuck-up gentility and intellectual affectation of the Modern Athens. Glasgow is a self-made city and a city of self-made men. It is socially democratic, though it has lately been growing politically Conservative, and the tendency of material prosperity is naturally towards costly display. The ordinary pursuits of the inhabitants do not run exactly in the line of intellectual study; and they certainly cannot be accused of academical affectations. The flutter of red gowns has been transferred from the old

town to the new; but the University remains as before a sort of High School, without the discipline of masters. By an odd custom, however, eminent statesmen continue to deliver grave addresses to a rabble of noisy schoolboys who pass by the name of "nations." It has lately become fashionable among the upper classes to attend, or at least to subscribe to, a course of scientific or literary lectures; and all classes have a more genuine passion for good music. There are frequently cheap and excellent concerts in the public halls, while the local aristocracy enjoy their own exclusiveness at private residences or subscription concerts, which are kept very select, and are sometimes given in a church. The traditions of austere Presbyterianism are opposed to the stage, but, though the theatre is little frequented except by the lower classes, Italian operas, having the stamp of fashion, are assumed to be quite compatible with a severe piety. Social enjoyments are, indeed, chiefly of a domestic order. On the whole, Glasgow possesses the attributes of an energetic, thriving, and wealthy community, which, as its prosperity increases, will no doubt be more disposed to cultivate the amenities and refinements of life. In its lustiness and prosperity, however, it does not apparently forget that it is only a city of mortals, though no doubt mortals of a very superior order. The Roman Emperor kept an attendant to remind him occasionally that he was only a human being, and Glasgow is provided with a Chamberlain who does not neglect to convey a similar warning in his annual Report. There are, he says, only six bigger cities in Europe. "Yet if we boast, it should be very gently." Babylon, Troy, and Carthage have been swept from the face of the earth, and the site of Glasgow may some day be a problem for geographers. This is certainly a wholesome frame of mind for a rich city to cultivate.

ANNUAL MEETING OF THE ALLIANCE.

THE report of a breach in the Alliance was unfounded. The few comparatively sensible persons who thought that by its interference in public it was doing more harm than good have yielded to the fanatical majority, and the Alliance will continue to do its best to damage the chances of the Liberal party at elections. Conservatives who may be disappointed at their own failures at Bath and Taunton may take comfort from observing that they can lose nothing, and may probably gain much, by the activity of the Alliance. It was indeed rather discouraging to Conservatives to find that at Bath the Permissive Bill candidate polled only fifty-seven votes, because at that rate the apprehended division of the Liberal party on this question has almost no practical importance. But Sir Wilfrid Lawson, who never, under any circumstances, despairs, is able to derive particular comfort from the Bath election. "A gallant man went to Bath with no other object than to tell the truth." If this were so, it may be hoped that the gallant man was not disappointed. It was predicted a year ago that the policy of Sir Wilfrid Lawson and his friends would destroy the Liberal party and break up the Alliance. Sir Wilfrid Lawson is obliged to confess that the Liberal party is at this moment "just a little shaky." So far, he says, the newspaper prophecy has been fulfilled; but with regard to the breaking up of the Alliance, he had only to look round the room where he was speaking to see that the second prophecy had not been fulfilled. The Alliance has not been destroyed; but it is at this moment more hearty, more healthy, more hopeful than ever it was. The wedge is still sticking in the timber, and a stout arm wields the mallet that will drive it home. The Alliance has been severely lectured for the course it took last year; but Sir Wilfrid Lawson thinks that the lecturing came from persons who hoped that the Alliance would support their views. In other words, certain Liberals fancied that the leaders of the Alliance still belonged to their party, and were amenable to its claims. But these Liberals were mistaken. The Alliance is for itself and nothing else. Surely Priam, and the sons of Priam, will rejoice to learn that there has been a secession from the Greek camp. There are, says Sir Wilfrid Lawson in effect, the Anti-Games-Law people, the Female Suffrage people, the Contagious Diseases people, and the Financial Reform people, all making themselves fools in their own particular ways, and we will make ourselves fools in our way. Surely a Conservative ought to remember every day with gratitude the divisions of his enemies. All these crotchets and many more have been contrived by perverse ingenuity for the torment of the Liberal Whip. Even the accession of Mr. Bright to the Cabinet, which has conciliated some varieties of fanatics, only increases the mischievous energy of the Alliance. They have been told by Mr. Bright that their proceedings show "a remarkable absence of wisdom," and they are anxious to justify his opinion. Mr. Bright is blamed for being ignorant that the Permissive Bill has been "in successful and beneficent operation" in the United States for the last twenty years. Mr. Bright, like other members of Parliament, is no doubt tolerably well acquainted with the course of American legislation on this subject. A Permissive Law certainly prevails in the sense that everybody does as he likes in New England. Sir Wilfrid Lawson remarks—we will not say complains, for he seems to like it—that after every Liberal defeat the newspapers lay the blame on the Alliance, and say that the only good it could do would be to commit suicide and get out of the way. But if the Liberal newspapers say this, we should expect that the Conservatives, on the other hand, would beg the Alliance and its worthy chief to take particular care of their precious health, and to avail themselves of the beneficial effect of change of air, by

attending all the contested elections of the kingdom. It must be rather discouraging to Liberals to hear the account which Sir Wilfrid Lawson, who at any rate is not a Conservative, gave of the present appearance of the Liberal party before constituencies. There are, says he, two parties, one of which is blue, and the other is trying to look blue. The admitted difficulty of distinguishing between a Liberal Conservative and a Conservative Liberal has been removed from many minds by the observation that the former is furthest removed from the possibility of being influenced by the Alliance. "The rival candidates wrote exactly the same things, and forthwith everybody rushed about the town and voted, not for any principle, but for a colour." This is Sir Wilfrid Lawson's description of recent elections. And he adds that, "as a rule lately, when this had taken place, the Tory had won, and very naturally." Borrowing a metaphor from the publicans, he says that people do not like adulteration, they like the real article. In short, they prefer blue to bluish red. As an observer of current politics, even Sir Wilfrid Lawson may have his value. Liberals, he says, have been trying to pass for Conservatives, and they succeeded pretty nearly, but not quite, and then they laid the blame of failure on the Alliance. Sometimes they say that the Alliance did too little, and sometimes that it did too much, but they always say that it has done mischief. We almost wonder that Mr. Disraeli does not write a handsome cheque, and send it to the Secretary of the Alliance as a donation from an anonymous admirer. He might be quite sure that he would make no mistake in doing that.

The Report of the Executive Committee of the Alliance shows that its members are well satisfied with their work, and if subscribers think that they have got value for their money, that is enough. In reference to the Bath election, the Report states that an earnest band of supporters of the Permissive Bill requested Mr. Thompson to become a candidate and accept their votes. In yielding to the earnest invitations of devoted friends—we observe that members of the Alliance are always earnest—the candidate did not contemplate the possibility that, by "organized ruffianism," all chance of propounding his principles would be hindered. Thus Mr. Thompson got no hearing and only very few votes, and all that seems to have resulted from his visit to Bath was an opportunity of protesting against the violence of "a band of men in party colours." The supposition that this band of men was organized to prevent Mr. Thompson going to the poll seems to us extravagant. If the enemies of the Alliance were judicious, they would hardly deny to its selected candidate the opportunity of receiving in a large constituency the votes of fifty-seven electors. We are quite willing to believe that these were earnest electors who declined to subordinate principles to party; but still, when you come to count noses the total of them was only fifty-seven. Still there is nothing like putting a good face upon one's failures. At Liverpool the managers of the Alliance felt confident that the candidature of Mr. Caine "would evoke considerable sympathy and active support." In this they say that they were not mistaken. The meetings held in his interest were "of a remarkable character as to moral tone as well as to political vigour." We think that all this is not much for the money; but then we are not subscribers to the Alliance. As regards the division in the House of Commons last Session, the Committee are aware that by some of the members of the Alliance the division was regarded with pain and disappointment, but the Committee are satisfied that everything is ordered for the best. They had calculated on a falling-off in their supporters as compared with previous years. The energy of their opponents, although it helped to defeat the Bill, was most gratifying to the Committee, as proof of their own progress in approaching the enemy's intrenchments. The Committee are at least able to comfort themselves by contemplating "that gallant band of ninety, unawed, fearlessly standing by sobriety, morality, and justice," in the face of a combination of Government Opposition and the publicans which commanded the votes of 330 members.

The Committee enter into a defence of their Resolution of last year, which comes in off to this—that the Alliance cannot be accused of interfering in politics because it is not political. The Council merely recommended constituencies to nominate candidates favourable to the Permissive Bill, and undertook to give these candidates "every possible support by deputations, lectures, and the distribution of publications." In the event of any constituency being unable to supply itself, the Council undertakes to find a "suitable candidate," and this is explained to mean suitable without regard to party. The Alliance may, for anything we know to the contrary, have had "suitable candidates in readiness," both Liberal and Conservative, and if both political parties have not equally availed themselves of the assistance offered to them, that has certainly not been the fault of those who offered it. We can easily believe that some supporters of the Alliance have been disturbed at the discovery that they would be expected to rejoice at the return of a Conservative if he pledged himself to the Permissive Bill. But still if these supporters have been reconciled to the policy of their leaders, that is enough. Money will doubtless be forthcoming to supply "deputations, lectures, and publications" to constituencies that desire them, and we may assume that, from a non-political point of view, the literary and oratorical efforts of the Alliance do not do much harm and may do a little good. The complaint of Liberal managers of elections is that the result of the operations of the Alliance, if there be any tangible result at all, is to divide the Liberal strength, and thus promote the return of Conservatives. But that complaint does not at this moment

concern us. The Committee think that their policy is not likely to be approved by opponents of the Alliance. We think, on the contrary, that opponents are likely to be well pleased at observing that an association, whose strength they may have feared, is wanting in discretion. It is almost an absurdity to suppose that the Alliance can supply, as it undertakes, candidates of either party, unless its leaders really go the length of saying that they themselves are ready to profess any principles, and support any Ministry, as long as they can get into Parliament, and vote for Sir Wilfrid Lawson's Bill. We can of course believe that a limited number of perfectly honest fanatics can be found to go this length, but we do not believe that an organization of such persons can permanently and strongly influence public opinion. The resolution of the Council "to develop an electoral department" is announced with the usual magniloquence of its authors. It has possibly received more attention than it deserves, and probably a little more experience will moderate the ardour of the promoters of the scheme. We must protest against the assumption of the Alliance that all the world is to be divided into the publican and the anti-publican parties. Many persons would say that they belong to their own party, and that they aim at preserving their own reasonable comfort and convenience.

THE SANDWICH ISLANDS.

A LECTURE on the Sandwich Islands by Mark Twain is obviously intended less to convey information than to furnish opportunities for the display of the lecturer's peculiar humour. Yet the sketch given of the history and condition of those islands ought to be interesting to Englishmen even if it were not enlivened by Mark Twain's jokes. There is indeed a dreary uniformity in the accounts which reach us from all the islands of the Pacific Ocean. Christianity, strong drink, and complicated diseases have been operating simultaneously, and everywhere population dwindles, and in many islands it threatens to disappear. The mountains and volcanoes of those islands are still almost unexplored, and perhaps travellers who have "done" the Alps and Pyrenees may advantageously turn their attention to Mouna Kea, of which the height is 13,587 feet. We think that Mr. Cook ought to turn his particular attention to islands which were discovered by another bearer of the same great name.

James Cook, who died at Hawaii, was born in Yorkshire in 1728. He was son of an agricultural labourer and farm-bailiff; he was apprenticed to a haberdasher, but procured his discharge, and entered the service of a firm engaged in the coal trade at Whitby. It was stated a few years ago that the ship in which he made his first voyage had arrived in the Thames with a cargo of coal from the North. Having risen to be mate, he volunteered into the royal navy in 1755. He was soon distinguished as a skilful and trustworthy seaman, and became master of a sloop, in which he served at the capture of Quebec. He took soundings of the river opposite to the French fortified camp, preparatory to an attack thereon, and he performed so well this difficult and dangerous service that he was afterwards employed to lay down a chart of the river from Quebec to the sea. This chart was published, and for a long time was the only one in use. In following years he studied mathematics and had much practice in marine surveying in Newfoundland and Labrador. The credit which he acquired in these employments caused him to be selected in 1767 to conduct a voyage in the South Pacific Ocean for astronomical and geographical purposes. He was promoted to the rank of lieutenant, being then nearly forty years of age. This was the sort of stuff out of which the masters of the British navy were made at the beginning of the French war, and this was the training of the men to whom British admirals looked for help when practical seamanship was needed in the conduct of a fleet. Sailing in search of a supposed Southern continent, Cook sighted the mountains of New Zealand, which had not been visited by Europeans since it was discovered by Tasman in 1642. Thus it is little more than a hundred years since the present seat of populous colonies was first seen by English eyes. In the same voyage he explored the Eastern coast of New Holland, and gave it the name of New South Wales. In his second voyage he discovered New Caledonia, the largest island in the Pacific next to New Zealand, and he proved the possibility of keeping in check that terrible enemy of early navigators, scurvy. In this voyage he lost only four of his ship's company, and only one by sickness. In his third voyage he made for the Friendly Islands, of which Fiji is now the best known, and, shaping thence a north-easterly course, discovered the islands to which he gave the name of his patron the Earl of Sandwich. It is remarkable that these islands had escaped the notice of the Spaniards, for whose trade they would have furnished a convenient halting-place, and also of Anson, who sailed into the Pacific to interrupt that trade. They are nearly in the latitude of Jamaica, and about two thousand miles to the south-west of San Francisco. Cook sailed thence to seek a North-East passage to Europe, and was stopped by the ice in Behring's Strait. Returning to winter at the Sandwich Islands he met his death. A boat was stolen; he went on shore to recover it; a quarrel ensued with the natives, ending in a skirmish in which Cook was killed.

The race of great navigators has now become extinct because there are no seas, except around the Poles, left unexplored. It is almost impossible to realize the vague dread with which the

Pacific and its islands were regarded only a century ago. Transportation to New South Wales was to the timid or the feeble a dreadful punishment, but to the young, bold, and active convict it was the opening of a road to wealth, if he had the sense to use it. In 1740 Anson commenced that voyage of which the journal reads more like a particularly clever fiction than a narrative of actual facts. He doubled Cape Horn with an ill-fitted ship and a sickly crew, stopped at the island of Juan Fernandez for repair and refreshment, sailed thence to the Spanish coast of America, which he kept for eight months in continual alarm; then he crossed the Pacific to Macao, where he repaired his ship, and sailing again, he intercepted the galleon coming from Acapulco to Manila with a treasure on board of 313,000*l*. Anson, like Cook, discovered early an inclination for the sea. But he, being of a good family in Staffordshire, got a start in his career which ended with a peerage. In 1787 Bligh sailed to Otaheite in the *Bounty*, which was employed to transplant the bread-fruit tree to the West Indies. The mutiny of the crew, the captain's voyage of four thousand miles in an open boat with the few men whom the mutineers could not trust, the subsequent capture and punishment of some of the mutineers, and the settlement of others in an island where they lived in happy obscurity for many years—all this formed a story which neither poet nor novelist could improve. The place where the mutiny occurred is close to Fiji, which now enjoys all the advantages of civilization as fully as the Sandwich Islands, and publishes a newspaper, of which copies are frequently sent by post to England.

The three voyages of Cook in the Pacific were interspersed between the warlike expedition of Anson and the beneficent mission of Bligh. In the first voyage Cook was accompanied by Sir Joseph Banks, who promoted the second and third voyages, and also the voyage of Bligh, in the interest of science and economy. The record of the third voyage is a sumptuous book in three volumes quarto, of which the first two were written by Cook himself, and the last by another hand after his death. The Sandwich Islands were first seen by Cook on the 18th of January, 1778. He was struck with the eagerness of the natives to obtain iron, "which it was plain they had only heard of, or had known it in some small quantity, brought to them at some distant period." When they first came on board they endeavoured to steal everything they fancied, so that Mark Twain's observation as to the commercial instinct of the Kanakas is confirmed by Captain Cook. "One of the natives, having stolen the butcher's cleaver, leaped overboard, got into his canoe, and hastened to the shore, the boats pursuing him in vain." Such a valuable article as a cleaver was doubtless immediately appropriated by the King. Even an iron nail was a fortune to the possessor, who let it out for hire to his neighbours when they wanted to bore holes. Cook laboured with indifferent success to enforce on his crew certain "regulations dictated by humanity." "I had been equally attentive to the same object," he writes, "when I first visited the Friendly Islands; yet I afterwards found, with real concern, that I had not succeeded." Cook was reluctantly convinced that these islanders did, on special occasions, and as a great treat, eat human flesh. The practice was more reprehensible here than in New Zealand, because the Kanakas were so well supplied with pigs when Cook visited them, that he had in salt pork sufficient for a twelvemonth's voyage. He describes himself as questioning an old man whether he would eat a suspicious-looking piece of meat, and the old man laughed at the simplicity of the question, and said that it would be very nice. The death of Cook is believed to have been caused by unprovoked violence; but, being dead, the natives picked his bones as a matter of course. Indeed he wrote a passage which curiously anticipated his own fate. An islander who wanted to get on board was refused, and he asked whether, if he should come in, he would be killed and eaten. He used such expressive signs that there could be no doubt as to his meaning. This gave an opening to retort the question as to his own practice, and another native answered, that if the strangers were killed on shore, the natives would certainly eat them. "He spoke with so little emotion that it appeared plainly to be his meaning that they would not destroy us for that purpose, but that their eating us would be the consequence of our being at enmity with them."

Cook was greatly struck with the fact that "the same nation" had spread itself in so many detached islands, so widely disjoined from each other, in every quarter of the Pacific Ocean. He found it from New Zealand to the Sandwich Islands, and from Easter Island to the New Hebrides—that is, over twelve hundred leagues from north to south, and sixteen hundred and sixty leagues from east to west. He calls it, "though not the most numerous, the most extensive nation upon earth," and he was nearly right, for the Russian Empire, although extending much further from west to east, has less depth from north to south. The excellent situation of the Sandwich Islands was obvious to the practical eye of Cook. If they had been discovered earlier, he thought that the Spaniards would have made them a refreshing place to the ships that sailed annually from Acapulco for Manila. They lie almost midway between Acapulco and the Ladrones, "which is at present their only port in traversing this vast ocean," and it would not have been a week's sail out of their common route to have touched at them, nor would there have been any hazard of losing the passage, as the islands are sufficiently within the verge of the easterly trade wind. An acquaintance with these islands would have been equally favourable to our buccannery, who used sometimes to pass from the coast of America to the Ladrones with a stock of food and water scarcely sufficient

to preserve life. Here they might always have found plenty, and have been within a month's sail of the very part of California which the Manila ship is obliged to make. "How happy would Lord Anson have been, and what hardships would he have avoided, if he had known that there was a group of islands half way between America and Tinian, where all his wants could have been effectually supplied!"

It appears that Mark Twain went from San Francisco to the Sandwich Islands to supply himself with a fresh subject for humorous description. "The extensive continent of America to windward" has sent to these islands in the course of a century many things besides portions of floating wreck containing scraps of iron. Missionaries have carried on their work so successfully that the establishment of Christianity has anticipated by a considerable period the extinction of the native race. But that race is doomed all the same. American sugar-growers occupy the coast, and the interior is unknown alike to native and stranger as it was when Cook first touched there. The lecturer's description of the beauty of the scenery and the grandeur of the volcanic operations is fully confirmed by earlier visitors to the islands. In Cook's time the only quadrupeds on the islands were the pig, dog, and rat. The two former were used for food by the natives as they are now. Mark Twain confessed that he could not understand why these islands should have been put in such an out-of-the-way place, so that he had to sail two thousand miles to get to them. It is, we think, convenient that there should still be some places in the world not easily accessible. But as regards these islands, Cook the second will certainly complete before long the work of Cook the first.

THE PARIS THEATRES.

THE English public, like other publics, possesses a terrible power of generalization. Two years ago some of the best members of the Comédie Française, the best company of actors in the world, paid a visit to London, and opened their season with classical plays. At first they played to empty benches; gradually the houses began to fill, and presently they made the success they deserved. They were seen to unusual advantage; for, owing to the small number of the troupe, the most insignificant parts were often filled by the greatest actors, and we saw M. Delaunay, perhaps the most finished and perfect actor among them, coming on the stage merely to deliver a letter with a word of explanation. Upon this the critics began to generalize, and held it up as an example to English actors. We were told that this was the custom of the Comédie Française; that by this condescension of a great actor to the part of a servant the harmony of the whole performance was secured. But in Paris, where there are plenty of people trained to appear on the stage as servants, M. Delaunay would no more dream of doing such a thing than would Mr. Irving in England. No doubt the fact that such things were done because they were necessary did help the general effect, and gave the English public a better chance of seeing and understanding what the climax of dramatic art is. And in time they did understand it, and as soon as they had understood it they began to generalize, and to reason that, because the acting and system of the Français is nearly perfect, therefore all French acting and all French dramatic systems are nearly perfect. Whatever has appeared in London in the shape of a French company since that time has been sure of success, and we have always been hearing the evil system of long runs in London compared with the continual change of piece which obtains in Paris.

Those who have instituted this comparison forget that a continual change of pieces, all well acted, can only be secured where a theatre is supported by a subsidy, and enabled to maintain a large staff of competent actors, and that very few of the Paris theatres are subsidized. At this moment there are many pieces enjoying a long run in Paris; foremost among those which are not essentially musical is *Le Gascon* at the Gaîté, a drama in nine tableaux, which begins at a quarter-past seven and is scarcely ended at midnight. It is a piece of the kind which M. Fechter attempted to make popular in England, depending upon exciting situations, picturesque grouping, continual action, and plenty of limelight and swords. The Gascon, who is called Artaban de Puyecelan, is the typical Gascon who appears under the name of D'Artagnan in Dumas's well-known romance, and under many other names elsewhere—an adventurer with a light heart and purse, who makes his way to success by his audacity and his natural gifts, in spite of the obstacles which Fortune throws in his way, or appears to throw; for it is evident to the spectator that the goddess really looks upon him with a favourable eye, and is bent on assisting him, while she pretends to discourage him for fear of compromising herself too much. This hero arrives at Paris in a penniless and tattered condition, and instantly finds a servant who provides him with money, and a mistress who takes care of him when he is wounded in a duel. He assumes the part of an ambassador from Gascony at the Court of Marie Stuart, in order to introduce to her Châtelard, who has helped him out of a scrape; he is beloved by one of her attendants, Stella Roselli; obtains a ship to convey himself and a chosen band to Scotland for the purpose of watching over the Queen at the price of a boxing match with the captain; defeats the infamous plots of Lord Maxwell against the Queen, and, in short, does all that a Gascon who is the hero of a melodrama ought to do. The piece is good of its kind; it has much liveliness, much incident, and possesses

the great merit of never trenching on the boundaries of the possible. Its harmony of extravagance is so well preserved, that the spectator is not in the least surprised to find a troop of ballet-girls in remarkably short checked petticoats, which stand for kilts, performing a grand Scotch ballet, the music to which is supposed to be supplied by a bagpiper whose costume is a mixture of Malvolio's, an old woman's, and a Hussar's, in the grand hall at Holyrood. To historical accuracy the authors—for there are two—make little pretensions, but they compensate for this by putting in a great deal of "scandal about Queen Elizabeth" and "Sir Dudley, duc de Leicester." Some of the tableaux are finely conceived—notably one in which the Queen passes into Holyrood under an arch formed by the swords of the faithful adherents who have just rescued her from the fury of a mob, who surround her with cries, which sound comic to English ears, of "Vive Calvin!" The scenery is poor; the grouping and dresses are good, but woefully wanting in the attention to detail which is to be observed at the Français, and now also at one at least of the London theatres. For instance, Lord Darnley wears the garter, which he has probably filched from the English ambassador, who appears without it; and a boy who climbs a scaffolding to see the Queen off from the shores of France, appears to welcome her at Edinburgh in the same attitude and costume on another scaffolding. We hope that the strong sense of his vocation which alone could have led him to undertake such a voyage with such a purpose was not mistaken. The part of the Gascon is played by Lafontaine, sometime a member of the Français, where he appeared to great advantage in parts requiring a certain hardness; and his excellent impersonation of the stiff Colonel in the *Fils de famille* will be remembered by those who saw it at the St. James's Theatre. Such a part as that which he is now playing is not suited to his powers; he has no spontaneous gaiety and lightness, no real charm or grace of manner. Wherever a serious or declamatory passage occurs he is admirable, and with the rest of the part he does all that intelligence unaided by natural gifts can do, but he does not make it what it ought to be. Fechter in his best days could have played it, and possibly Mr. Emmett might now, so as to enlist the sympathy and admiration of the audience throughout, and to create a romantic interest in the man. As it is, we fail to find this, and can only admire the skill of an actor who plays with so much success a part which he should never have undertaken. Madame Lafontaine, who used to play *ingénue* parts to perfection at the Français, is as unsuited to the part of the Queen as is her husband to that of the Gascon, and, like him, is so good an artist that she cannot be said to play it otherwise than well. She makes the most of the scene in which she is shut up alone with Châteaufort, the doors guarded by Maxwell's followers, from which compromising situation she is of course saved by the address and courage of Puyecerdan; but she has not the dignity or presence which a stage queen should have. The piece is extremely popular, and cries of "Vive la Gasconne!" from patriotic Gascons may be heard in the gallery as the curtain falls. One detestable custom prevails at this theatre—that of employing an act drop covered with advertisements; so that when we have seen the hero left for dead in the snow, we are not allowed to see him revive in the next tableau until we have learnt that at the sign of the "Grey Riding-coat" one returns the money if the clothes do not fit.

At the Folies Dramatiques another long run is going on. There the *Fille de Madame Angot* has reached its four-hundredth night. The music is pretty and sparkling, but neither that nor the piece possesses any extraordinary merit. The manager is anxious to bring out a new piece, and has attempted to weary his audiences by substituting indifferent artists for those of the original cast; but, in spite of all his efforts, they flock every night in numbers to the small theatre, where they are packed far closer than any London manager would dare to pack them. Any one who wishes to form an approximate idea of the Black Hole at Calcutta had better go to the Folies Dramatiques while the *Fille de Madame Angot* is still in the tide of success.

London is not the only place where people will run like sheep, night after night, to see an indifferent piece which has by chance made a hit. Meanwhile at the Français, where there is, as always, much to see and study, M. Mounet-Sully continues to assure his claim to a high rank on the stage by his performance of Hippolyte in Racine's *Phèdre*. M. Mounet-Sully has the natural advantages of a fine presence and a smooth sonorous voice. He makes use of these to better effect in such plays as Racine's than in any other, because he has the imaginative faculty strongly developed, and is therefore more successful where some warmth and energy must be supplied by the actor to the poet's work than where the author has completely carried out his own idea and left nothing to be added by its interpreter. The passion which, infused by the actor into the measured diction of Racine, fills up what is wanting in the character as written, is out of place in such plays as Victor Hugo's, which are already full, even to overflowing, with emotion. Thus M. Mounet-Sully's performance of Didier in *Marion Delorme* degenerates sometimes into extravagance. A tendency to bursting too suddenly into violence of tone and action is indeed his great fault; but this has much diminished since his first appearance at the Français, and will no doubt in time vanish altogether. In *Phèdre* he has seized accurately the rugged untamed nobility of the character, to which a certain wildness in his appearance readily lends itself; and while his fine action and delivery give additional grandeur to the grand, if stilted, lines of the poet in passages of rhetoric and description, his interpretation of subtle phases of feeling is no less excellent. His finest scene is that in which he

listens to his father's unjust accusations, trying in vain every means except a counter-charge to refute them, and finally goes out in despairing silence to meet his death; and this is magnificently played with voice, face, and gesture. The passage in which he begins to break out into the truth, and stops himself with a cry of "Je me tais," is rendered with a terrible fidelity to nature; and the remainder of the scene up to the exit, daringly given with an inarticulate expression of grief, leaves the true tragic stamp on the mind of the audience. Equally good, though on a less grand scale, is the love scene with Aricie, where the fine simple nature of Hippolyte is brought out with great skill. M. Mounet-Sully's whole performance is full of thought and study, and full also of dramatic instinct. Madlle. Sarah Bernhardt, another late addition to the company, plays Aricie with much grace, and is especially remarkable for the excellence of her diction, while M. Maubant's force and dignity of style come out well in the part of Thésée. Madlle. Roussel is hardly up to the very trying part of *Phèdre*. She has all its traditions, and knows exactly how to play it without possessing the force required to play it. A third and yet newer recruit to the ranks of this theatre is M. Pierre Berton, who has for a long time enjoyed a success as first lover and romantic hero at the Odéon. So great indeed has been his reputation there, that he has been frequently spoken of as second only to Delaunay. If this be so, his translation to the Comédie only proves how wide is the gulf between first and second, and how much lower the standard of other theatres than that of the Français, on the boards of which M. Pierre Berton's want of grace and finish are, at present, painfully evident. Amongst his *débuts* the part of the Marquis de Presles in *Le gendre de M. Poirier*, long associated with the name of Bressant, has been chosen, and the contrast between that actor's noble and dignified bearing and the ungainly demeanour of the present representative of the part tells heavily against M. Pierre Berton.

M. Delaunay has been appearing principally in the *Nuit d'octobre* of Alfred de Musset and in the *Menteur* of Corneille—perhaps one of his best impersonations; the airy gaiety, the ringing voice and laugh, the reckless abandon, and the unstudied courtliness which M. Delaunay brings to the part carry the sympathy of the house with him from his first entrance to the fall of the curtain. Those who only know this play through Foote's vulgarized version and Mr. Charles Mathews's performance have no idea of the original. Mr. Mathews seldom fails to be amusing, but his Liar delivers his falsehoods as occasion arises with a dry volubility which could hardly fail to ensure detection. M. Delaunay's *Menteur* is entirely the creature of an overstrong imagination; you see that the crowd of gorgeous ideas in his mind must find a vent; and when once that is given, he follows upon lie as a natural result, until a harmonious structure of fiction is built up of such beautiful proportions and materials that it is an actual disappointment to see it destroyed. When it is so evident that the *Menteur* himself believes in his own lies as they flow from his fertile brain, it would be impossible for his listeners to refuse their credence. The climax of invention is reached in the story of the secret marriage and its results. The agony of confession and fervour of affectionate interest with which, kneeling at his father's feet, he reveals to him with horror the delicate situation of an imaginary wife, carry conviction irresistibly with them. The high comedy of this passage is enhanced by the admirable byplay of M. Got, who, as Cliton the valet, kisses the skirt of his master's cloak at this point with reverent admiration. Whether Corneille's play would be very amusing without the fine intelligence and brilliant execution of M. Delaunay is an open question; but, as it is, the very recollection of it provokes laughter. M. Delaunay's *Menteur* would be more properly called a romance than a liar; and this interpretation of the part saves the father, who, as rendered by M. Maubant, is a personage of considerable dignity and interest, from ever appearing ridiculous.

But it is in *La nuit d'octobre* that M. Delaunay is seen to the highest advantage. It is noteworthy that the announcement for performance of this poem—for it can hardly be called a play—which contains no incident and has no attraction of accessories, which is simply a dialogue in verse between a poet and the Muse to whom he confides the story of his blighted love, never fails to fill the theatre. It is indeed a beautiful poem, and new beauties which do not occur to the mind in reading it are brought out by the wonderful acting of M. Delaunay and Madlle. Favart. It is difficult to realize the fact that the poet—pale, jaded, exhausted with sleepless nights, brooding over bitter memories, bursting now into extravagant denunciations of the woman who has been faithless to him, now sinking into weary, silent grief, finally making the effort to which the Muse urges him with a persistent tenderness, and shaking off the old sorrow to take up his work again—is the same actor who appears as the gay, laughing *Menteur*. Madlle. Favart's statuesque, yet tender, impersonation of the Muse makes a fine contrast to the impulsive passion of the poet, and the whole scene leaves a deeper impression on the audience than do many tragedies which deal with wider interests.

A new and pretty one-act comedy, called *L'été de la Saint-Martin*, by MM. Meilhac and Halévy, has been played many times at this theatre. It is just one of those pieces which cannot be seen in perfection at any other theatre, and can scarcely be seen at all in England. The plot is extremely slight, and has no element of novelty to recommend it; the dialogue is easy and natural, and at times witty, without any laboured smartness and without any of that handying to and fro of rude repartee which passes for wit in some English comedies. But the success of the play depends in fact upon the delicacy of the acting, the burden of

which rests chiefly upon M. Thiron, who is as good and finished as ever in the character of an irritable and amorous old gentleman, and upon Madlle. Croizette, who has not long joined the company of the Français. She is a clever and graceful actress, with a great deal of playfulness, and will do very good service in high-comedy parts; her fault is one which is not often met with at this theatre—a rather indistinct and hurried utterance. The rest of the cast is filled up by Madame Joussain and M. Pierre Berton, who, fortunately, have very little to do.

Manuel's pathetic little piece *Les Ouvriers* continues to be successful, and to give M. Coquelin the opportunity of showing that he can do far higher things than low comedy, his performance in which has of late shown signs of degenerating into overdone byplay and grimace. One fact which ought to be mentioned in connexion with the Français is that M. Regnier, one of its most distinguished members, has returned to the scene of his former triumphs to give his valuable services as stage manager. At the Porte St.-Martin, *Maria Tudor*, to which the management were reduced for their opening piece by the prohibition of *Le roi s'amuse*, as it was the only other piece of Victor Hugo's which had not been lately represented, continues to drag on its somewhat weary length. It is chiefly remarkable, as far as acting goes, for the fire which M. Lemaître still manages to display in the small part of the Jew, and for Madame Marie Laurent's spirited performance of the Queen, which, however, bears so much of the mark of the boulevard that the words "*Je ne baisse pas la voix, il me semble*," produce an effect not altogether tragic. At the Grand Opéra Madlle. Fides-Devries has made an unaccountable success in *Paul*, and that great artist M. Faure continues to draw crowded houses with the *Coupe du roi de Thulé* and *Hamlet*. We may seem to have spoken at great length of the Comédie Française, to the exclusion of other theatres, but the fact is, as we have said above, that those who would find a temple of dramatic art where the system of "runs" and "stars" is unknown, where plays are mounted and characters interpreted with a study and finish that approach perfection, where the excellence of the individual is valuable for its part in the harmony of the whole, must seek it at the Français and not elsewhere.

ART AT THE VIENNA EXHIBITION.

VIII.

IN this concluding article we shall continue and complete the account which we began in a previous paper of the old and historic works within the Exhibition. Two countries only remain to be noticed—Russia and Austria; we shall commence with the former.

Russia has not contributed to Vienna so liberally of her unexampled historic stores as she did six years since to Paris. Yet exceptional interest attaches to more than three hundred specimens of metal-work, distributed over twelve cases, and illustrating the history of Russian ornament from the fourteenth to the seventeenth century. It is well known that the old religious pictures in the churches of Moscow and elsewhere, of which a few copies are here shown, have no more art value than that which belongs to the debased form of the Byzantine style. But it is also a fact that the sacred paintings in the Russo-Greek Church are not only framed but covered with highly-wrought plates of silver and silver gilt, frequently enriched with jewels of great beauty and worth. We remember to have seen on the Ikonostas in the Cathedral of the Assumption in the Kremlin a picture of the Madonna, said almost as a matter of course to have been painted by St. Luke, which was encased with metal-work and loaded with jewels valued at 45,000*l*. And one of the many anomalies presented by the sacred arts in Russia is that, while the ancient Church pictures are low in style and corrupt in type of the human figure, the accessory art of surface ornament, comprising repoussé work, chasing, enamelling, and other inlays, together with the setting of precious stones, belongs to a true and a vital school. Many of the examples here exhibited—such as silver-gilt glories for the heads of saints and plaques which cover the whole surface of a picture save the faces, hands, and feet—are all but perfect pieces of surface decoration. The style in its historic basis is Byzantine—a style which, in its original habitat in the Eastern Empire, and even in its offshoots at Venice and Ravenna, maintains almost in perpetuity an exquisite sense of proportion and of symmetry, a true conception of conventional treatment, a happy compromise between nature and art, and a subtlety of detail and execution seldom equalled and never surpassed. The three hundred examples now before us—though in some instances not the best of their kind—prove that Russia in the decorative arts is heir to the Empire of the East. Her artisans through successive generations approach the Orientals, especially in the happy disposition of harmonious colour. In short, here in Vienna, Russia, standing as the most potent representative of Byzantium and of the Greek Church, has been, and in some measure still is, as greatly superior to Western Europe in the art of ornament as she is inferior in the treatment of the human figure. The collection here displayed, in common with many others, is for sale. The price asked is understood to be 3,000*l*; less might perhaps be taken. Any nation intent on forming a Museum of Historic Art would do well to enter into negotiations for the purchase.

Russia wisely makes known in Vienna the reproductions from her historic monuments; she also places on view books illustrative

of national ornament, and of the arts held sacred in the Russo-Greek Church. From Novgorod comes the celebrated Korsun or Khersonesus door of the Cathedral of St. Sophia. We incline to think, notwithstanding the name, that this art has nothing to do with Khersonesus; the style corresponds rather to that of the old bronze work found in Northern Germany. Indeed there is a tradition that this very door came from Magdeburg, and in support of its German origin we may quote the bronze doors we have recently seen in the Hildesheim Cathedral. The style and the date of the Hildesheim and of the Novgorod doors are not dissimilar; both are alike assigned to the tenth or eleventh century, which is also about the date of the old door of San Ranieri in the Duomo of Pisa. It so happens that the architectural styles of the cathedrals of Novgorod, of Hildesheim, and of Pisa are cognate; the stone-work, like the metal-work, shows an assimilation of Byzantine and Romanesque. There seems, in fact, but slight ground for the conjecture that the Novgorod doors are of Russian workmanship; they are, as we have shown, in all probability importations. This migration of the arts in Northern Europe is in many ways interesting; it corresponds naturally and almost of necessity with the migration of the peoples; the one in fact serves to illustrate the other. We have recently had the opportunity of tracing *in situ* in Germany works in bronze for ecclesiastical uses from the eleventh to the sixteenth century. This historic development is consecutive and complete, whereas in Russia the styles are either early or very late; thus the intermediate links are wanting. Russia has also sent to Vienna valuable reproductions of "architectural ornaments of the Cathedral of St. Demetrius in the ancient city of Vladimir." The date is the twelfth century; the style, which has been designated "Russo-Byzantine," may be compared to the Norman-Saracenic; the arches are stilted; the surface decorations embody animals, birds, &c. We have already pointed to recent architectural revivals in Russia and on the eastern frontier of Austria, which evidently are grounded on these and other like remains. In fact, as already remarked, the ancient Russo-Byzantine style, structurally as well as decoratively, affords the most legitimate basis for a national style. These invaluable reproductions have been secured for the "Germanisches Museum" at Nuremberg; no time should be lost in procuring duplicates for the South Kensington Museum.

Austria has certainly not impoverished any of her national collections in order to enrich her International Exhibition; the varied treasures scattered over Vienna remain, rightly, we think, untouched; and yet the Empire is not wanting in the rarest resources drawn from her great monasteries. The traveller who has tracked the course of the Danube over some hundreds of miles, who has sailed, for example, from Passau to Pesth, cannot fail to have been struck with the palatial monasteries which command the heights. The Rhine may be the region of feudal castles; the Danube, on the other hand, is the stronghold of convents. Klosterneuburg, Melk, Gran, and many others, stand as fortresses, as if planned as much for military as for monkish purposes; some of these richly endowed establishments are famous for their wine-cellar, while others are illustrious for their art treasures. The following are the chief establishments which serve to make, not so much in bulk as in rareness, an unexampled display in the Vienna Exhibition:—Klosterneuburg, the Bohemian Foundation of Strahow at Prague, the Upper Austrian Foundation at Lambach, the Presbytery of the parish church at Bruck in Styria, Kloster Putna, Szezewitz, and Dragomina, and the Cathedral Chapter at Ozerowitz, all in the province of Bukowina; the Cathedral Chapters of Tarnow and Salzburg, the Cathedral Church at Presburg, the Cathedral at Brünn in Moravia, and the Metropolitan Cathedral at Gran.

The large Augustino monastery of Klosterneuburg, one of the richest and oldest in Austria, contributes enamels, of which a remarkable triptych in *champlevé* is not surpassed in Europe. This *revoles*, consisting of a centre and two doors, is scarcely less than twenty feet in length. The plaques, fifty-one in number, are enclosed in an enamelled framework; the subjects are taken from the Old and New Testaments; the figures are gold—that is, the metal groundwork is left, and the surface of the figures has been graven with lines for draperies, &c., into which is rubbed the composition used in niello-work. The colouring of the enamelling is blue, red, and green; the addition of gold with dark niello details makes a rich and varied combination. We know of no work more imposing, whether for magnitude or magnificence. Its early date, too, together with its antecedent history, adds to its importance. The fabric is of the twelfth century, wrought by a certain Nicolas de Verdun; the style is that of the Rhine, as distinguished from the enamels of Limoges; a style identified with Romanesque movement, vigour, and rudeness, as compared with the more refined and debilitated manner of Byzantium. It appears that this rare product of the twelfth century was sent in the fourteenth century to a goldsmith in Vienna, to receive certain additions, and the alterations then made so nearly match the original work as to lead to the inference that Vienna possessed artisans who had inherited the old traditions. We have already had occasion to speak of Hungary as a land of enamels, and the treasures which the Austrian monasteries here turn out for exhibition prove, if not a distinct centre of production, at any rate a point of common meeting, where styles from the East and from the West, and possibly also from as far north as Central Russia, intermingled. The Vienna Exhibition is rich almost beyond precedent in enamels; China and Japan have never before been so fully represented.

The monasteries of Hungary exhibit art treasures which in

general character are naturally allied to the sacred works that come from sister institutions in Austria. Yet it is interesting to observe in the ecclesiastical products of this Eastern nationality that tendency to Orientalism which we have found in the arts of Hungary, even down to the present day. A chief contributor is the Archbishop of Gran, the seat of the Hungarian Primacy, at one time said to have been the richest in Europe. The noble church and monastery of Gran, standing within fortress walls in strong command of the Danube below, are, like the other ancient and opulent monastic establishments of the Empire, rich in church vestments, tapestries, and plate. The textile fabrics exhibited in Vienna approach the styles found in the Kremlin, especially as to the decorative use of pearls, and the embroidered relief given to the figures. Among such fabrics is conspicuous a composition comprising the Lamb, the emblems of the Passion, the figure of an angel, &c., all in high relief and enriched with pearls. From the same "Schatz Kammer" comes a rare piece of early metal-work with interlacing ornament allied to the Runic. We may here remark of these ecclesiastical collections generally that the anomalies of styles found on the frontier lands of Hungary, Turkey, and Russia, where the arts of diverse peoples meet and assimilate, become peculiarly perplexing. Chronologies are particularly difficult to determine because of the deceptive practice of reproducing at comparatively late periods early and archaic styles. This habit Austria has cherished in common with Russia, the Byzantine style in both nations being perniciously prolonged to perpetuity. But anything is preferable to the late Renaissance forms rampant in Western Europe. Some of the ecclesiastical products exhibited develop the decorative resource of Gothic design, but the works most strong in local character and colour are, as we have said, derived from Byzantine and Romanesque models. For the reason already given the antiquity of textile and other fabrics which come from Austrian, Hungarian, and Bohemian monasteries is not so great as would at first sight appear. Altogether these products present interesting problems.

Salzburg on the borders of the Austrian Tyrol, Brunn and Olmutz, chief towns of Moravia, and Prague, the capital of Bohemia, all contribute to their church treasures. Salzburg may be more distinguished for situation than for spiritual art, yet from her Domkirche comes a large and rich altar frontal nearly twelve feet long, bearing the Crucifixion and other sacred subjects; the actual date may be doubtful, but the style is that of the thirteenth or fourteenth century. Moravia is distinguished by the art riches of her parish churches. Two establishments in Prague contribute of their art substance to Vienna. From the finely situated and richly stored monastery of Strahow, which still holds in seclusion one of the greatest but least known pictures of Albert Dürer, comes early metal-work. And from the Cathedral of Prague, which is a veritable museum specially of antique embroidery, has been sent a unique collection comprising chalices, caskets, mitres, &c. Here again, in the enrichments of enamels, precious stones, and pearls, we seem to be on a boundary line between West and East, where the Latin Church seeks to clothe herself in Oriental splendour.

A word may be added, not only on the variety, but on the wide and equal diffusion, of these church treasures. Here in Vienna are collected illuminated MSS., ornate book-covers, church plate, some of which we might have gladly spared, not to mention again tapestries and enamels. And yet what strikes us most is scarcely so much this rich variety as the impartial distribution of the treasure over places high and low, reaching from the richest cathedral to the humblest church. It would seem as if Austria, at least since the time when Turkish invaders were driven back, had escaped that wholesale pillage which has stripped the sacred arts from less favoured territories. Certain it is that in Vienna there are to be seen precious relics of the past from lowly parishes whose whereabouts can hardly be ascertained by atlas or guide-book. It is a thousand pities that these rare remains, of which we would gladly learn more, have not been catalogued. And in taking leave of the Vienna Exhibition, from which we have reaped both enjoyment and instruction, we would venture to express the hope that these treasures of historic art will not be scattered till some record is made which may remain as a lasting memorial.

NEWMARKET SECOND OCTOBER MEETING.

THE Second October Meeting was a genuine success because its established fixtures were well supported, and gave rise to interesting contests. The customary features of a Newmarket race week, plates and selling sweepstakes, were hardly to be seen, and the more the compilers of the programme endeavoured to invent over-weight races the more they did not fill. Such being the case, and the tide having for the moment apparently turned against the trumpety events which at Newmarket have so long wearied all but the most inveterate gamblers, it was decidedly *mal à propos* for an influential member of the Jockey Club to seize this opportunity for denouncing the Middle Park Plate and threatening its abolition. The Middle Park Plate is not only the chief event of a Second October week—far more interesting and more important than the Cesarewitch—but also one of the best races of the whole season. If it were abolished, there would be no earthly excuse for allowing the Second October Meeting to drag over five

days. As it is, Monday's racing is quite superfluous, and the meeting might easily be got over in four days; but without the Middle Park Plate it could hardly extend over more than three. What the reasons can be which have led to this assault on a race that, from the day of its establishment, has added fresh lustre to the fame of Newmarket, it would seem at first sight difficult to say; but some light may perhaps be thrown on them at the meeting of the Jockey Club in the Houghton week, at which, it is understood, the matter is to be decided. The more important question of rescinding the prohibition of two-year-old racing before the 1st of May will be entertained at the same time; and by the action which the Jockey Club may think fit to take we shall be able to judge how far the Turf legislature is disposed or indisposed to advance or retard the progress of racing reform.

Monday's racing is, as we have said, a most undesirable superfluity, and never was it felt to be more unnecessary than last week. There was not a single event of more than passing interest, and only the Welter Handicap brought out a field of any considerable size. A good race between Bordeaux and Trombone—the latter conceding two years and 18 lbs.—resulted in the victory of the former by a head, which was not a very striking performance. There was a fine struggle between La Couronne and Polyhymnia, for one of the old-fashioned rich sweepstakes that used to be so common at Newmarket, and Fordham's masterly handling of M. Lefèvre's filly just landed her the winner. But, for the rest, the day's sport mainly consisted of walks over and uninteresting matches. But if Monday's racing was not worth the trouble of journeying to see, Tuesday's card was just as much overcrowded; and the Cesarewitch, being placed sixth on the list, did not come off till a comparatively late hour in the afternoon, when, in the failing light, it was difficult to distinguish colours. The ways of the authorities at Newmarket, however, are inscrutable, and it is useless to complain. The Clearwell Stakes brought out a good field, including Feu d'Amour—second to Napoleon III. for the Champagne—Polyhymnia, Glen Ahuond, Packington, Aquilo, and five more. A good race between three ended in favour of Feu d'Amour, who beat Aquilo by a neck, Polyhymnia being only a head from the second. The Heath Stakes—a new race, over the Ditch mile—fell to Delay, Hlenheim, good horse as he is, being unable to concede 3 st.; and then came the great event of the day. Never has the Cesarewitch been a greater success. The entry was unusually large; the acceptances were unusually numerous; the field has in numbers been surpassed four times, and in quality has never been approached. The thirty-four runners included such famous celebrities among the older horses as Winslow, Uhlán, Shannon, Corisande, and Lilian; while Marie Stuart stood alone among the three-year-olds both in eminence and in weight, the other competitors of the same age, such as Suleiman, Oxford Mixture, Pirate—winner of the Great Yorkshire Handicap—and Castalia, all carrying from one to two stone less. There was of course the usual admixture of professed handicap horses, with whose names we are familiar—with some of them wearisomely so. Flurry, Falkland, Indian Ocean, Napolitain, and Moorlands may be cited as representatives of this class; but King Lud could hardly have been included in it. So large a field of necessity included a certain amount of rubbish; but, taken altogether, it presented a striking contrast to the fields of average years. A noticeable feature also was the number of heavy weights that came to the post, Winslow, 9 st. 8 lbs., the top weight of the handicap, heading the list, which included Corisande, 8 st. 10 lbs., Uhlán, 8 st. 12 lbs., Shannon, 8 st. 8 lbs., Lilian, 8 st. 5 lbs., and Marie Stuart, 8 st. 5 lbs. The reproach so often levelled at Admiral Rous, that he handicaps all the top weights out of the Cesarewitch, might have seemed to be satisfactorily answered on this occasion, especially as Corisande, Uhlán, Shannon, and Marie Stuart were to the last prominent favourites. Yet the result most strikingly confirmed the justice of the complaint; for, despite their superior class, not one of the heavy weights finished among the first six. As a piece of handicapping, indeed, this year's Cesarewitch was a most signal failure, for it was a runaway affair for one horse, and thirty-three out of the thirty-four runners were left, from start to finish, hopelessly in the rear. For the first time in the history of the race a horse jumped off with the lead, made the whole of the running, was never headed, and won in a canter. King Lud was the hero of this unprecedented achievement; but, in justice to the handicapper, it must be said that, judging from his previous performances, no one would have thought of laying a very heavy burden on King Lud's back. As a two-year-old his best performance was running neck and neck with Queen's Messenger for the third place in the Two Thousand Guineas; and, as a three-year-old, he was well beaten in every race in which he took part. When he was bought at Lord Zetland's sale for 1,650 guineas, it was generally thought that Lord Lonsdale had made a very dear purchase; and though 7 st. 5 lbs. is no very great impost for a four-year-old, it was thought quite as much as King Lud on his merits required. Yet he won the Cesarewitch in such hollow fashion as to give more than usually good grounds for the repetition of the statement, so habitually made after an easily won race, that the winner had a stone in hand. This was no recovery of lost form, but an exhibition of unknown and unsuspected excellence; and all we can say is that King Lud during the short time he has been at Newmarket must have made the most extraordinary improvement ever witnessed in a racehorse. By his great speed he effectually stopped all the heavy weights, even before half the distance had been traversed; and then by his staying ability he was enabled to maintain his advantage at the trying hill at the finish, instead of

coming back to his horses and giving a chance to one or two of the light weights, which would have been accepted at once. So far from tiring at the end of the race, King Lud finished full of running, and the barren honours of places fell to Royal George and Pirate. Royal George, it will be remembered, won the Cesarewitch Trial Handicap at the First October Meeting, and Pirate won the principal Handicap at Doncaster. The second best in the race, however, was not Royal George, the second, but Fève, a stable companion, we believe, of King Lud, who was pulled up when the victory of the son of King Tom was certain. We have said that not one of the heavy weights finished in the first six; but it is fair to mention that Marie Stuart did not disgrace her high reputation. She occupied a prominent position as far as the Abingdon Bottom, where her heavy weight stopped her, and she was not further persevered with. But she may fairly be considered as having been fourth best in the race. The last event of the day, the Royal Stakes, was a *finis*; for Andred, after having beaten Chivalrous in a trot, was disqualified for not having carried a 5 lbs. penalty as the winner of the Newmarket Stakes. The mistake was annoying, for the stake is of some value, and Andred could have given the 5 lbs., or 10 lbs. for the matter of that, to Chivalrous with the greatest ease.

On the Middle Park Plate day—the really great day of the week—the card was just as ill arranged as on the Cesarewitch day. The Middle Park Plate was set down sixth on the card, and it was nearly four o'clock much too late on an October afternoon—before the large field of twenty left the hands of the starter. The withdrawal of *Écosais* deprived the race of much of its interest, while a glance at the gigantic Marsworth was sufficient to show that another year must pass before he will be fit to display his powers to advantage, if indeed his legs will stand the necessary work for another year. The two great stars of this year's two-year-olds being thus obscured, there was only Couronne de Fer left to represent the first class, and he had incurred the full penalty of 7 lbs., which has hitherto proved an effectual bar to winning this great race; Marsworth and Sir William Wallace had to carry the minor penalty of 4 lbs., and the remainder were uppenalized, the unfashionably bred Newry, the high bred Lepore—own brother to Pero Gomez—Dukedom, Gemme—half brother to Sterling—and two or three were taking the allowance for maidens; while the field also included Spectator, George Frederick, Tomahawk, Furnsfield, and Exilé—the latter being the representative of M. Lefèvre's powerful stake. Thus all the strength, such as it is, of the two-year-olds was brought into requisition with the exception of *Écosais*; and Newry, being currently reported to have won a trial with Napoleon III., became a very strong favourite, despite his wretched performance at York, where he made his first appearance in public. There was hardly any delay at the post, and the race was in some sort a *repetition* of the Cesarewitch; for as soon as the flag fell Newry took the lead, made the running at a great pace, was never headed, and won by a length. Unlike the Cesarewitch, however, there was a grand struggle in the Middle Park Plate for places, and indeed for the mastery; for though Newry was never actually headed, he was vigorously challenged at the final ascent on both sides, and was undoubtedly saved from defeat by the advantage he possessed in the weights. Briefly we may say that Newry had all his field beaten in the Abingdon Bottom except Couronne de Fer, Spectator, and Marsworth. These three simultaneously attacked him as they rose the hill, and Couronne de Fer as nearly as possible caught him. Giving way, however, in the last fifty yards, he allowed Newry, though hard pressed, to hold his own to the end; while the three pursuers all but ran a dead heat for second place. Oddly enough there had been a dead heat between three earlier in the day; but in the Middle Park Plate the judge awarded the second place to Spectator by a short head, while Marsworth and Couronne de Fer ran a dead heat for the third place. Neither the winner, who is by *Lacydes* out of *Blanchette*, or Spectator, is in the Derby; and, as ever, the third in the Middle Park Plate appears to be the most formidable candidate for Derby honours. Or rather the pair that could not be separated for the third place; though of the two, Couronne de Fer looks by far the more likely to train on. Four lengths from the dead-heaters George Frederick finished fifth, and Sir William Wallace sixth; but the former, as well as Lepore, will see a better day. The hero of the race was unquestionably Couronne de Fer, who would have won but for his penalty; yet some of the subsequent two-year-old running of the week would lead to an unfavourable impression of the general quality of the Middle Park Plate field. On the remainder of Wednesday's racing we need only remark that the non-staying Trombone beat Hochstapler at even weights so easily over the Rowley mile that the German horse must have lost all his form.

Thursday brought a very quiet day's sport. Laburnum, in the humour for once, won the Cambridgeshire Trial Handicap, giving lumps of weight away to all his seven opponents, with such ridiculous ease as to show that his owner and trainer have had ample reason for placing confidence in him, sadly as that confidence has been disappointed. Marie Stuart, little the worse for her exertions on the Tuesday, gave 7 lbs. to Silver Ring and Wild Myrtle, and bent them over the Two Middle miles. Silver Ring pressed her rather hard at the finish, but the St. Leger victress answered the calls made on her with the greatest gallantry, and won—all things considered—easily at last. Miss Toto, one of the best of M. Lefèvre's two-year-olds, cantered away with the Brethby Stakes, and Minister, another of his lengthy string, beat Victory

easily in the last race of the day. Victory, having been entered for the Prendergast Stakes, was disqualified from running in the race under notice; but by some strange negligence the mistake was not found out till after the race was over. The last day of the meeting furnished some remarkable surprises. A brilliant field ran for the Newmarket Derby, over the last mile and a half of the Beacon course, Kaiser and Doncaster being each penalized 7 lbs., and Boiard, Andred, and Trombone being their opponents. Doncaster could hardly be trusted so soon after his sorry exhibition at the First October Meeting; but, according to all public running, Boiard ought to have beaten Kaiser, who seemed to have no pretensions whatever to be able to give him weight. It was tit for tat, however; for, if the English horses were beaten in June after crossing the Channel to France, so now the French horse was summarily beaten on his visit to English soil. Briefly, Kaiser won by four lengths from Boiard, Andred was third, Trombone fourth, and Doncaster, as at the last Newmarket meeting, fifth and last. The Derby winner is done for, for the present at any rate; and possibly he may never recover from his desperate race in the Leger against his stable companion. Kaiser, whatever people may say of his swerving and faintheartedness at the finish, again did all that a good horse could be expected to do; for, if winning by four lengths from a Derby and a Grand Prix winner is not enough, what is? The Prendergast Stakes produced another magnificent race; four of the Middle Park Plate runners, Spectator, Sir William Wallace, Exilé, and Lynette taking part in it. M. Lefèvre was, however, represented by Fen d'Amour (with a 6 lbs. penalty for winning the Clearwell, Sir William Wallace being also penalized to a like extent) as well as by Exilé, and fortunate it was for him that he had two strings to his bow; for, after a splendid struggle between Spectator and Fen d'Amour, the judge was unable to separate them, and a dead-heat was hoisted on the telegraph. The first reflection that occurred to one after this race was that Fen d'Amour could very nearly have won the Middle Park Plate; for Newry, who was receiving 3 lbs. from Spectator, did not give him more than a 7 lbs. beating, if so much. The second was that the two-year-olds must be moderate, inasmuch as they cannot get out of the way of one another; and this, perhaps, is the true solution of the difficulty. Anyhow, M. Lefèvre holds the key of the position, and can tell to an ounce what his chance is against all the best two-year-olds. After this fine race came a very sorry one. The Middle Park Plate winner was brought out in a two-year-old handicap, and jugged quietly along—in very moderate company—in the rear ranks. A brilliant meeting wound up with a match across the flat between King Lud and Kingcraft, the latter conceding a stone for the two years difference in age. The Derby winner of 1870 could not, however, break the spell of ill-luck that has since attended him; and King Lud won so easily that he might well have been asked to give weight instead of receiving it.

REVIEWS.

MORRIS AND SKEAT'S SPECIMENS OF EARLY ENGLISH LITERATURE.*

THERE are some practical advantages to be gained by publishing a book backwards. By the time a man has finished his second volume, he is sure to find out a good many things which want altering in his first. If, then, he has courage to put forth the second volume first, and keep the first till afterwards, it will no doubt come out in a better form than if it had come out at the beginning. If he keeps the first volume in manuscript till after the appearance of the third, it will most likely be better still. This is what Dr. Morris and Mr. Skeat seem practically to be doing with the works before us. We have here, first of all in point of date, what is in truth, though not in form, a third volume—namely, Mr. Skeat's *Specimens of English Literature*. Then comes the joint work of Mr. Skeat and Dr. Morris, which is avowedly a second volume. Lastly, the first volume of their joint work still looms in the future. These two last are indeed only the second and first volumes of a second edition, while Mr. Skeat's separate volume is in form a distinct work with a distinct title-page. Still all the three hang together, and they come in the reversed order of which we speak. First comes the time from 1394 to 1579, then the part from 1298 to 1393, and lastly the time before 1298 has not come at all. No doubt, when it does come, it will be all the better for waiting. Dr. Morris and Mr. Skeat, by the simple process of having carried on their work to a later time, cannot fail to know more about the earlier time now than they did when they began. Of this increased knowledge we shall get the benefit whenever the first volume comes, but, as it has not come yet, we think that we may just as well say something about those parts which we have got without waiting any longer for it. To judge from

* *Specimens of Early English*. A new and revised Edition, with Introduction, Notes, and Glossarial Index. By the Rev. Richard Morris, LL.D., and the Rev. Walter W. Skeat, M.A. Part II. From Robert of Gloucester to Gower. A.D. 1298—A.D. 1393. Oxford: at the Clarendon Press. 1872.

Specimens of English Literature; from the "Ploughman's Creed" to the "Shepherd's Calendar." A.D. 1394—A.D. 1579. With Introduction, Notes, and Glossarial Index. By the Rev. Walter W. Skeat, M.A. Oxford: at the Clarendon Press. 1871.

the account of it given on a fly-leaf, it would seem to be undergoing a process of enlargement and improvement in every way. This first volume, when it comes, is to carry us back to the eleventh century. We shall not complain if, when Dr. Morris and Mr. Skeat have done this, they should wind up by giving us yet another volume before the first, for the times before the eleventh century. We have had a great deal published of our earliest English, both in the way of whole works and of selections; still we think that there is quite room for something of the kind treated in the way in which it would be sure to be treated by the present editors.

It is perhaps a natural result of this process of what we are tempted to call "progression by antagonism" that, attached to what we must be allowed to call the third volume—that is, Mr. Skeat's *Specimens of English Literature*—we have an Introduction, part of which would be quite in place at the very beginning of the whole thing. The general hints with which Mr. Skeat ends that Introduction have no special reference to the times between 1394 and 1579. They bear on the study of the English language at any date, and some of them on the study, not only of English, but of any language. Mr. Skeat has fully committed himself to the cause of showing that English is English, and nothing else. "The changes in the language," he tells us, "between the reigns of Ælfred and Victoria have been gradual, not violent, and our present speech differs from the oldest English (generally called 'Anglo-Saxon') chiefly by reason of the alterations which a long lapse of time naturally and imperceptibly introduces." Further on in his introduction comes a paragraph of much practical value:—

A real insight into English grammar can more easily be obtained by a week's study of Vernor's Anglo-Saxon Grammar, or some similar book, than by years spent in reading treatises which ignore the older forms of the language. Many students lose much solid advantage, and a sure basis on which to rest their grammatical knowledge, through an ill-judged anxiety to avoid the much-dreaded "Anglo-Saxon," the awe of which soon disappears, and is exchanged for interest, when once it is patiently encountered. The whole of English grammar is formed upon the Anglo-Saxon grammar as a basis. A knowledge of Latin grammar is sometimes a direct hindrance, as it is apt to make the student imagine that he has the key to idiomatic constructions, when he is all the while explaining them wrongly.

We ought to notice that Mr. Skeat tells us in a note that Dr. Morris's *Historical Outlines of English Accidence* is now in the press, which reminds us that his own work was published in 1871. Then he goes on to remind us of various facts in the history of our language which people are beginning to understand, though they still cannot be too often repeated for the benefit of both teachers and learners. Thus, for instance, he reminds us that "by far the greatest quantity of words introduced into English from the French were introduced in the fourteenth century." This is perfectly true, though a great many came in before and a great many have come in since. But we may perhaps make this distinction between those which came in then and those which came in before, that the earlier ones came in—each one for some particular reason—as the name of something which, either in itself or in its particular shape, was looked on as foreign, and which therefore kept its foreign name as a kind of technical term; while the later infusion of French which followed naturally on the adoption of English as the universal tongue of all classes, when those classes who had hitherto been more familiar with French began to speak only English, could hardly fail to bring many French words with them into English. Mr. Skeat here notes that for the French element in English we must look to Old-French and not to modern French, and of course the study of Old-French involves the study of the process by which French was formed out of Latin. But has not Mr. Skeat made a slip when he speaks of "French words derived from Latin"? There is of course a class of French words which are, strictly speaking, "derived from Latin"; but it is not these of which Mr. Skeat is now speaking. He is speaking, not of words consciously brought in from the Latin at a late stage of the French language, but of words which have gone through that process of change by which the French language itself was formed. Such words cannot be said to be derived from the Latin; they are the Latin words themselves. We are led to make this remark by Mr. Skeat's own caution against the misuse of the word *derived*, as when people talk of words being "derived" from Sanskrit, Latin, or any other Aryan tongue, when what is meant is that they are *cognate* with words in those tongues. But a man is no more derived from himself than he is derived from his brother or uncle. Neither the French *cheval* nor the Bret-Welsh *ceyl* is derived from the Latin *caballus*; the Bret-Welsh word is cognate with *caballus*, while the French word is *caballus* itself. But when a Frenchman talks about "equitation," the word is distinctly derived, consciously formed from *equus*, *equus*, *equitare*, *equitatio*, from a class of words which have left next to no traces in the genuine French vocabulary. Mr. Skeat also points out how some words, like *wise* and *guise*, have a double form in modern English—the natural English form and another which has come to us from the French, but which is itself part of the Teutonic infusion into French. On such cases Mr. Skeat says that "it might almost be said that the latter [form] is borrowed by the English language, through the medium of the French, from itself." The only objection to so saying is that historically these words came into the Romance of Gaul, not from the English, but from the Frankish, form of Teutonic.

The following remarks of Mr. Skeat are most important:—

The true dignity and originality of our own language seem to be very little understood and appreciated. An Englishman learning a little German soon

begins to think that a good many English words appear to be "derived" from the German. Accustomed to despise his own language, he seems to forget that there is at least an equal chance of the German being "derived" from the English. As a matter of fact, the languages are cognate or allied, and neither language has really borrowed much from the other. But it deserves to be remembered, that the oldest Teutonic remains are in Low German, not in High German; that the English epic poem of "Beowulf" is older than anything extant in High German; and that English ranks above German in the tables of letter-changes indicated in "Griffith's Law." It follows from this, that to look upon German, so to speak, as a subordinate form of English, is, although an error, an error of less magnitude than the unphilological and unpatriotic one of looking upon English as a subordinate form of German. German scholars are aware of this. It is reserved for Englishmen to be unaware, as a rule, of the dignity and importance of their own magnificent language.

The confusions against which Mr. Skeat has to fight come largely from the unlucky nomenclature which leads Englishmen to fancy that they have really no independent language at all, but only a jumble put together in the thirteenth or fourteenth century. Then again the somewhat ambiguous use of the word *Deutsch* leads many people to fancy—often unconsciously—that modern High-Dutch is the one original Teutonic speech, instead of being merely one form of it out of many, and that a form, as Mr. Skeat shows, certainly not more ancient than our own. Some people may remember the rivalry of Messrs. Pike and Nicholas, and the notable attempts to prove that Englishmen are Welshmen because of the shape of some High-German's hat and of the difference of his tastes from those of some Englishman. Their one notion of Teutonic was modern High-Dutch; and, as Englishmen are certainly not that, they could not understand how Englishmen could be Teutonic at all. All this is just the same kind of confusion against which Mr. Skeat bears testimony.

Dr. Morris's Introduction is mainly a comparative grammar of the three chief forms of English at the stage to which his selections belong. One thing at once strikes us—how much more of inflexion the Southern, the strictly Saxon, dialect kept than the Midland and Northern tongues. But has not Dr. Morris been somewhat influenced by a geography a little too late for his purpose, when he places the boundary of the Southern dialect at the Thames? Or rather he directly after contradicts or corrects himself. He first says, "The Thames formed the Southern boundary of this region," that of the Midland dialect; and then says that the Southern dialect is spoken, besides the counties south of the Thames, "in Gloucestershire and portions of Herefordshire and Worcestershire." We should have thought that the Southern dialect ought to take in a still larger part of the lands north of the Thames; but, as it is, here is a very important admission of the existence of the Saxon speech far beyond the bounds of the later Wessex. We get so accustomed to the Wessex of Eggeberht, stretching as far to the West as it could go, but not stretching to the North at all, that we forget that the early West-Saxon conquests pushed more northwards than westwards, that at one time there was as much West-Saxon territory north of the Thames as south of it, that the West-Saxon conquerors aimed—though unsuccessfully—at Deva long before they aimed at Isca. When Dr. Morris finds the Southern or Saxon tongue spoken in a considerable district north of the Thames, this is an abiding vestige of this state of things. The northern dominion of the West-Saxon Kings came politically to an end in the eighth century; but the Saxon settlements of Cædwallin's day have left their stamp on local speech till now.

We have talked much more about the Introductions of Mr. Skeat and Dr. Morris than about the other parts of their books. They are both of them fellow-workers with ourselves in a common struggle against a particular form of error. As engaged in such a struggle, we think it our business to put on record every case that we come across where any ground is either gained or lost. Now the publication of such an Introduction as Mr. Skeat's is distinctly ground gained. Several important truths are put forth with singular force and clearness. Of the more purely editorial part of the volumes there is really no need to say more than that they are Dr. Morris's and Mr. Skeat's. Meanwhile we look forward to Dr. Morris's recasting of his first volume, and to the still earlier volume which must some day come before that.

HENRY FOTHERGILL CHORLEY.*

THE life of which these volumes give an account, though not in itself a very eventful, nor, according to the ordinary estimate of human affairs, a very happy one, was at least fortunate in the singular interest of its literary and artistic surroundings; an interest, too, which to a great extent was not the result of any chance, but came as a proper reward for the faithful performance of the troublesome and too often thankless functions of criticism, to which the best part of Mr. Chorley's life was devoted. The freedom he used in the exercise of his profession procured him some enemies, and a good many hard words; but the sincerity and readiness to perceive real excellence which were coupled with this freedom led in many instances to friendly relations, whose value infinitely outweighed all the resentment and abuse that had to be endured from pettier natures. A critic whose professional career bore fruit in intimacy with such persons as Mendelssohn, Moscheles, and Madame Viardot in the sphere of music, and

* Henry Fothergill Chorley; *Autobiography, Memoir, and Letters*. Compiled by Henry G. Hewlitt. 2 vols. London: Richard Bentley & Son. 1873.

with Dickens, Hawthorne, and the Brownings in the sphere of letters, must be considered to have been uncommonly successful in overcoming the difficulties of his art. The biographer who now writes of Mr. Chorley in a strain of enthusiastic attachment was himself led to seek his acquaintance in consequence of a work of his own being reviewed by Mr. Chorley with "mingled severity and sympathy." We are indeed led to doubt whether the regrets for an incomplete life and an unsatisfied vocation which seem to have frequently embittered Mr. Chorley's thoughts had very much foundation in reality. It may be that, if his aptitude for music had been cultivated in due time, instead of being barely tolerated, his name would have been added to the list—a list which certainly has ample room for additions—of eminent English composers. But this is, after all, matter of conjecture, though Mr. Chorley's own feeling on the subject was strong, and the occupation of a critic is not necessarily less honourable than that of a producer. At any rate we are more in need of really good criticism than of indifferently good production. Nor can the fates be accused of assigning an unworthy part to one who so uses the station to which they have led him as to be respected, not only in his own country, but beyond it, by those whose respect is most worth having. Certain it is, however, whether we choose to ascribe it chiefly to natural temperament or external circumstances, that a sense of hindrance and disappointment did weigh upon Mr. Chorley through life, as appears from the journals and unfinished autobiography from which his literary executor has given considerable fragments.

The condition in which these materials were left has put the biographer at some disadvantage in point of form. They were too incomplete to stand by themselves, yet too copious and characteristic to be merely broken up and recast; and the result is a kind of cento in which the author, or compiler, appears sometimes as narrator, sometimes as editor, and in which an appearance of desultoriness and confusion was in some degree unavoidable.

We are first introduced to Henry Fothergill Chorley as a child in a North-country household scarcely emancipated from the strictness of the old Quaker ways, most of whose members appear to have been in different ways persons of some mark. One anecdote of an aunt of Mr. Chorley's in her young days argues a considerable vein of mother-wit in the family. She was at a country house where a party of guests came unexpectedly to dinner:—

The hostess went hither and thither in despair. Somehow or other the material of the entertainment was got together, or represented, one thing only wanting—the dessert. Nothing was to be found save a basket of hard, green pears, set aside for baking. For better for worse, however, by the whimsical girl's counsel, they were presented. When she saw them coming, she cleared her throat, and in an audible voice said to her hostess, at the head of the table, "Are not those the famous Cleopatra pears?" She used drily to add, in later years, when, mocking at herself, she told this anecdote, "My dears, after that no one thought of refusing them. The dish was cleared."

Then we have a rather sad account of an education in which the disciple and the masters were at cross purposes, and in which he learnt very little except that which he was not taught. With some occasional aid from friends, he picked up the elements of music in a curious irregular way during his schoolboy years; and the time spent by him later in a merchant's office in Liverpool was useless except so far as it gave him opportunities of extending his favourite knowledge by attending and taking part in musical performances. Early in 1834 he was established in London on the staff of the *Athenæum*. This was the beginning of more than thirty years' activity in the calling thus definitely chosen, through which Mr. Chorley was brought into relation with most of the persons eminent in literature and society during a period of no ordinary brilliancy. It is difficult to choose even from the reminiscences, probably themselves only a selection, which Mr. Hewlett has preserved. In some places the reticence due to living persons has an unfavourable effect on the literary value of the work; but this is a drawback which we must be prepared for, as the only alternative for more serious ones, so long as it continues to be the fashion to publish men's biographies almost before they are buried.

Perhaps the most complete and interesting episode in these memoirs is Mr. Chorley's friendship with Mendelssohn. They first met in 1839; but the musician seems to have already known so much of the critic's work that the usual preliminary stages of acquaintance were dispensed with, or very much shortened. Within a very short time we find letters from Mendelssohn to Mr. Chorley, written in a perfectly intimate and familiar tone. Mendelssohn's English, although he apologizes for it, is generally quite correct in form, and has only slight German turns of phraseology which are rather pleasant than otherwise. As might be expected, the letters are chiefly concerned with music, and there are several allusions to incomplete designs of Mendelssohn's which he had previously discussed in conversation with Mr. Chorley. In one place there are some curious remarks on the difficulties likely to attend the establishment of an academy for singing in England:—

The only drawback seems to me the difficulty for English ladies of moving alone (without servants, gentlemen, and other accompaniments *obligato*), which, however, is almost indispensable for such an undertaking; and (unless it is to be confined only to the inferior classes) I do not know how this obstacle in England, as well as in France, may be overcome. And then the second, that men of business should consider music, and the participating of it, as something *not* below their dignity, and that they should have indeed their hands free enough to count the pauses and the sharps and flats. With us, who shut up from twelve to two, as you know, and who have done in shops and counting-houses at seven, the thing is quite different; and then all our girls run about the streets by themselves the whole day

long; and then at night, if there are three or four of them, and an old spinster in the rear, they will roam and fear nothing; or the singing gentlemen will take them home, at which idea every Frenchman's morals would go into violent fits. [The formation overcomes in this extract is an all but solitary grammatical slip.]

Elsewhere Mendelssohn expresses surprise at Mr. Chorley's "extraordinary memory" for music which he had only heard once; and we may observe that, in another published letter of Mendelssohn's, not referred to in these memoirs, recommending Herr Joachim, then a boy of thirteen, to the good offices of a friend on the occasion of his first visit to London, Mr. Chorley is mentioned as one of the persons to whom he should be introduced. The correspondents met again in 1847 for the last time, and indeed in Mendelssohn's last days, at Interlaken. This friendship seems to have been one of the most deep and genuine in Mr. Chorley's life, and the loss was proportionately a severe one.

Besides that which is directly connected with music and literature, there is a considerable stock of social reminiscence and anecdote at which we can only glance. The figures of D'Ossay, Lady Blessington, and Sydney Smith come before us in rapid succession. One good thing of Lady Blessington's set down by Mr. Chorley is very perfect. On an occasion when Landor, being in company with an Ultramontane advocate of Christian art, thought fit to attack the Psalms (whether from an artistic or an ethical point of view does not appear), Lady Blessington came to the rescue thus—"Do write something better, Mr. Landor!" Nor are the lights of a graver society unrepresented; we find notices of George Grote and Mrs. Somerville. The impression made by Mr. Grote's personal qualities on Mr. Chorley was so remarkable that it is worth while to give some part of his estimate in his own words:—

Four men that I have known, the late Duc de Gramont, the Duke of Ossuna, the late Duke of Beaufort, and Mr. Grote, in their high breeding and deference to women, in their instinctive avoidance of any topic or expression which could possibly give pain, recur to me as unparagoned. But the three men first named had little beyond their manner by way of charming or influencing society. Mr. Grote, as a man holding those most advanced ideas which were at war with every aristocratic tradition and institution, a man with vigorous purposes, and ample and various stores of thought, might well have been allowed to dispense with form, and smoothness, and ceremony. But he showed how these could be combined with the most utter sincerity. If, at times, he was elaborate in conversation, with little humour of expression, though not without a sense of it in others, he was never overweening. He stands in a place of his own, among all the superior men to whom I have ever looked up.

We are also informed that Mr. Chorley made several noteworthy acquaintances during his visits to Paris in 1836-39, of which he kept "minutely detailed journals"; but his biographer has chosen, whether because the interest of the journals is not in proportion to their bulk, or for any other reason, to assign a comparatively small space to these experiences. There are three or four amusing pages about Paul de Kock, but the notice of Alfred de Vigny, one of the most interesting figures in modern French literature, of whom there surely must have been much to say, is singularly meagre and disappointing. Some notes of an interview with Chopin (for which we have to look in another chapter, in consequence of Mr. Hewlett's plan of keeping the social and musical departments of his history separate) appear also to be cut too short, nothing being given but a piece of technical criticism on the composer's playing.

Later in his life Mr. Chorley was to some extent involved in the table-turning controversy, the delusions of clairvoyance and spiritualism having made some way among his friends. It fared with him as it generally does with unbelievers. He attended a *séance*, but insisted on having lights on the floor and on sitting under the table; after the lapse of half-an-hour, during which nothing happened, he was told that there could be no experiments where an infidel spirit prevailed. He also tested the powers of the professional clairvoyant Alexis, and the incident is as instructive as any of the kind we remember to have seen recorded:—

When one Alexis was here, who was guaranteed to read everything, no matter how far off, however hermetically sealed up, a friend of mine called on his way to a *séance*—no willing co-juggler with Alexis, I am persuaded, but leaning towards his marvels. He was anxious that I should hear him company. I declined, on the argument I have stated. "Well," said he, "what would satisfy you?" Said I, "Supposing I were to write an odd word—such a one as 'orchestra'—and seal it, and satisfy myself that no one could read it without breaking the seal, and be equally satisfied that no one would mention it who was honestly disposed?"—"Well?" "Well, then, if it was read, I should say the guess was a good one—nothing more." "Let us try."

Accordingly Mr. Chorley wrote down, not *orchestra*, but *Pondicherry*—sealed the paper, and gave it to his friend. The friend came back, and reported that Alexis had indeed read the paper at once, but had read *orchestra*. Mr. Chorley's inference was the natural one, that the believing friend—who for his own part only "took the performance as a brilliant illustration of *thought-reading*"—had somehow let out the word actually communicated to him.

Another interesting feature of this book is a short memoir from Mr. Chorley's own hand of his brother John, one of those rare persons whose genius leads them to excellence in an unexpected and seemingly incongruous special subject. He was originally intended, like Henry, for a commercial situation; he was the first secretary of the Grand Junction Railway from Liverpool to Birmingham, a post which he retained for a considerable time; he was once in Spain on business for about three months; and somehow he knew more about the Spanish drama and Lope de Vega than any other man in Europe. The only case of an eccentric

aptitude for languages at all parallel to this which we can call to mind is that of an eminent English Orientalist now living, which Cambridge readers will easily recognize. John Chorley, at any rate, did not fail to find a speciality, though it may seem a minute one which he made entirely his own; happier in this respect than his brother the critic, who seems to have been always lamenting that he was prevented from giving himself wholly to music.

As to Mr. Chorley's own work in literature and criticism, we learn to know it in these volumes chiefly through the impression which it made on others when it was new. Several of the letters here printed, and those from correspondents of no small eminence, relate to it. Mr. Chorley's reputation as a critic was, indeed, too well established to need any additional testimony, and the merits of his work went far beyond the mere readiness which may carry a review article safely through the period of the current number. On the one hand, he was prompt in rendering honour to Hawthorne, to Mrs. Browning and her husband, and to M. Gounod, long before their names were known to the public as they now are; on the other hand, he had no respect for popular idols, and protested against the extravagance of Mr. Ruskin's dogmatism, when Mr. Ruskin's infallibility was still commonly believed in. As an original producer he was less successful with the world; neither his plays nor his novels ever fairly laid hold of the public taste; nevertheless the biographer has devoted ten pages to the analysis of a single play, and eight to that of a single novel, with a zeal which we cannot but think somewhat misplaced. A piece which failed to please when it was presented at large can hardly be revived into fame by printing an elaborate argument of it. However, it is to be observed about these works that they did command the serious attention and approbation of such men as Dickens, Hawthorne, and Mr. Browning; the slight favour they met with in the market was probably due to technical imperfections, disguising their real worth except from the sympathetic insight of an artist. The original compositions of Mr. Chorley which were best received were his occasional verses and words to music, a kind of writing which, though lighter than tragedies and romances, is not so much easier as people suppose. Some of Mr. Chorley's lines reprinted in this book are quite felicitous enough to deserve a place in some future English anthology.

We have intimated that the manner in which these memoirs are put together is not altogether satisfactory, and the result is rather a book with interesting things in it than an interesting book. Still any addition to our knowledge of human nature in the particular as well as in the general is something to be thankful for, and there is a good deal of miscellaneous human nature in these volumes of autobiography and anecdote.

PRUSSIAN OFFICIAL HISTORY OF THE WAR.—PART IV.*

(Second Notice.)

THERE is much in this new Part of the Official History which seems to form an appropriate preface just now to the study of the legal proceedings that have commenced at Versailles. It is true that various French writers on the affairs of the Army of the Rhine have revealed more or less of the change of strategic counsels which preluded Bazaine's final nomination to the chief command; but the whole thread of this part of the story of Metz had never been clearly put together, nor the motives which caused so much vacillation thoroughly traced out, until the Berlin writer took the work in hand. Of course he has had the advantage of the large resources with which the literary controversy that should now be hushed in the presence of the tribunal of the Tribunal had abundantly furnished the historian. For there are few of the many writers who have made it their business to attack or defend Bazaine or his master that have not touched, as a matter of course, on the intermediate period of doubt which elapsed between the defeats of Woerth and Spicheren and the final attempt to retreat from the Moselle. There is no part of the Official History yet published more carefully done, or more pregnant with the results of sound work, than the review given by this writer of French affairs after the two defeats of the 6th of August.

There can be no doubt that the Emperor's apology tells the truth when it says plainly that the fine scheme of an invasion of Southern Germany melted away before the difficulties which imperfect organization had raised up. The Report of the Pasquier Committee, recently reviewed in these pages, has more than one picture in it drawn by eyewitnesses of the helpless state in which Marshal Leboeuf found himself when once the gigantic task which from his office desk at Paris had seemed so easy, of "throwing a quarter of a million men over the Rhine," had really to be faced. No administrator's incompetence has ever been more ruthlessly exposed than that of the man who, when visiting Strasbourg during the first alarm in July, tried to browbeat and reprove the local Intendant for not having purchased on his own responsibility the stores the absence of which had been in vain again and again reported to Paris as fatal to efficiency. The fact here seems to be that French rulers during the latter part of the Second Empire showed the singular unwisdom of going to the expense and trouble of maintaining an immense force, intended to appear actually ready for war, but which, partly from the over-centralized system of administration, that carried everything up to the Minis-

terial table at Paris, and partly from the economy enforced upon the Intendance in the hope of balancing the expenditure of the large number of men with the colours, was in truth utterly unprepared. The French system was actually, as regards the use for the field of the number thus already on the lists, far behind the cheap German plan, with its reserve men scattered all over their native provinces. So that the very first discovery the unhappy Emperor made was that which his pamphlet revealed—that he had for years been making France pay the price of a supposed superior readiness, which the coming of the shock at once showed to lie not on her side, but on that of the enemy.

These considerations may serve as a preface to what the Berlin writer says in approaching the question of the Moselle strategy:—"At the Emperor's headquarters in the first days of August, all plans of attack had been given up, and attention turned entirely to the defence of his own country." So rapidly had the mythic notion of a sudden passage of the Rhine, like his uncle's masterpiece of 1805, melted away before the realities of the situation. But the first notion of defence, which was to unite the wing under MacMahon to the main army by calling both back to the Moselle, vanished as swiftly when the terrible news of Woerth and Spicheren came in. "It was necessary"—in the brief but plain words of the German writer—"to seek the junction further west, or to give it up altogether." The most immediate need was that of bringing together the army of Bazaine (the IInd, IIIrd, and IVth Corps) had been put nominally under the Marshal on the 5th of August) at once by a rearward movement. To do this on the Moselle fortresses was perfectly natural, as the Moltke narrative points out. But, on the other hand, on the morning of the 7th when the decision had to be made, there was absolutely no news at the Imperial headquarters of Frossard's routed corps; Canrobert's reserve had barely begun to be transported forward from Châlons; and it needed no reflection to show the French staff that, with MacMahon in full flight, there was nothing that could stop the large army which had routed him from advancing straight to the Upper Moselle, and so turning any line taken up by the Emperor lower down. At this early stage of affairs, therefore, it is not to be wondered that the impulse of the moment was to withdraw the whole of the forces on Châlons; and the necessary orders for carrying this out were issued. By the 8th the temporary command of Bazaine, including Frossard, who had reached Sarreguemines after his defeat only to retreat through it, was already approaching Metz, as well as the Guards, the intention then being to cross the Moselle westward at once.

Then, however, came fresh changes in Napoleon's counsels. The thought of Paris learning that half the country up to her walls had been surrendered by the army at the first touch of the enemy; the fear of the strength which the Opposition in the Chambers would instantly gain from the alarm; the general influence which in France, more than in any other country (according to the official writer, whose opinion will be much disputed here), public opinion exercises on the acts of the Government, caused the Emperor and his advisers to tremble at the possibilities which their design opened up, and to shrink from facing what were in fact the military necessities of their situation. Fresh consultations followed. It was presently resolved to arrest the movement of retreat, and face the coming foe on the east side of Metz; and orders were issued accordingly to the three nearest Corps at once, and on the 10th to Frossard; Canrobert being directed to resume his original advance forward from Châlons to the Moselle with the Sixth. With the reserve cavalry, which were ordered in from Nancy, it was estimated that 200,000 men might be gathered for the shock. The Germans, too, seemed to the French staff to be halting, as though hesitating to commit themselves into Lorraine; and it was even hoped that there might yet be time to bring up the additional reserves which were already coming into Châlons as Canrobert's command left it.

In truth, as is here well pointed out, the very superiority of numbers which the German staff wielded made their strategy at this point seem slow. The enormous masses of men which formed the First and Second Armies needed several days to bring them up into any sort of line. A delay of the left of the latter, it may be added, must have been caused by Moltke's vain attempt, noticed last week, to intercept MacMahon; and the subsequent orders for the advance, then quoted by us, show how slowly the German right and centre had to move in order not to get out of place. Now indeed would have been the opportunity for the French staff, had they confidence and wit enough, to engage part of the enemy separately by a bold forward movement. But the dull, waiting defensive which their want of confidence in themselves and in their troops led them to adopt from the 8th to the 12th of August played directly into their great adversary's hands. It gave him full time, well covered by the screen of bold patrols which his cavalry divisions had thrown out, to carry out deliberately and completely the preparations necessary for crossing the Moselle beyond the French right before they could discover that they were being turned. Meanwhile the latter stood passive and almost motionless, the IIIrd Corps in advance towards Courcelles, with the IVth and IInd to its left and right flanks, and the Guard in rear, whilst the VIth was arriving in fragments. And the Germans, soon learning by their patrols the general movement into this position, took it to be probable that it was preparatory to the concentrated advance which seemed the natural strategy of their adversary. They could hardly know how low the conception of the Imperial staff had sunk under its present leadership. It was evidently under such an expectation of an attack that the Royal

* Der deutsch-französische Krieg von 1870-71. Redigirt von der kriegsgeschichtlichen Abtheilung des grossen Generalstabes. Erster Theil, Heft 4. Mittler: Berlin.

orders of the evening of the 11th were headed, "It is not unlikely that a considerable part of the enemy stands before Metz on the left bank of the Nied. A closer junction of the First and Second Armies is therefore necessary; and His Majesty has directed as follows." Then follow full directions for the concentration. Twenty-four hours later the nervous feeling which had dictated these precautions had vanished from Moltke's mind. Tidings from all the patrols—and pages of the narrative are here devoted to chronicling their venturesome activity—came in to the Royal headquarters at St. Avoird, that the French showed no signs of advance, but rather the contrary, and the orders of that evening at once chronicled the fact, and the decision taken instantly upon it. We abbreviate them somewhat:—

So far as can be judged from the news brought in, the main body of the enemy is in retreat over the Moselle through Metz. The First Army will advance upon the Nied, push its cavalry near Metz, and across the Moselle below, and cover the right flank of the Second. This will march on the line between Buchy and Château Salins, push its advance posts to the Seille, and seek to secure the Moselle passages about Pont-à-Mousson, sending cavalry over the river to reconnoitre. The Third Army will continue its march on the line between Thionville and Nancy.

Thus began the mighty sweeping movement which was to result in the greatest capture ever made in war. On the 13th the Royal headquarters, following the general direction, went forward from St. Avoird, which lies forty miles due east of Metz, to Herry, a point some twenty-five miles south-east of the fortress. But the presence of a formidable part of the French force still visible outside the forts once again impressed Count Moltke with the possibility of a counter-stroke from the enemy by a sudden attack on the First Army whilst it stood covering the movement of the Second; and so two of the seven Corps which made up the former were checked in their march on the 14th, and held ready south of the city to support Steinmetz should he be seriously pressed by such an advance. Not too great a precaution, thinks the German writer; for on this day the French, still clinging to their position whilst the head of the invading army got past it to the Moselle, seemed aiming at more than a rearguard demonstration. But in truth their attitude, if Bazaine did not seriously desire a fight, was altogether a mistaken one; for it led direct to the battle of Borny, or Colombey-Neuilly, so called from the line held by the Germans.

To go back to the 9th of August, the French had hardly taken up the position already described east of Metz behind the Nied, when it was condemned for its tactical disadvantages. The wooded country close to the stream on the other side would completely hide from any view an enemy advancing from the east. So the order was given to draw the whole of the force back nearer to the fortress, where it stood visible to its foes, and yet in utter unconsciousness of what the Germans were doing, the French cavalry rarely venturing outside the line of infantry outposts, and never beyond the Nied. On the 12th the Emperor, possibly wearied out with his own indecision, resolved to resign the command absolutely into the hands of Bazaine—a measure evidently contemplated several days before. The picture of the unhappy monarch and his wretched plight, afraid to face Paris without victory, and clinging almost hopelessly to the army on which he was a clog, has nowhere been more powerfully touched. To put the thoughts of the Berlin writer very briefly; no sovereign should be present with an army in the field, save when he is able personally to conduct it, and takes the whole responsibility of so doing.

Every intelligent man in the French army had probably by this time become aware of the danger of keeping it motionless where it was. It is not surprising, therefore (says the narrative), that, after much wavering, the Emperor, in giving over his charge to Bazaine, added the injunction to retreat at once at least to Verdun, nor that the Marshal issued orders for the march on the evening of the 13th, when he had actually taken up his command. But it was precisely at this time that the German troops of the First Army, which had hitherto by their slow movement left a belt filled only by cavalry between them and their adversary, at length touched his outposts, in accordance with their order of the evening before, closely at every point; and a collision might therefore at any moment be brought on. The German Second Army moved on as already described. Meanwhile the 13th was spent on the French side in throwing bridges and sending over cavalry and trains; and the 14th was well advanced when the IInd, IVth, and VIth Corps had begun fairly to follow, covered by the IIIrd and the Guard.

Sudden cannon-firing interrupted the rearward movement about four o'clock in the afternoon. Manteuffel, whose corps formed the right of the First Army, reconnoitring in person from the front of his lines, had observed what was going on. So also had General Moltke, who was near him to his left with the advanced brigade of the VIIth. A few words of hurried communication led to the resolve of both to attack. Were the enemy in real retreat, or only passing through the fortress to fall on the Second Army, it must, the generals thought, be the duty of the First to delay him. So reasoned Manteuffel, and forthwith began the battle. Its first sounds stopped the French westward movement. Its increasing heat brought division after division back towards the scene of action. It is admirably told in this narrative, but is dealt with essentially from the German side; whilst it is admitted that its opening was "improvvised" and dependent rather on the high spirit of the Germans than on the necessities of their situation. And the technical details, interesting though they are, and made specially

instructive by the other key-strokes which are a special feature of the work, fade into insignificance when the reader's mind turns to the greater problem of strategy involved. The Part before us is closed, and we are yet left face to face with the question—What general or council of generals, what circumstance or combination of circumstances, must bear the heavy responsibility which brought the French back over their bridges on that fatal August afternoon? But such questions as this have passed out of the domain of literature into that of justice, and we must leave its settlement in the hands of the court before which the chief actor in the scenes of that eventful period has been arraigned.

ANOTHER "PEARL OF THE ANTILLES."

WE recently reviewed a book by Mr. Gallenga called *The Pearl of the Antilles*. We have now before us a book of the same name by Mr. Walter Goodman. We are sorry to see, from a notice issued with Mr. Goodman's book, that some dispute exists between the publishers of the two volumes as to the right to the title. It is not for us to decide whether Messrs. King or Messrs. Chapman and Hall have the best of the argument; whether such a name as the "Pearl of the Antilles" can be the subject of a legal right; or whether, under any circumstances, it can be worth while to dispute such a question. The misunderstanding is unfortunate, and the more so because Mr. Goodman reminds us in his preface that there is a long series of endearing titles which "poets and others" have conferred upon the island of Cuba; such, for example, as the "Queen of the Antilles," the "Jewel in the Spanish Crown," the "Summer Isle of Eden," the "Garden of the West," and the "Loyal and Ever-Faithful Isle." Some of these we fancy we have heard before, as applied to different countries; but, as there was so wide a choice, it is a pity that Mr. Goodman and Mr. Gallenga should have pitched upon the same title. We cannot help suggesting, moreover, that a still better and more obvious title than any of them existed—namely, "Cuba." The title of a book ought, simple-minded readers are apt to think, to be an indication of its contents; and the direct title would have told us more than any delicate periphrasis.

As, however, the two authors had resolved upon the same name, it is almost a pity that they could not have gone further, and agreed to combine their books. The two put together would have given us a more complete account of the island than either of them does alone. Mr. Gallenga visited Cuba as an intelligent observer of political phenomena, and gave us a very clear account of the complex relations of the various races in the island, and of the difficulties which have led to the insurrection. Mr. Goodman, on the other hand, treats us to a purely picturesque account of Cuban life and manners. He has nothing, or next to nothing, to say about politics. The insurrection was accidentally the cause of his having to leave the island, but he tells us nothing of the evils by which it was provoked. He describes beggars, priests, planters, shopkeepers, slaves, and other varieties of the Cuban population, but he does not express any opinion as to their relations or the reforms which may be needed. He is utterly unstatistical, profoundly indifferent to political economy, and, for anything that appears, cares nothing for religious or political disputes. Mr. Goodman, in fact, appears by his own account of himself to belong more or less to the great family of Bohemians. We learn from his first page that his motive for going to Cuba was the desire of accompanying an intimate friend who had been his chum during three years' artistic study in Florence, and who was returning to his native town, Santiago de Cuba. There Mr. Goodman settled and supported himself, partly by his art and partly by various supplementary occupations, such as corresponding with an American newspaper, and, once at least, appearing on the boards of a theatre. He has evidently a faculty for making himself at home, and it would appear that that desirable consummation is reached with special facility in the unconventional society of the tropics. Everybody in Santiago de Cuba appears to be in the habit of dropping in at the house of everybody else, and receiving an unlimited amount of hospitality in the shape of tobacco and aguardiente. Mr. Goodman recounts his experiences with the utmost frankness, and indeed, if all his statements are to be taken as strictly historical, with a somewhat surprising disregard of ordinary rules of decorum. We are quite unable to say how far an anecdote of a love affair which occupies some of the latter pages of his volume is meant to be a record of facts; and we have some doubts as to whether the young lady was really confined to her convent by a stern parent, and whether Mr. Goodman expects to meet her again in Europe. Judging such revelations by a European standard, we should be inclined to call them decidedly indiscreet, even if names and dates have been more or less disguised. However, the jaunty manner in which Mr. Goodman takes us into his confidence, and his general style of description, savour rather of the novelette in the minor periodicals to which some of his pages were originally contributed, and we may conclude that he would decline to be bound by any strict canons of accuracy. Mr. Goodman's style is indeed throughout affected by a desire to be sparkling at any price. The whole book, for example, is marked by a free use of the historical present. He never condescends to say that such or such a thing happened. It is always "I watch

* *The Pearl of the Antilles; or, the Artist in Cuba*. By Walter Goodman. London: Henry S. King & Co. 1873.

the proceedings" of the convicts, "We are shown over the fortifications," "My friend offers to present me to the company," and so on. Mr. Goodman has a certain amount of humour and of graphic power, but he is over-anxious to be incessantly dawning, and we should have been more grateful to him if he had occasionally descended to the level ground of plain narrative. However we must take the best that we can get, and we may admit that he presents us with a series of sufficiently lively pictures of life in the tropics; and that anybody who wishes to know of a land where he can "burst the chains of habit" and enjoy the frank hospitality of a lazy, good-natured, irregular race, may consult his pages with advantage.

To give any coherent criticism of such a book is rather difficult. Mr. Goodman, we may say, goes through the proper experiences; he has an attack of yellow fever, is imprisoned on suspicion for making a sketch of the fortress, goes out on an expedition with the Spanish volunteers, sees a slave flogged and a rebel massacred, and hears in confidence the private history of a beautiful young Creole slave who is ultimately married to a Cuban gentleman. The most characteristic and amusing part of his narrative, however, is the description of his experiences of a painter's life in Cuba, and perhaps we shall best discharge our duty by briefly epitomizing one or two of the illustrative anecdotes which he relates. Mr. Goodman and his friend set up a studio as soon after their arrival as they could escape from the overwhelming lavishness of Cuban hospitality. The local press described them as "followers of the divine art of Apelles," and fell into ecstasies over pictures which required to be touched before they could be discriminated from realities. All kinds of demands were speedily made upon their talent, from painting portraits down to painting carriages, including the preparation of scenery for the theatre and triumphal arches to welcome Spanish governors. One special branch of their trade was taking likenesses of the dead. At three o'clock one morning, for example, Mr. Goodman was roused from his slumbers and called to a house where the ceremony of a "wako" was taking place. The body, dressed in a tightly-fitting suit of black, was propped up for Mr. Goodman to operate, and a sudden failure of the props produced a lively sensation amongst the audience. The relations and friends were sitting round the body smoking, drinking, and talking. Each new arrival, however, thought it proper to begin by embracing the dead man's boots, and was greeted by a chorus of hysterical lamentations by the assembled relatives. Mr. Goodman appears to have been a good deal more sensitive to the comic side of these proceedings than to their pathos, and considers the howls of the relatives in the light of a pantomimic performance. As their fame increased, the companions had more ambitious work thrust upon them. They had, for instance, to decorate a new shop with a grand allegorical oil-painting representing France in the act of crowning a celebrated chemist; and by the help of plaster busts, and drapery painted in imitation of marble, they erected a couple of imposing statues, one of which had to be appareled in genuine boots. Their greatest success appears to have been the triumphal arch already mentioned, which represented, by the help of wood and canvas, an old feudal castle 45 feet in height by 30 in breadth, inscribed with the names of the military triumphs of the illustrious Captain-general and surmounted by the Spanish flag.

It is plain that no foolish pride prevented Mr. Goodman from turning his hand to any honest method of making a livelihood. Indeed pride would have been out of place in so simple a society. Even begging is there a respectable profession. Cuban mendicants have something of the Edie Ochiltree, though they show more imagination than could be expected from the sturdy Scotch bedesman. Thus Mr. Goodman met a well-dressed lady at a friend's house, who sat down in a rocking-chair, entered into polite conversation, and in taking leave delicately held out her hand for a bit of money. Another beggar was formerly a slave, and obtained his freedom by publishing a volume of poetry, though apparently he did not find it convenient to maintain himself by his literary exertions. Where beggary is carried on by people of such claims to respectability, the dignity of art need prevent no man from sign-painting. The artist, indeed, has to run dangers peculiar to the country. Mr. Goodman tells us a story, which we must confess does not appear to be perfectly intelligible, of his adventures in search of a model. A girl upon whom he had fixed his eyes was the daughter of a laundress, who promised to consult her friends as to the propriety of the proceeding. Whilst she was supposed to be taking counsel, the watchman called on Mr. Goodman one night, and informed him that the model's mother was given to witchcraft, and that it was consequently unsafe to visit her premises without amulets in the shape of powdered glass and sulphur and mustard. Mysterious communications followed, directing Mr. Goodman to leave certain coins under his door, which would pay for a full revelation of the intentions of witches in regard to him. Whether or not these intimations had any relation to the suspected laundress does not precisely appear; but Mr. Goodman, visiting her premises again, was offered a drink which he seems to think was poisonous, and perceived that a fumigation of the house with some very disagreeable odours was taking place. Hereupon he escaped into the street, feeling very giddy, and resolving to have nothing more to do with witches, however attractive might be their daughters considered as models. The story, as we have said, does not lead to any very intelligible result.

A mystery almost equally thick hangs over Mr. Goodman's

accounts of a still more disagreeable adventure in the prison. He was shut up for some time with an intelligent Indian who had been imprisoned for months upon no particular charge, and had no prospect of a trial. The Indian told him encouraging stories of American and other foreign subjects who were locked up without any opportunity of communicating with their friends. Mr. Goodman owed his escape to the good offices of his friends; but the unlucky Indian appears to have been executed not long afterwards. What became of the Americans, or whether there really were any Americans, does not appear. Life under a military despotism has its disadvantages. Mr. Goodman, indeed, tells us a story of the rough justice dispensed by one energetic commander which on the whole is not much more satisfactory. A certain rich Cuban, it seems, had carried off a beautiful Creole to his house in reliance upon his interest with the authorities. Her lover managed to discover her place of detention, and complained to the energetic General Tacón, whose rule offered a brilliant exception to the ordinary manners of Spanish governors. The General sent for the lady and the Lovelace; and after strictly investigating the facts, ordered Lovelace to marry his Clarissa on the spot. The ceremony having been performed, Count Almante—the true name of the said Lovelace—was ordered to return to his home. On the way nine bullets were fired through his body; and the General informed the lady that she was a widow within an hour of her marriage, and the heir to her husband's property. Hereupon she married her lover and lived very happy ever afterwards. Mr. Goodman is not himself a witness to the truth of this anecdote, and we have a suspicion that we have read something very like it before. Assuming, however, that it is an illustration of the best variety of Spanish justice in Cuba, we may suppose that the ordinary rule is apt to be oppressive. Indeed, to say nothing of scorpions and yellow fever, there are obviously many objections to Cuba as a place of residence. A gentleman of a Bohemian turn, however, with a taste for the fine arts, may apparently contrive to lounge away months and years in the island with abundance of cigars, and enjoy the pleasures of indolence more fully than in most civilized countries. If Mr. Goodman had been content to tell his story more prosaically, we should have been better pleased; but we receive a general impression that, from the purely picturesque point of view, the bright skies and brilliant costumes of Cuba must really offer many objects of interest to a traveller who will fall in with the peculiar way of life described.

PRESSENSÉ'S HERESIES AND DOCTRINES OF THE FIRST THREE CENTURIES.*

THE present volume is a sequel to the two already published by the author, under the titles of *Early Years of Christianity* and *Martyrs and Apologists*, describing the external and intellectual conflict of the Church during the first three centuries with Paganism. It presents his view of the internal development of Christian doctrine and the contemporaneous growth of heresy during the same period, and is to be followed by a fourth, which will complete the series. We need hardly remind our readers that Dr. Pressensé, who is perhaps best known to English readers by his work on the Life and Times of Christ, is the leading representative of what is called the Evangelical or orthodox party in the French Protestant Church. That he is far removed from the narrowness of more sectarian Protestantism may be inferred from his presence last year at the Old Catholic Congress at Cologne, and from the explanation he has since put on record of his interest in the movement. He has long ceased, he says, to look for the religious regeneration of France to any of the existing forms of French Protestantism, and he sees in the consent of the Catholic Church to reform itself seriously the only hope of restoring the moral power of religion in countries of the Latin race. It is only natural that, with those sentiments, he should feel especially drawn to the study of those early centuries in which Christian thinkers of every school and creed profess to find the historical evidences of their belief. It is generally urged or admitted by Protestant controversialists that in the fourth century the tide of corruption had already set in, and that, if an appeal is to be made to the Councils and Fathers of that and the succeeding ages, a very plausible case, to say the least, can be made out for the main outlines of the Catholic system. But they are not willing, as a rule, to surrender the testimony of the second and third centuries, though it is in fact necessary to read the ante-Nicene patristic literature through very strong Protestant spectacles if we choose to deny that, as a recent writer in the *Westminster Review* expresses it, the prevalent teaching at the date of the publication of the fourth Gospel was distinctively Catholic, and the earliest authorities available for the canon of Scripture may also be cited for such doctrines as the sacrifice of the altar and prayer for the dead. It will be seen presently that Dr. Pressensé, like other writers of the same school, has failed, notwithstanding his transparent sincerity and candour, adequately to realize the state of the case, though he is too learned and honest a writer not to supply the materials for correcting his own inaccuracies. His doctrinal standpoint, as opposed both to the Catholic and to the rationalistic, is very clearly laid down, though he seems strangely unconscious of its vulnerable points. He insists on the essential distinction between orthodox doctrine and heresy, which latter term is not to be put aside as an

* *Heretic and Christian Doctrines*. By E.-G. Pressensé, D.D. Translated by Annie Harwood. London: Hodder & Stoughton. 1873.

attack on liberty of conscience, but is the proper designation of "doctrines which on some capital point are in direct contradiction to primitive Christianity," and are in fact "always a reaction either in the direction of Judaism or Paganism." And accordingly the great lesson to be learnt from the history of the Early Church is "to repudiate alike the religious radicalism which denies revelation, and the narrow orthodoxy which insists on its own interpretations." But if there be, as is expressly maintained, "a rule of faith more or less obligatory," the obvious question arises as to where the line is to be drawn between what the author calls "fundamental and secondary points," and how both are to be marked off from doubtful or directly heterodox speculations, unless some external standard is recognized. But he objects to the authority of tradition, regarded by writers like Irenæus and Tertullian as paramount, and protests still more strongly against the later authority of Councils, from Nicæa downwards, as a hierarchical oppression of conscience, originally derived from the Montanist heresy. Yet some criterion for distinguishing faith from opinion seems all the more necessary when the principle of development in relation to such fundamental doctrines as "redemption and the Trinity" is admitted. And here Dr. Pressensé parts company altogether with the old-fashioned Evangelical divines, to whom "the mere mention of a history of doctrine would have been a scandal," and speaks with high admiration of Dr. Newman's "scientific" essay on the subject, while denouncing Milner's now obsolete *History of the Christian Church* as "a masterpiece of bigoted ignorance." Indeed he expressly affirms that "theology is the very knowledge which, according to apostolic precept, is to be added to faith." Such a theory is quite intelligible and manageable in the hands of a Catholic theologian who recognizes Church authority as a discriminating test, wherever he may place the seat of that authority, or of a rationalizing theologian who relegates the ultimate decision to the "verifying faculty" or reason of the individual; but it does not harmonize easily with the views of a writer who explicitly rejects the former criterion, and yet insists as emphatically as those who maintain it on the reality and obligations of positive belief.

We must add that this vagueness of general principle appears to us to follow the author into his detailed treatment of his subject. Let us take two instances of doctrines which he evidently holds to be "fundamental"—the Trinity and the Atonement. As regards the first point, he says that Justin Martyr's language proves that he could not have believed in the divinity of the Holy Spirit; that Clement of Alexandria, and indeed Christian antiquity generally, scarcely distinguishes the Second and Third Persons of the Trinity; that with most of the early Fathers "the Word has a beginning," and that all writers before Irenæus regard the Incarnation as "nothing more than a superior mode of revelation or divine illumination." The phrase we have italicized betrays the fallacy which underlies a good deal of this exaggerated method of statement. No doubt a gradual development in the expression, and to some extent in the apprehension, of Christian doctrine may be traced in the ante-Nicene Fathers, if not also in the New Testament, and Petavius, whom the author most unaccountably censures for ignoring this fact, was the first divine who made it his special business to insist upon it, whereby he drew down on himself the elaborate, and on the whole very undeserved, censure of the Anglican Bishop Bull. But it is very possible to exaggerate these discrepancies of early writers, especially when omission is taken as tantamount to ignorance or denial. St. Basil, for instance, in the fourth century, in a treatise on the Holy Ghost, especially written against heretics, studiously avoids any direct assertion of His divinity, which was defined soon afterwards at the Council of Alexandria; but it would be most uncritical to infer that he did not believe it. And we must confess to some surprise at finding a writer so familiar with Christian antiquity as Dr. Pressensé, and especially one who can refer to the works of Dr. Newman, so entirely oblivious of the well-known principles of *viciorum* and *disciplina arvens*, which can never safely be left out of sight in the interpretation of patristic teaching, though it is of course easy enough to press them to an undue extent. He also appears to us to forget that, apart from this consideration, a writer dealing with one subject is not at all bound to mention every other subject which may be thought to have some connexion with it. To argue, for instance, from what Clement of Alexandria says about the true Christian making up for the absence of the Apostles by his purity of knowledge and life, that he acknowledges no other apostolic succession than that of faith and piety, would be a purely arbitrary assumption, even if it were not quite out of keeping with contemporary evidence. The fact is that Dr. Pressensé, though he is familiar with the text of the Fathers, is not sufficiently at home in patristic terminology to have the right key for its interpretation. It has been very truly observed that a student may "employ himself laboriously in the Fathers, and yet attain to as little idea of the rich mines of thought, or the battle-fields which he is passing over, as if he was visiting the coasts of the Mediterranean without a knowledge of history or geology." And to measure their theology by the favourite passwords of modern Protestantism, such as justification by faith, or the error of "sacerdotalism," is not the way to enter into its full meaning. Sacerdotalism or the sacramental system may be, as it has sometimes been expressed, "the *πρωτον* *πινος* of the Church system"; but it cannot fairly be denied that the germs of the error at least are to be discovered by the end of the first century. A writer like Baur, who brings no theological preconceptions to his task, is apt to be a safer guide in

the historical criticism of doctrine than a divine of the modern Evangelical school, though Baur is no doubt sometimes misled by his passion for constructing systems that will run on all fours. And this leads us to mention another weakness not at all peculiar to the author, but common to him with most French writers, whether Catholic or Protestant, religious or secular, which materially deducts from the value and trustworthiness of their criticisms. There is not only a sort of looseness and flaccidity about his general method of treatment which contrasts unfavourably, e.g. with Neander's way of handling the same subject-matter, but he shares to the full that apparently national incapacity for accurate quotation which is a besetting sin of his countrymen. His translations merge into paraphrases which always obscure, and not unfrequently misrepresent, the sense of the original, though he is too honest not generally to give us the means of correcting these inaccuracies in a footnote. Thus, for instance, he quarrels with Neander for admitting, what no sound criticism can deny, that Irenæus taught a real sacrifice and presence in the Eucharist; and he quotes in disproof of it, among other passages, one which really tells entirely the other way, but which he thus renders in the text:—"In like manner He declared the wine (also a created thing) to be His blood; and He thus teaches us what is the new oblation which the Church under the new Covenant presents to God according to apostolic tradition, &c." We have italicized the interpolated or inaccurately rendered words which give an entirely new turn to the sentence. The Latin original quoted in the note is this:—"Calicem similiter, qui est et *creatura* suum sanguinem confectus est, et Novi Testamenti novam docuit oblationem, quam Ecclesia ab apostolis accipiens in universo mundo offert Deo." This is not indeed precisely the language of Aquinas, or even of St. Augustine, but it stands in much the same relation to their language as that of ante-Nicene theology to the more explicit statements of the later Creeds.

We will take one other point, not bearing on any existing controversy, which affords a crucial illustration of the author's inadequate grasp of patristic habits of thought. No one who has studied the development of Christian doctrine can be unaware of the momentous influence exercised for a thousand years on the theological conception of the Atonement by the theory of a ransom paid to Satan, first introduced by Irenæus, further systematized by Origen, and worked out in its complete form, involving a debt on the one side, and the stratagem by which payment was effected on the other, by the Fathers of the fourth century. For centuries this view was generally accepted as a true, though not an exhaustive, explanation of the mystery of redemption; and its last echoes are heard, after St. Anselm had already indicated the theory of satisfaction which was destined to supersede it, in the startling phraseology of Peter Lombard, who calls the Cross "a mousetrap baited with the blood of Christ." Now the author cannot help coming across this theory in his treatment of Origen, and he says quite rightly that it bears evident traces of its Gnostic—meaning, we presume, thereby its dualistic—origin. But with that, and the still more obvious remark that it cannot fairly be held to comprehend the whole of Origen's doctrine of redemption, he dismisses it from view. Not a hint is given of its subsequent development and the wide influence it exerted on religious thought, nor does he appear to be aware that Irenæus, and not Origen, first introduced it into the Church. Yet he quotes at length the classical passage in Irenæus (v. 1) where it is first brought forward, or rather, after his wont, gives a loose and very inaccurate paraphrase of it, without showing any apprehension of its real drift, except in a casual criticism on Baur in a footnote for applying *secundum suadellam* to the Devil and not to man. It is pretty clear from the context, not in the paraphrase but in the original—which by the by is not given in this case—as well as from other passages, that Baur's interpretation of the words is the right one. But Dr. Pressensé insists on twisting them into an irrelevant assertion of human freedom. Anyone who desires to contrast the dry and laborious exactness of German criticism with the more readable and rhetorical, but far less trustworthy, fluency of French exegesis, could not do better than compare this book of Dr. Pressensé's with the earlier volumes of Neander's *Church History* or a treatise on the history of doctrine by Thomasius or Baur. We are far from meaning to imply that the volume is not an interesting one, or that it may not be profitably as well as pleasantly consulted by those who have sufficient knowledge of the subject not to be at the mercy of the writer. We are inclined to think that the First Book, which deals with the heresies of the early centuries, is the most satisfactory portion of it. The account of Manichæism, as rather a new form of Magianism than a Christian heresy, an attempt to translate into Christian language the religious ideas of Zoroaster, is correct enough as far as it goes. It was not to be expected that the author would refer to the revival of the heresy in some of those mediæval sects in which writers like Mosheim and Milner have discovered the little remnant of the true Church in an age of almost universal apostasy. But perhaps the most interesting chapter, because, it exhibits a literature entirely *sui generis*, and with which comparatively few readers have any acquaintance—except from incidental notices in Longfellow's *Golden Legend*, and the like—is that on the Apocryphal Gospels. Of these compositions some had an heretical origin, like most of the Gospels of the Infancy, while others, like the *Testament of the Twelve Patriarchs* and the *Acts of Ptolemy*, are free from any such taint. The claim of inspiration was disallowed in the case of all of them, but their evidence is nevertheless valuable as to the prevalent beliefs of the first and second centuries; and it is

certainly remarkable in this connexion to find such early references to, e.g. the dignity, and even the bodily assumption, of the Virgin, the mysterious sanctity of the Eucharist, the intercession of the Saints, "the anticipated glorification of conventual virginity," in the person of Thecla, the preservation of relics, and veneration of the Cross, in what the author calls "terms of the most abject superstition." The language put into the mouth of the Apostle in the *Acts of Andrew* would alone prove the very early introduction of "sacerdotalism," though the author refuses to see it in that light. "Every day," he is made to say, "I offer the spotless Lamb on the altar of the Cross; His body is truly eaten and His blood truly drunk by the people." It is easy to explain all this as an expression of that "mythological instinct" of the popular mind which ever seeks to materialize and corrupt religion, but the fact remains, supposing it to be a caricature of the dominant system, that the caricature must have resembled the reality.

We have not left ourselves space to do more than briefly indicate the general framework of the volume. The First Book deals in successive chapters with the Gnostic, Manichean, Judaizing, and Montanist heresies, and what the author calls "the first Unitarians"—i.e. the Alogi and Sabellians—and closes with a chapter on the Apocryphal Gospels. The Second Book, on the Development of Doctrine in the Church, goes through the four schools, which are respectively designated the Græco-Asiatic, the Alexandrian—which is the most important, including Clement of Alexandria and Origen—the Græco-Roman school of Irenæus and Hippolytus, and the Carthaginian. The Table of Contents, which contains little beyond headings of chapters, requires considerable enlargement, and all the more so from the Index at the end being a very meagre one. It is due to the translator to say that she has executed her work exceedingly well. The book hardly reads like a translation, and there are not too many English versions of French works of which that can be affirmed.

ABOUT PHEASANTS.*

IT was high time that a popular account of the history of this bird *de luxe* should begin with some more solid information than Daniel's statement that "it was introduced into Europe by the Argonauts"—a statement for the verification of which many persons will be at a loss where to search for authorities beyond the range of Mr. William Morris's *Life and Death of Jason*. And though Mr. Elliott's monograph may be said to exhaust the subject for the curious, no one will regret that Mr. Tegetmeier's skill in bringing to bear upon any department of the history of gallinaceous birds the stores of research which he has amassed has been directed at length into this channel, which has so much to connect it with his works on the poultry-yard and the pigeon-house. With him for guide and mentor, we may fairly hope to be spared absurd exaggerations, and to find reasonable explanations of statements about which doubt might suggest itself. He contents himself, for example, with referring the origin of the pheasant to Asia Minor, with which, in spite of a thousand years' naturalization in the south and centre of Europe, it identifies itself by its Asiatic shyness; but on the question of the earliest traces of the bird in England, he cites much curious matter from old tracts and chronicles ransacked by Mr. Boyd Dawkins, and Mr. Harting in his *Ornithology of Shakspeare*, to show that it occurs as early as 1059 A.D. in a bill of fare, where it seems to be equivalent in value to two magpies, and up to 1512, where in the "Northumberland Household Book" it ranks in estimation at the same rate as a curlew, a heron, or a bittern. To these notices might have been added another, which seems to set the pheasant at a higher premium, in 1170, but which has escaped Mr. Tegetmeier—to wit, that Thomas à Becket, on the day of his martyrdom dined on a pheasant, and enjoyed it, as it would seem from the remark of one of his monks, that "he dined more heartily and cheerfully that day than usual." But enough is advanced to establish the probability that the countrymen of Apicius, the Romans of the Empire, introduced the pheasant into Britain; where, whatever its early fluctuations in value and estimation, it now, as our author puts the case, "from the moment of emerging from the shell to final disappearance between the lips of the gourmet, is the object of the tenderest solicitude of the gamekeeper, the sportsman, the poulterer, the cook, and, finally, of the host who presides at the head of the table." Such a bird deserves to have its nature and habits popularly known; and Mr. Tegetmeier's pages will further this end very materially, discussing as they do the pheasant in the covert and the pen, as well as in the aviary, in all stages of its existence. Practically, the Englishman's concern is with the common species, or Phasianus Colchicus, and its close allies, the Chinese, Japanese, the Scampering, and the Reeves pheasants, of which the last-named carries to the furthest extreme the characteristic elongation of the tail-feathers. The gold and silver pheasants belong to distinct groups, and are only interesting for the aviary and for eye-service.

A good many notes of its original wildness cling to our common pheasant even under all the conditions of acclimatization and civilization in modern pens and coverts. First we may mention the shyness of which it hardly ever gets rid, though it is not uncommon to meet with individual instances of domesticated pheasants, such

as that instanced by Mr. Tegetmeier, which answered "to the name of Dick, liked human and canine society, visited the breakfast-table and the kitchen fire, and slept in his protector's bedroom. The pheasant that could not endure crinolines (see p. 16) is, we submit, an example of correct, but hardly of domesticated, habits. But we believe it to be indubitable that such instances of tameness do not, as a rule, stand the test of the breeding season; and the result of the observations of the acute and experienced naturalist Waterton was conclusive as to the singular innate timidity of the pheasant, which, though apparently got over by systematic efforts, is ever breaking out again on the abrupt appearance of some new object, and eventually baffles all attempts at domestication. It is this inborn timidity or shyness that defies attempts to make the bird breed in our yards, or to cross it with the domestic fowl, with the original of which, the jungle-fowl (a species perfectly domesticable), it is nevertheless allied. Another token of wildness is the great pugnacity of the pheasant, both with his fellows and with the game-cocks, with whom he has been occasionally pitted by way of experiment. Mr. F. O. Morris quotes an instance of a cock pheasant that killed three gamecocks and was itself killed by a fourth. There is something too in its omnivorousness, and still more in its carnivorous tastes, which betokens the "fera natura"; the latter being illustrated by instances of its gorging a slow-worm (whence the fable that it lives on serpents), and of its being found dead with a short-tailed field-mouse in its gullet. Observation of its digestive organs, however, proves that too great an abundance of animal or stimulating food is apt to inflame the "pro-ventriculus," or digestive tube connecting the crop with the gizzard; and in a state of nature, and under favourable circumstances, we should find the pheasant addicted rather to insects, larvae, fruits, roots, and berries, the tubers of the buttercup and silverweed, the oak-spangles, which enclose a grub, and are in effect the *nidi* of a *cynips*, and the wire-worms, of which the bird is so destructive as to deserve the farmer's patronage instead of his hostility, than to such banquets of solid flesh as have been mentioned above. For the kinds of food indeed which it prefers, the pheasant's strong legs and blunt claws admirably equip it; and, though its flight is strong and rapid (it has even been known to break plate-glass windows), as well as sustained enough to cross the sea embankment between Yorkshire and Lincolnshire, where the Humber is four miles across, still it must be accounted a terrestrial bird, feeding, nesting, and rearing its young on the ground. The hen pheasant's nest is ordinarily a ground hollow on a slope, though it has been known to nest in a hedge beside a cart-road. Occasionally, however, she will take to a deserted owl's or squirrel's nest, up a tree, as much as twelve feet from the ground; though whether in such cases she succeeds in safely removing her young to "terra firma," and, if so, how she does it, is as yet, according to Mr. Tegetmeier, apparently *sub judice*.

From the whole scope of Mr. Tegetmeier's observations we should infer that the pheasant in England thrives best when, as in Norfolk, it is in as nearly a wild and natural state as possible. Where the bird is tamest, as in Sherwood Forest, it is found that apoplexy from overfeeding on maize and stimulating artificial food sets a natural limit to an increase which would otherwise be excessive; and it is in such districts of course that the extraordinary weights of from 4½ to 6 lbs. are recorded:—

In all these cases of exceptionally large birds the extreme weight is owing to the fattening influence of the maize on which they are fed, and some are even so distended with fat as to burst open on concussion with the ground as they fall from the gun.

One of the chief problems connected with the preservation of pheasants is, of course, how to be even with the greatest foe to it, the night-poacher. Our author gives useful recipes for getting rid of cats, foxes, hedgehogs, and polecats. He holds the scales, too, very fairly in the often-tried case of "rook versus pheasant." He cites cases where pheasants have sat and reared their young immediately under a rookery; adduces presumptive evidence of the rook's indirect good offices to the pheasant, which is indebted to it for stray pellets and quids dropped from the crowded pouch under the rook's lower mandible, in the transit home to its mate and nest; and finally concludes that, save in exceptional seasons, or where eggs are exposed by mowing, the influence of the rook is not hostile to pheasant-rearing. The carrion crow is a less doubtful offender, and, with jackdaws, magpies, and jays deserves no quarter. But the human biped is worse than all these, to say nothing of the expense of money and ill-blood which it takes to deal effectually with him. A wild instinct and a tempting price in a ready market prompt the poacher to take advantage of the pheasant's ground-quest of food, and too demonstrative habit of proclaiming his roosting-time by a chuckle when he "trees." As Mr. Morris puts it, "the paths they form in thickets invite the treacherous snare; the air-gun can easily reach them on their visible roost, or even a noose at the end of a pole; should they fly, the difficulty is to miss them with a gun; and should any of these means not be resorted to, a villainous sulphur match will bring them down" (*Brit. Birds*, iv. 320). We look with interest to see what panacea is proposed. Three devices are glanced at of more or less efficacy; such as pitfalls seven feet deep with slanting sides, which would no doubt vex and discomfit the poacher, especially in the case of the night-watchers being near; or alarm-guns (an old device which has been greatly improved upon of late years) capable of discharge by the action of a strong curved spring, which is held by a trigger that can be acted upon by several lines set in different directions. Best, however, and cheapest, are the *mooch* pheasants, made of haybands, rushes, or fern, bound with tarred

* Pheasants—for the Covert and the Aviary; their Natural History and Practical Management. In Four Parts. By W. B. Tegetmeier, F.Z.S., Author of the "Poultry Book." London: the "Field" Office. 1873.

twine or wire—or, in many cases, of painted wood—which are tied up in the larch-boughs, and at which the poacher is led to blaze away his powder and shot to his own loss, confusion, and discovery. None of these plans, however, supersede the necessity of night-watching; and yet even this may be done without, if we may accept the suggestions of writers quoted by Mr. Tegetmeier, whose experience to a great extent coincides with that of Mr. Waterton. The gist of these suggestions is the formation of a special poacher-proof covert or two. Enclosures of from ten to two acres planted with spruce and silver firs in a central part of the estate, or as near as may be to the house, kept good by regular thinning, and a mixture of birch or chestnuts for nurses to the spruce, and for the birds to preen their plumage in, form an impregnable roosting-place and stronghold for the cock-pheasants, which, scouring the woodlands from early morn till eve for larvae, roots, and hips and haws, will come back at night to their warm roost among the spruces. These are preferable to the Scotch firs, which have not such horizontal branches, and serve better for the cock's higher roost than holbies, Portugal laurels, and yews, which might be as good a sanctuary for the hens. The larch branches are undoubtedly favourite roosts of the pheasant, but do not offer the same concealment from the quick eye of the poacher. Mr. Waterton's plan is akin to that just noticed, inasmuch as he plants spruce firs fourteen feet apart in the centre of a covert of three acres sown with whins and fenced with holly on a level ground beneath a hill, and bordered with a gentle stream. This observant naturalist did his utmost to attach his birds to their sanctuary, and to wean them from vagrant habits, by feeding them from mid-winter to spring with boiled potatoes, beans, and cabbage; and he too resorted to the wooden pheasants as a foil to the poacher.

Of the three modes of feeding pheasants in the coverts, the least advisable is that by feeding-troughs which open by the pheasant's weight upon an attached bar. Besides being expensive and apt to get out of order, they facilitate the undesirable end of filling the bird to repletion. For feeding by hand, if done punctually and at a set place, it may be said that it is the surest method of making the birds tame, as well as of ascertaining that all is right with them. Best and simplest, however, is the stack of unthreshed grain, with the ears turned inwards, and the bottom of the stack a foot from the ground, at which the pheasant may help itself, a bundle being pulled out and its bands cut every two or three days. Mr. Tegetmeier prescribes a pheasant-hut to serve at once for a shelter and a dust-floor, as well as a safe place for various foods, such as potatoes, Indian corn, and Jerusalem artichokes, which by the way are a great recommendation to a covert in the pheasant's eyes. So, too, are shallow catchpools to hold water; and these things are worth attending to if they tend to keep the pheasant from roaming. For the pheasants generally, and the young ones in particular, it is of great importance to provide plenty of green food. This is especially necessary in the pens or aviaries in which it is sometimes the custom to breed pheasants for the covert; and these should be as much as possible moveable, since ground on which the birds are too long stationary is apt to become tainted with the ova of the gape-worm. The pen of wattled hurdles, sunk a few inches below the surface of the ground, fastened with tarred cord, and netted at the top, unless the pheasants' wings are clipped, is better than the permanent aviary, in that it is more easily shifted. But it should be large enough to afford ample room for a cock and from three to five hens, and across a horizontal pole should be hung a number of faggots or branches for a shelter, a laying-place, and a roost. Many cautions are given in these pages with reference to the pheasant's laying her eggs, if in confinement, where they can be regularly and quickly collected. The male bird in confinement is apt to take to egg-eating, and, having contracted the habit, clings to it as a dog that has killed sheep clings to the taste of mutton, or a ghoul in the *Arabian Nights* to that of graveyard corpses. To remedy this he is sometimes given a wooden egg to tire him of the sport, and at others is cribbed in a loose box in the corner. Another plan is to coax the hen to take to an artificial nest, thinly covered with straw, through which the eggs may drop into a box or tray coated with seeds. Owing to the dislike of the hen-pheasant to incubate in confinement, the half-bred Silky or the pure-bred Game hens are often called in as foster-mothers; indeed any hen that is a good nurse will answer the purpose. A comparison of the hatching of eggs in a pen and in the nest in the woods suggests that, following nature, we should study dry and sheltered hatching-places with a free circulation of air, to cherish the life that lies beneath the shell.

A chapter on the rearing of the young birds strongly recommends that they should be left as much as possible to nature and instinct. Fresh ants' pupæ and canary-seed are the best first food; and next, the invaluable custard which does so much for the young chicks in the *Poultry Book*. There is much diversity of opinion about the quantity of water to be allowed to young birds; but, with the precaution of its being fresh and clean, it seems only natural that the supply should be liberal. That they drink freely in a wild state seems to follow from the observation (p. 71) that poachers in large breeding-places always net any springs within reach of the coops in dry weather, and this often with success.

Before concluding, we must draw attention to Mr. Tegetmeier's partial dissent from the hard and fast rule of shooting down the cocks and saving the hens. Though the flesh of the hen is more juicy, the sportsman feels a pang at its slaughter, and the sumptuary laws of the field and covert have long enforced a provision against it. A post-laureate, who did not set much of a

mark on the last century, refers as follows to the rule and the forfeit for breaking it:—

But when the Hen to thy discerning view
Her sober pinion spreads of dusky hue,
The attendant keeper's prudent warning hear,
And spare the offspring of the future year;
Else shall the fine which custom laid of old
Avenge her slaughter by thy forfeit gold.

There is reason, however, in Mr. Tegetmeier's argument that you may carry shooting the cocks to excess, and may cause disproportion by sparing the hens. One of his correspondents writes that, as a rule, "too much forbearance is shown to hens early in the season and too little to the cocks at the end of it." He would adapt one or two small coverts as feeding places for stock birds, and spare these, but kill freely elsewhere.

THE TONGUE NOT ESSENTIAL TO SPEECH.*

WHAT is a miracle? The world at large would have been spared no little amount of distraction, and our library shelves would have had a great deal of space for works of more tangible and permanent worth, had disputants on the nature and significance of miracles been compelled to define in strict terms what they understand a miracle to be. An English controversialist has by no means that ready way of evading the difficulty which the German possesses in the ambiguous use of the word *Wunder*. However widely English thinkers or writers may disagree in their understanding of what constitutes a miracle, it is agreed on both sides that a miracle is somewhat really and essentially beyond a merely wonderful thing. To excite wonder and to defy explanation are qualities which go no way at all towards making up the idea of a miracle. A thing may be matter of wonder to-day, and not only clear, but commonplace, to-morrow. The same thing may be, like the electric flash, the wonder, even the terror, of some minds, and the scientific instrument or the plaything of others. To talk of sending a message to the East or West Indies and having an answer back in half-an-hour would have been, fifty years ago, to suggest a miracle to probably every man living; and who knows how many things which would be dismissed as miracles or impossibilities now may be the most ordinary things in the world fifty years hence? We may as well vary our opening question by asking what are impossibilities? Most people would probably say offhand that an impossibility is what cannot be done at all: that a miracle is what cannot be done under the existing laws of nature; but that these laws may be in exceptional cases, and by the fiat of a higher power, suspended or overruled. The question still remains, what is meant by laws of nature? Is it such laws as we at the present time know to exist, or such as we may have ascertained to exist, say in fifty years' time? At all events, must we not be prepared to find many things which once were deemed incredible, impossible, or miraculous, now made thoroughly clear and of everyday occurrence?

An event takes place before our eyes, or is told us by witnesses of good repute as having been seen by them, or currently reported among them fifteen centuries or so ago, which is utterly incompatible with all that we know of natural possibility. What are we to say of it? Are we to argue the interference of a power over and above nature, or simply to say that our senses or our witnesses have played us false? The proofs may be too strong for us summarily and with perfect satisfaction of mind to set the fact aside. What then will a man of fair, or let us say of sceptical, mind do? There may be minds of a paradoxical or fanatical cast to which the very inconceivability of the fact may be an incentive to belief. *Credo quia impossibile est*. Be it however said, in justice to the fervid African, who, if an ardent believer, was certainly no illogical driveller, that this famous saying of his meant no more than that the fact of a thing having taken place which was impossible in nature or to man made him believe it to be the act of God. Of the effect upon a mind oppositely constituted we may practically judge from the frank admission of Gibbon that "the stubborn mind of an infidel is guarded by secret incurable suspicion." Whatever the evidence, he rejects it rather than admit what seems the only admissible alternative. It is simply a question of pre-existing bias. "The Arian or Socinian who has seriously rejected the doctrine of the Trinity will not be shaken by the most plausible evidence of an Athanasian miracle." Doubtless he might say the same thing of the bigot on the other side. But what does Gibbon himself do when staggered by the overwhelming evidence for what could only be accepted, if at all, as a miracle—the well-known case of the African martyrs who retained the gift of speech after their tongues had been cut out by the roots under orders from the Vandal Arian Hunneric? To his instincts as an historian the proofs of the story were not to be set aside if historical evidence was to be admitted at all. He states the evidence with his usual fairness, yet he is utterly unable to submit his reason to what is not otherwise to be spoken of than as a "supernatural gift." All he can say of it is, that "it will command the belief of those, and of those only, who already believe that their [the martyrs'] language was pure and orthodox." However much he might spurn it as an explicit canon of logic, he would in practice admit that, as a fact, the mind does and will find in its own inner stores an habitual belief or tendency to believe, on which it proceeds to admit readily

* *The Tongue not Essential to Speech; with Illustrations of the Power of Speech in the African Confessors.* By the Hon. Edward Twissleton. London: John Murray. 1873.

a new accession to its convictions, and to erect thereupon an addition to its fabric of belief. Rightly or wrongly, it is hardly to be denied that mankind do practically go in such matters by that illative sense seated in the mind and anterior to all external elements of belief, which forms one of the primary points of accident in Dr. Newman's *Grammar of Assent*. Anyhow it is not altogether with his wonted complacency or cynical suggestion of fraud that Gibbon, after a sneer at the specious miracles of the African Catholics as being assignable with more reason to their own industry than to the visible protection of Heaven, leaves without further comment "the one preternatural event which the historian may condescend to mention" as something which will "edify the devout and surprise the incredulous."

It would probably have brought some relief to the mind of the historian in this dilemma had he become acquainted with the physiological facts brought together by Mr. Twisleton in his recent little work upon this subject. To have learnt that no miraculous influence whatever need be dragged in to account for the continued speech of the African confessors, but that phenomena of the like kind are fully authenticated and by no means uncommon in the records of recent surgery, would have taken away all reproach from the authority of history, whilst leaving no scope for triumph to the upholders of superstition. It may be thought strange that, with so much mental activity and so intimate an acquaintance with what was going on in the world of literature and of the intellect in general, Gibbon should not have hit upon the reference to this case in Conyers Middleton's *Free Inquiry*, published in 1748, in which, discussing the supposed miraculous powers of the early Church, he disposes of the African confessors by citing two cases mentioned by Jussieu, the eminent surgeon of Paris, in a paper before the Royal Academy of Sciences in 1718. One of these was the case of a Portuguese girl born without a tongue, who talked as distinctly and easily as if she had one; the other that of Pierre Durand of Saumur, who at the age of eight or nine lost his tongue from ulcer or gangrene. The latter case had been made public eighty years before by a surgeon of Saumur, named Roland, who made it the basis of a small treatise entitled *Aylosotomographie*, published in 1630 and dedicated to Dr. Mark Ducaun, Principal of the Academy of Saumur, a Scotch physician by whom his attention had been directed to the case. Of this work, now rare in the original, a Latin version appeared in 1672 in the *Ephemerides Germanicæ*, by Dr. Rayger of Presburg, a scientific series analogous to the *Transactions* of our Royal Society. Though stories are told of several sufferers under the persecution of French Protestants at the Reformation having similarly retained their power of speech, the Saumur case is the earliest which has rewarded the labours of Mr. Twisleton, whose interest in the subject was aroused by reading a passage in Sir John Malcolm's *History of Persia*, which spoke of well-known cases parallel to that of the African confessors. A memorandum drawn up by him for insertion in *Notes and Queries* was communicated to Jean Milman, and is referred to in the second edition of *Latin Christianity*. Further inquiry brought to the author's knowledge additional cases which have been incorporated into the interesting little work before us.

The next instance in point of time to that of the boy of Saumur is that of a man known as Joannes the Dumb, of Weesp, near Amsterdam, who had had his tongue cut out by Turkish pirates rather than renounce Christianity, but whose speech came back after the shock of a flash of lightning. This case is told, in 1652, in the *Observationes Medicæ* of Dr. Nicolas Tulp, a distinguished anatomist, and burgomaster of Amsterdam. The third case is that of the Portuguese girl reported upon by Jussieu, and further attested in a letter (September 3, 1707) by Dr. Wilcocks, then chaplain to the Embassy at Lisbon, afterwards Bishop of Rochester, published in Wanley's *Wonders of the Little World*. The earliest case recorded in England is that of Margaret Cutting, a young woman of Wickham Market, reported at length in the *Philosophical Transactions* in 1742 and 1747. Her tongue had dropped out while being syringed for cancer at the age of four, when the child, to the amazement of all round, said, "Don't be frightened, mamma; 'twill grow again." Though no tongue or even uvula was to be seen, she pronounced both vowels and consonants articulately, even those which seemed to require the help of the tongue, as *d, l, z, n, r*. Reference is made in this Memoir to the passage in which the Justinian Code speaks of venerable men, besides the victims of Hunneric, "*qui abscissis radicibus linguæ penas miserabiliter loquebantur*." To the same effect are the cases of Zâl Khan, reported by Sir John Malcolm, and of the Emir Fars, told by Mr. B. Wood, Consul at Tunis, the operation upon the latter victim having been witnessed by Colonel Churchill in 1824. Not only is this punishment of common occurrence in the East, but experience has established the impression that no material loss of speech is the result, if only the excision be complete—that is, not that of the tip of the tongue only—and symmetrical, so as not to leave the member ragged or divided. With this view the executioner has a customary fee paid him to ensure the neatness of the operation. For refusing to pay fifty tomanes (25*l.*) Mahdee Kooly Beg, sentenced by Fath Ali Shah to lose his tongue at Teheran, as reported by Dr. Dickson, physician to the British Legation, found himself speechless till he had the pluck to complete the operation upon himself with a razor. So common are instances of the kind in the East, that Dr. Wolf speaks of meeting thirty people at Bokhara who spoke articulately without their tongues. The fullest and most satisfactory case reported by Mr. Twisleton is that of Mr. Robert Rawlings, who within

ten years ago was still living to tell the tale of an operation whereby the whole body of his tongue had been removed for cancer, not, as in the previous cases, through the mouth, but by excision under the chin, between the lower jaw and the hyoid bone. The report of this case by Mr. Nunnely, the operating surgeon, given here at length, is one of great interest, as are also Mr. Twisleton's own record of an interview with the patient, and the minutes of Sir Charles Lyell and Professors Owen and Huxley, who subsequently examined and conversed with him. The series of cases ends with one reported by Professor Syme, and with a letter from Sir James Paget, who has six times performed the operation, and who adds that in each case the patient could talk quickly and intelligibly, the pronunciation of the lingual sounds, as *d, t, th*, alone being imperfect.

Upon the whole, Mr. Twisleton, who sums up his proofs by appending the text of all passages or documents bearing upon them, is fully entitled to infer that all questions involved in the phenomenon of speech in the African confessors lie strictly within the domain of natural science, and that there is no reason for asserting or suspecting any miraculous intervention in the matter. We can scarcely expect that Dr. Newman, who has declared his belief to have been by no means withdrawn after the memorandum in *Notes and Queries*, will be converted by the ampler evidence brought forward in the work before us. Under a system which, as he describes it, "is from east to west, from north to south, hung with miracles, which are the Church's glory," one portent less or more can make little difference. It is enough that he admits this especial miracle to be withdrawn for the present *quoad* controversial purposes. To those who look simply to the exactitude of history and the trustworthiness of human testimony, it is of no slight interest to have the facts of the case so satisfactorily set right.

HESTER MORLEY'S PROMISE.*

THERE is always something subdued and quakerish, but strong in its very distinctness and simplicity, about Miss Stretton's writing. She evidently, too, takes pains with her work, and is not content to fill up so much copy with the first outpour of undigested verbiage that may occur to her. We know when we read her that she has given us the best of which she was capable; and that she has not put off her public with that disdainful "it will do" which has been the ruin of so many authors, writing for the immediate guinea, not for an enduring reputation, and careful only to give the least they can for their money. Miss Stretton is free from any taint of this suicidal dishonesty, this contemptuous indifference to the inherent worth of her work; and so far we are grateful to her, and disposed to judge her faults leniently.

Miss Stretton excels in a Dutch-like description of men such as John Morley, the bookseller of Little Aston, that grave, solemn, sorrow-stricken man, "stationed on the northern side of life, where no laughter or splendour of sunlight could fall upon him." He is a deacon in the Dissenting chapel, which, with its "pretentious portico supported by four square pillars of red brick, and surmounted by a pediment and architrave of blue and yellow tiles," ends and gives its name to the narrow little sunless street where he lives; and his house is in accordance with his sorrowful heart and sombre nature. It is weather-beaten and dingy; gloomy in its chill sunlessness rather than restful by reason of quiet shadows and calm silence; and, though old, has none of the picturesqueness of antiquity about it. "The roof formed three gables, and the moss and houseleek grew along the gutters and choked up the water-pipes"; and it stood on the "north side of the street, where it was never gladdened by the sun, and looked as if a perpetual cloud overshadowed it." In this gloomy house the melancholy bookseller lives with his honourable trade, his rare old volumes, his capable binder and humble friend Lawson—who has a genius in the way of gold-leaf, bevelled edges, and artistic "tooling"—his memories of his dead young wife, and his little girl Hester, nine years old when the story opens. This little girl is one of those premature children whom authors will go on trying to depict, though they are simply unrepresentable. When the best is done with them that can be done, they are no better than a caricature; and paternally-minded readers are always thinking what they should do were they afflicted with such elfish children in their nursery, and would probably choose cod-liver oil and a cheerful school as the best methods of exorcism known to them. Hester has been suffered to grow up without apparent training, if there has been more than sufficient restraint; and having no untoward humours, she has not developed into anything rude or coarse or wilful. On the contrary, her father's sadness has reacted on her, and produced the inevitable results of preternatural gravity, distressing leanness, big eyes, quaint sayings, and unchildlike religiosity. At this early age she knows the value of a promise; and when she makes her little vow to be always as a daughter to the light and shallow, vain and frivolous young woman whom John Morley brings home as his second wife, she holds its obligation binding on her when she reaches womanhood and has to judge and act for the best in all ways. We suppose that, if novelists conscientiously confined themselves to the facts and possibilities of human nature, what Mr. Henry Kingsley calls their "quaint trade" would soon come to an end; but, in spite of the necessity there seems to be for irration-

* *Hester Morley's Promise*. By Hester Stretton, Author of the "Doctor's Dilemma," &c. 3 vols. London: Henry S. King & Co. 1873.

ality, we cannot but think it a pity when interest is sought to be excited by a character or mode of thought and action out of keeping with normal experience. And though *Hester Morley's Promise* is carefully wrought in a literary sense, the characters do not strike us as thoroughly natural, however vividly portrayed.

We will take some of the principal persons in succession. First, there is John Morley himself, the dull, sorrow-stricken, and deeply religious man, deacon in a strict and godly community of a Calvinistic turn, who takes for his second wife a creature young enough to be his daughter, full of worldliness and levity, because he has conceived a passion for her which a person of his sect and temperament would have considered a temptation of Satan, and from whom he would have fled rather than have cherished her as a sweet and lovely gift of God and nature. Then, when this wife has dishonoured him, and he has lived his whole after-years in a condition of unresigned despair—which again would have been scarcely the fruits of his faith, or consistent with the heartfelt religiousness of his earlier presentation—he can undergo the strange complication of her death-bed. Hitherto he has allowed no one to mention her name before him, nor the name of Robert Waldron; but now he can kiss the dying child of her sin, dying in the arms of his own daughter, and in the presence of its father, his wife's former lover; and he can even, when Robert falls senseless, raise him in his arms, and, "with a woman's tenderness of touch, carry him into his own room and lay him upon his own bed." This sublime perfection of resignation at the end, which has been utterly wanting to him during the course of his trial, comes with a certain shock of inharmoniousness, at least to those who do not believe in sudden conversions. His marriage with a "daughter of Moab" at all was scarcely in keeping with his character and profession; his lifelong brooding over his misfortune was not more so; but this death-bed reconciliation is the strongest exposition of morbid and unnatural psychology that we have seen for a long while.

Is Rose the wife more natural? In the beginning light and silly, not in love with her husband and cherishing a sentimental fancy for Robert Waldron, it is perhaps likely enough that she should elope with the younger man when the temptation comes, but not likely that she should leave her lover surreptitiously before the birth of their child. She is a woman of no mental strength and of no delicacy of conscience; not bad so much as silly, and more vain than vicious. She proves both her want of power and her want of real conscience in the later scenes, when she sways hopelessly into Hester's hands and towards the husband she had not loved, because she is ill and friendless, and when she meets her seducer without shame or remorse. Such a woman would have clung to her lover with the tenacity of weakness. She would not have had either courage or sense of guilt strong enough to detach her at the very moment when she most needed support, or, if she had, she would have carried her burden to the last, and have been too strong for the pitiful part assigned her. We think the mingling of shallowness and fixity of purpose, of indifference in the past and spontaneous tenderness as time goes on, contradictory and not a true study of character. An author has a perfect right to make his people act as he pleases, but as the Gods themselves were bound by necessity, so is he bound by certain laws of art and science, and he has no right to make them act in any way inconsistent with themselves.

Again, would Mr. Waldron have countenanced for a moment the project of his son's marriage with Hester? It seems to us uncovenanted sinners a strangely indelicate idea that the man who had seduced the wife should wish to marry the daughter, though she is only a step-daughter. And it seems just as odd that a pillar of the Church, who objected to a daughter of Moab as a wife for one of his deacons, should not see as clearly as any ordinary gentleman would have seen that the marriage of his son and that deacon's daughter was utterly impossible under the circumstances. We greatly wonder that Miss Stretton should have chosen such a theme. Even in her cool, quiet, unfeverish hands it is but a doubtful one, and full of ugly suggestions.

We are no better pleased with the character of Miss Waldron than with some other things in this book. It is a spiteful portrait, and therefore badly done. A woman of uncertain age who makes love to the two young pastors in succession, and who shows such miserable jealousy and rancour, is not a pleasant person to contemplate. A little more tenderness and generosity in the handling would have made all the difference between a portrait spoiled by ill-nature and one redeemed by generous judgment. Some of the bits about her, however, are very good, though others, like the parcel of old clothes sent to Hester, are unworthy of the author, and more like Mrs. Henry Wood than Miss Hester Stretton:—

Miss Waldron looked upon her brother's sin as a cross expressly constructed for herself, and weighing more heavily upon her than upon any one else. She grew a hundredfold more terrific in her Bible classes and mothers' meetings; and expatiated with extremeunction upon the judgments of Heaven. The religious poor generally enjoy being alarmed. They have been driven out of some of the strongholds of superstition, which are not without their charms; and they like to taste again the thrill and creep of awe, with which they were wont to glance back over their shoulders for the hobgoblins of former times. Miss Waldron invited them to peep with terror into the mysteries of Divine Judgment; and she became popular with them. A great work began in her classes; and she said that her brother's fall had been the conversion of many souls.

The scene wherein little Hester in her white nightgown brings the letter of poor runaway Rose to the husband of the one sinner and the father of the other, and the way in which the two men meet face to face with their sorrow and their shame, is well done.

It is quiet and strong, simple and graphic, and has a praiseworthy absence of fine words. And Miss Stretton has well brought out the injustice of the different judgments passed by the world on the man and the woman when both have equally fallen. Hester's innocent wonder why it should be so is a very true little trait; and where much is strained, these smaller touches of nature, the finer points of truth, are very welcome. The character of Lawson, dreamer and would-be murderer, though a mere sketch, has perhaps most consistency and power. But we wonder why he did not finish his work, after his first failure, on Robert. He had plenty of opportunities; and in the unsatisfactory state of the police and of public opinion in Little Aston he might have knocked him on the head in his master's house more effectually than he did before his door, and with as complete impunity. The strange coincidence of his murderous blow failing twice, once on Robert and once on Rose, shows a certain paucity of invention that we are sorry to see. Besides, a man like Lawson, who had dedicated himself to revenge, would not have been balked. One failure would not have been final, and the very craziness of his muddled brain would have helped to concentrate and intensify his design.
